ADDRESS
RURAL NEW-YORKER,
78 Duane St., New York City.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

ANSWERS TO CORRESPONDENTS.

H. N. Lynn.—We do not know of any farmer having the "Clawson Wheat" for sale; but you might find it at some of our seedsmen. Try DAVID LANDRETH & SON, Philadelphia, Pa.

By this mail I send in paper box a section of a running vine. It had no tendrils, nor does it climb like many other vines spirally on poles or strings; but its leaves are used as claws to fasten itself to any object in reach which it can grasp. A single plant, at this season of the year, will completely cover and hide any unsightly object, as a brush-heap, stone-pile, shrub or fence, etc. Will you please give us a name for it?—I. W. BRIGGS.

The vine sent us is *Clematis Virginiana*, also known by several common names, such as Travelers' Joy, Virgin's Bower, etc., etc. It is a native climbing vine, growing abundantly in swamps and along the banks of streams, attaching itself to support by its petioles, which are given off in pairs, serving the purpose of tendrils, as seen in the grape and many other similar vines. The flowers are small, white, and borne in cymes, which make a very handsome appearance during the blooming season. But the most remarkable feature of this plant is the fruit; the long, feathery tails attached to the seed, separating like tufts of cotton or wool. It is a beautiful vine, although common, and well worthy a place in every garden.

J. W. B.—Grape-vines can be grafted, and sometimes it is an object to propagate them in this manner. But it is too late for grafting this season, and before the time comes around for performing the operation, we will endeavor to give an exhaustive illustrated article on the subject. If we should do so now, we fear that many of our readers would forget all about it before the time arrived for grafting, and then they would ask for a repetition of directions.

E. W. C.—To keep sweet potatoes over winter in the Northern States, the essentials are to dig carefully, dry the tubers thoroughly, then pack in dry sand, chaff or leaves, and place in a temperature of 60 to 80°. A warm room is preferable to a cellar, as the latter will seldom be warm and dry enough to prevent rotting.

A Reader.—The large insect you send is commonly known as the Harvest Fly, although in some localities it is called a "locust," but its correct name is *Cicada*. HARRIS, in his "Insects Injurious to Vegetation," named it *Cicada canicularis*, but some of our entomological authorities think this species is not different from the one described many years ago by THOMAS SAY, under the name of *Cicada pruinosa*. It is a common insect, and its "drumming" may be heard during the months of August and September, and is far from being pleasant music, especially when they are abundant.

C. E. R.—We do not know who has a young Short-Horn bull for sale, but presume an advertisement in our columns would bring the information.

As to plowing sod for a corn crop next season, we would advise waiting until spring, then turn it over and plant. This is the usual practice, and we think the best way to manage sod land to be planted with corn.

H. E. E.—It is too late now to think of sowing Hungarian grass this season, as it is an annual, like corn, and will not withstand the winter. Every spring we have something to say on the sowing of fodder plants, Hungarian grass among the number, hence you have only to watch our columns devoted to field crops to obtain the desired information, and, at the proper season, making use of the same.

Pattie, Orange, N. J.—Your question as to extracting the perfumes of leaves and flowers, is answered by a little note in an English paper, the Journal of Horticulture:—Jasmine, Rose, or any other flowers may have their scent preserved by the following mode: Place them between thin layers of cotton wool, dipping these into the finest olive oil, and sprinkling a small quantity of fine salt on the flowers alternately until an earthen or wide-mouthed glass vessel is quite full. Tie the top close with a bladder, and place the vessel in a south aspect exposed to the heat of the sun, and in fifteen days when opened a fragrant oil may be squeezed away from the whole mass, little inferior, if Roses are made use of, to the dear and highly-valued otto or attar of Roses.

Mrs. M. Glidden.—Please tell me in the RURAL how to treat my Amaryllis. It is three years old, has never blossomed. The leaves were broken off last year, but fresh ones are now eight or ten inches in length. Some say that the small side bulbs should be removed or it will not blossom. Must I do so? ANS.—Doubtless the bulb was weakened by the leaves being pulled off. You say it is three years old. It is scarcely time for it to bloom. Removing the offsets will not effect its blooming.

Successful Amaryllis culture depends upon the following: In its season of rest, place it in a temperature between 40 and 50°, and keep it dry. During its growing period, give it warmth and moisture. Any garden soil mixed with sand and leaf-mold will suit it.

Mary B.—I wish to know how to pursue the study of botany without the aid of a teacher. Am familiar with the technical terms of the different parts of a flower, such as sepals, petals, stamens and ovaries, but cannot trace and know nothing about the orders. Is it possible for any one to obtain a botanical knowledge without a great deal of time and labor, and what books are required? I am a teacher of music, and have often thought that, were I proficient in botany, it would greatly aid me in earning a livelihood. By answering the above you will oblige.

The study of botany we believe to be one of the most useful, as well as refining, of the sciences, and we would that we might inspire that belief in every girl and boy in the land. It is not that dry study that so many deem it. Either the pupil is at fault, or the teacher has not his heart in his work. We do not know of a book more plain or comprehensive than "Gray's Garden Botany."

Commit to memory nothing that you do not fully understand, and if possible procure specimens of plants to examine as you study. By so doing you will find that an otherwise perplexing lesson is rendered simple. Tracery requires care, thought, and a critical examination of the parts of flowers, which are ofttimes so small as to require the use of a magnifying glass. The practical botanist is familiar with the distinctive marks of all the orders, and is thereby enabled to determine at once to which it belongs; and it is with these distinctive marks and the terms expressing them that the pupil has first to occupy himself. We should say, with your present knowledge of botany, that two hours a day of diligent study for three months would enable you to trace ordinary plants of the garden and woods;—this does not include grasses, ferns or mosses. You will find upon examining a flower of any given order what its distinguishing characteristics are; for instance, take the order Compositæ. This comprises nearly one-ninth of all the flowering plants, and is distinguished at once by its capitate flowers and united anthers; the Labiate, or Mint family, with its square stems, bilabiate corollas, ovary deeply four-parted, forming four little nuts, or achenia—all distinct marks and readily recognized. And so on with most other orders.

The beginner is prone to exaggerate the difficulty of committing to memory the terms of botany; but sooner or later he finds his mountains have resolved themselves into mole-hills. We are in need of botanists, and have no doubt that were you proficient in this study, you could command a situation in some one of our many schools that would well repay for your time and study. Such knowledge might also profit you in connection with the agricultural and horticultural press.

Wm. Taylor.—Will you tell me, through the RURAL, why salt mixed with ice or snow, producing salt water, causes cold? Is not the liquid warmer than ice?

ANS.—No, it is colder than the ice. The freezing point is lowered by this combination. When a solid body is made to liquefy without the aid of external heat, the heat which is essential to liquefaction must be abstracted from contiguous bodies which are thus made colder. The degree of cold is, in a great measure, proportionate to the rapidity of liquefaction. The principle is latent heat. If we take a pound of ice at 32° and a pound of water at 172°, the temperature will be found, when the ice is melted, but 32°. A quantity of heat (140°) sufficient to maintain the water at 172° has thus disappeared or become latent. It has been absorbed by the ice, and the temperature of those bodies supplying the heat is proportionately lowered.—Give us seasonable questions, good readers. Why tantalize us with thoughts of freezing mixtures with the thermometer at 90°?

A Rural Reader.—Blue Grass Seed may be sown in the fall at the same time and in the same manner as other hardy species. Some farmers sow it with their rye and wheat, others delay sowing until spring, putting it in with oats or spring wheat, but we prefer fall sowing for all of the hardy grasses. If it is not desirable to sow grass seed with grain, put it in alone, and early enough to insure a firm hold of the soil before cold weather. Sowing grass seed alone is not in general favor among farmers; but we have practiced it for years, and with such good results that we should be loth to return to the old double-crop system of seeding down a meadow.

Two to three bushels of Blue Grass seed should be sown per acre to insure a good stand, and very lightly covered. A light brush made of a branch of a tree, and drawn over the ground, will cover the seed sufficiently. Alfalfa, or Lucerne, as it is called, should be sown in spring, as the young plants are quite tender, and would scarcely withstand the cold of a Missouri winter. Sow broadcast and about fifteen pounds to the acre early in spring, and cover with a brush. After the plants have become well established they may be hardy enough to withstand the climate in your locality.

Trees, Seeds, Plants, &c.

SEEDS OF CEREALS.

The repeatedly expressed desire to obtain samples of the CEREALS raised at BLOOMSDALE, and now on view at the Centennial Exhibition, has induced us to prepare for sale, Packages of the same. These grains were originally collected by us from various sections at home—from Louisiana to Canada inclusive—and from the best sources in Europe, with the object to compare all, and determine the best for future use. Each package will contain one ounce each, properly labeled, of *Thirty* varieties of Wheat, (a selection from fifty-eight sorts) *nine* of Barley, *Eleven* of Oats, *Two* of Rye; quite sufficient if properly cared for to determine their relative worth; information which must be of high value to Agricultural Societies, Grange Associations, Farmers' Clubs, and the country at large.

Price of single Package, forwarded by mail, POST-PAID, securely packed, $5.00.

DAVID LANDRETH & SONS,
21 and 23 South Sixth Street,
PHILADELPHIA.

PRICES UNPRECEDENTED.—Low rates for Nursery Stock. Send for Catalogue. THE ART OF PROPAGATION; a book on rapid multiplication of stock, for Nurserymen, Gardeners, &c. Mailed for 50c. Address T. JENKINS, Winona, Col. Co., O.

Traveler's Guide.

CALIFORNIA.
Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?
The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.
This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.
This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.
For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Pass'r Agt.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO,
via Cleveland.
Leaves Erie Railway Depot, foot of Chambers St. New York.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars
The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend as a present, at our lowest club rate—only $2.15, including postage.

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

MOORE'S RURAL NEW-YORKER.—This king of Agricultural papers has entered upon its twenty-sixth year, under the most favorable auspices. It is the determination of its publishers to furnish a brighter and better paper than ever. In style, type, matter and editorial ability, there is no paper of its kind that at all compares with it.—*Trempealeau (Wis.) Republican.*

Wit and Humor.

A RATHER COOL PROCEEDING.

An old man entered a saloon and thus addressed the barkeeper:

"Mister, will you please be so kind as to give me a lemon?"

"What do you want with it?" asked the barkeeper.

"Wall, I just thought I would ask you for one seeing that you had a pretty big stock on hand. Come, old fellow, wont you give me just one?" and he gave the mixer of liquors a sly nudge in the ribs.

"Yes, I guess I can give you one," was the answer.

The old man smiled, expressed his thanks and went out. In about half an hour he returned.

"Well, what has brought you here this time?" asked the barkeeper.

"Oh, mister you are so kind I thought may be you might n't object to giving a poor old man a glass of ice water; won't you?"

"Certainly, sir. I will give you a drink of water," was the ready answer, and the barkeeper poured out a glass for him.

"If you would only just be so kind as to put a little sugar in the water now, I should ——"

Before he could finish the sentence the sugar was placed in the glass by the obliging barkeeper, whose curiosity was aroused to know what was going to be done with the sweetened water. The old man drew a chair out to one side, sat himself down and placed the glass between his knees; then drawing a pocket knife and the lemon he remarked—"Well, pardner, I'm just going to have the best drink this hot day you ever see."

SPARKS AND SPLINTERS.

The chief of hum-bugs—the mosquito.

"Ma, dear," said an intelligent pet, "what do they play the organ so loud for when church is over? Is it to wake us up?"

The letter L represents fifty. Why does it also represent nine hundred and ninety-nine? Because L just precedes M, which represents one thousand.

"Was it your eldest daughter, madam, that was bitten by a monkey?" "No, sir; it was my youngest. My eldest daughter had a worse misfortune—she married a monkey."

An exchange remarks that "some people are wholly unable to appreciate delicate irony." We have observed this ourselves, particularly in the case of washerwomen and shirt bosoms.

It is said that the old Romans also loved office. But they never had the feeling which an American constable has—never felt that their shoulders carried over half the burdens of government.

A poet, after looking about over life, has come to the following conclusion:

Oh, I wouldn't live for ever—I wouldn't if I could;
But I needn't fret about it, for I couldn't if I would.

"Now, there's a finished gentleman for you," said a fireman, as he gazed upon the pieces of the engineer that had been scraped up and gathered to his fathers, after his last attempt to run a train on nothing.

A Western paper says:—"Talk about the wind blowing the grasshoppers away! One of them faced Monday's gale for an hour, and then yanked a shingle off a house for a fan, saying it was awfully sultry."

The disgusted Britisher who concluded that the American national tune was the spit-toon, is revising Shakspeare for young Yankees. He has got as far as—"'Tis true, 'tis spitty, and spitty 'tis, 'tis true."

Mc Crispin—"Quite right to get a pair of shoes Molly. Your foot 'll look illegant in leather." Molly—"But sure I can't pay for them till Christmas." Mc (after a thoughtful pause)—"Troth, and it's a pity to hide such a purty fut, acushla."

Popular Hymnology.—Mistress with a ritualistic turn: And how did you like the festival service, Martha. Martha (from the country): Lor, mum, it wor beautiful! There was a lot o' men and boys a marchin' round and round the church with flags and a-singin' "Onward Christy Minstrels!"—*Punch.*

At the Hudson depot, the other day, a negro named Punch sat down on a quarter of a pound of powder and some matches in his pistol pocket. The matches ignited, the powder exploded, the basement of the african's trowsers disappeared, and in an instant the quondam wearer was butting his head into the ceiling.

Women are going into the insurance business, and when a comely woman enters a man's office, hitches up her chair, places a fair hand on his arm and begins to talk about policies, he feels as though his life ought to be insured pretty soon. And this feeling is greatly augmented should his wife chance to drop in unexpectedly during the interview.

COMPETITION THE LIFE OF TRADE.

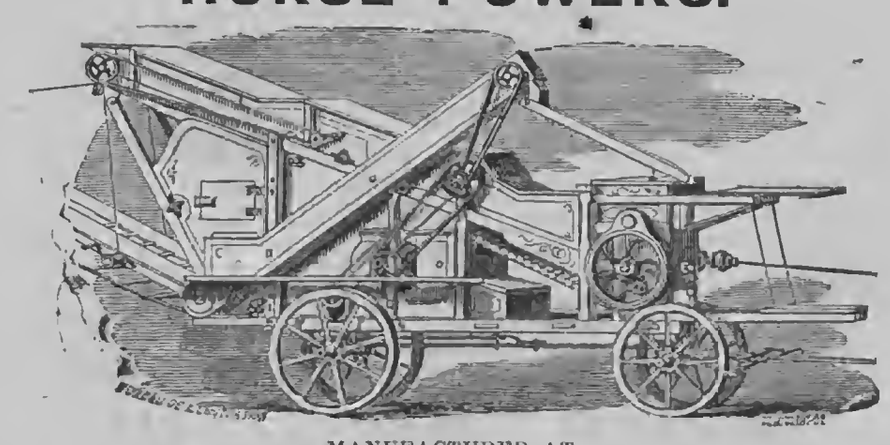
BUILDING PAPER!
FOR SHEATHING, ROOFING, DEAFENING, CARPET LINING, AND PLASTERING

These are the best and most economical goods; impervious to dampness, heat and cold. Send for samples to B. F. HALE & CO., 56 and 58 Park Place, New York.

The Buffalo Pitts Threshers
AND
HORSE POWERS.



MANUFACTURED AT
The Pitts Agricultural Works, Buffalo, N. Y.,
Have been known throughout the United States for over thirty years as the
MOST PERFECT AND LIGHTEST-RUNNING THRESHERS
in the world.
FOR THE HARVEST OF 1876
I am offering a large assortment of these Celebrated and Popular Machines, adapted to either Steam, Water or Horse Power.

They combine all the latest improvements which are to be found in other threshers, and some which are found in the Buffalo Pitts alone.
They are built under the direct supervision of Practical Threshermen (who have followed threshing as a business), and all changes made are the suggestions of experience in the field, and are thoroughly tested there before adoption.
Threshers will appreciate the great advantage of this over
Theoretical Threshing Machine Building.

The greatest care is given to using the very *best material* and to having the work done in the *most thorough* manner.
My facilities for purchasing materials at lowest figures and for economical building are surpassed by none and the machines are offered at the lowest prices at which
The Best Material, put up in the Best Manner, can be Afforded.
In comparing prices Threshers will please note differences in material, workmanship and finish and bear in mind that
The Best is the Cheapest in the end, even though the first cost is greater.
Various sizes are made:—24-in., 28-in., 32-in., and 36-in. Cylinder Threshers and 4-horse, 8-horse, 10-horse and 12-Horse Powers.
Repairs are for sale in almost every county in the wheat-growing country, *at my list price.* For Catalogues, Prices, &c., &c., address
JAMES BRAYLEY, Buffalo, N. Y.,
or 44 South Canal St., Chicago, Ill.

The American
CIDER MILL
will grind more Cider from the same weight of apples than any other mill in the world. Send for Circulars.

SEND FOR CIRCULAR of the best Paint in the world to RUBBER PAINT CO., Cleveland, O.

TELEGRAPH Wanted, 50 persons to learn. When qualified assisted to positions. Address with stamp, J. ABERNETHY, Supt., Cleveland, O.

Moore's Rural New-Yorker became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

Arboricultural.

THE WEEPING SOPHORA.

Among the many superb weeping trees suitable for places of limited extent, the Sophora has few superiors. It is a native of Japan. It was introduced into European gardens more than a century ago and has long been known in this country, still comparatively few good specimens are as yet to be found in our public parks or private pleasure grounds. In fact, we might say that a really well grown specimen is an exception to the general rule.

A few years since we had the accompanying illustration engraved from a sketch made by our own artist of a noble specimen of this tree growing in the grounds of S. B. Parsons & Co., Flushing, N. Y., and we now opportunely reproduce it in connection with an article by Mr. Mr. Parsons on "Horticultural Education," which appears in the present issue of the Rural, and will be continued in the next. The original or parent species of the Sophora Japonica is an upright-growing tree, reaching a hight of 40 to 50 feet, and producing large bunches of rather small, yellowish, pea-shaped flowers late in summer. The wood is very hard and compact, and it is thought might be used as a substitute for boxwood in wood engraving. The bark exhales a peculiar, strong odor, and it is stated in *Nouveau du Hamel* that it has a peculiar effect upon those who work in the wood while it is green. Loudon states that this was first discovered by a turner, who, while at work on a piece of the wood recently taken from the tree, was seized with colic, which obliged him to leave off. The following morning he resumed his work, and the same thing having occurred to him again, he sent for a neighboring turner, and afterwards for two others, who were all alike seized with colic.

In an old French work on forest tree culture the Sophora is mentioned as rivaling the Robinia Pseud-Acacia (our common locust tree) in robustness of habit and rapidity of growth, and even surpassing it in the durability of its timber. In view of the fact that of late years our common locust tree is being destroyed by the well-known Locust borer (*Cyllene robiniæ*), it might be well for arboriculturists to test the *Sophora Japonica* as a promising substitute, especially in the Middle and Southern States. The seedlings and the seeds could be obtained quite cheaply from nurserymen abroad, if not in this country.

There are several varieties of this species of Sophora, but all are chiefly valued for ornamental purposes. The best and most highly prized is the Weeping Sophora, or *S. pendula*.

The specimen from which our illustration was copied is about 15 feet high and the branches extend nearly or quite 20 feet, forming underneath a commondious and elegant bower. The leaves are dark green and pinnate, as shown in the sketch of a greatly-reduced twig in the right hand upper corner of our illustration.

The variegated Sophora is also a pretty variety, but, being rather delicate, is not considered worthy of much attention. The Weeping and other varieties are grafted upon stocks raised from seeds or cuttings of the original species.

In addition to the Japan Sophora, we have at least three species native of North America, but unfortunately they are all natives of the warmer parts. The *Sophora tomentosa* is a low-growing shrub, 4 to 6 feet high, with yellow flowers. It is a native of South Florida and west to Texas. The Showy Sophora (*S. speciosa*) and the Silky Sophora (*S. sericea*) are also found in Texas, from whence we have received seed from our correspondents. But the Japan species grow to a larger size than our natives, and are altogether preferable for ornamental purposes, even for the South, still it would be well to try the native species, as some of them might prove of value in the more genial and protected localities.

THE WEEPING SOPHORA.

Landscape Gardening.

HORTICULTURAL EDUCATION.

BY S. B. PARSONS.

I approach my subject with the embarrassment, one must always feel in endeavoring within the compass of a few columns to glance even at the wide field to go over, which required years of Loudon's laborious life.

I shall attempt only to throw out a few hints based upon the experience of some thirty years or more of country life, every day of which has brought with it the necessity of some thought upon landscape gardening and trees and flowers.

In a new country like ours the efforts of men, whose muscle is their only wealth, are first devoted to the production of grain and other articles which are essential to support life. When their labor has produced more than they need themselves, and money begins to flow in from their surplus produce, the higher gratifications of the palate are desired. Then they plant fruit trees and when these produce they become connoisseurs. Hence it is, that all over our country we will now find men of ordinary education and limited means, who will discuss the merits of favorite varieties of apples, pears, grapes, or other fruits as understandingly as men of the highest culture and with the largest opportunities which wealth gives. Beyond this gratification of the palate, however, men of ordinary taste and culture rarely go, and it is reserved for a higher civilization to imitate nature by developing art, to cultivate the aesthetic elements of country life and to surround country homes with the highest constituents of natural beauty. I think it is safe to assert that as an art, landscape gardening is higher than either painting or sculpture. The sculptor must have a quick perception of form, a knowledge of anatomy, and a power to throw his ideal into material shapes.

The painter needs these with an added appreciation of the effect of colors. The landscape gardener needs them all, with the exception of anatomy, and also needs much more. He must have an intimate acquaintance with all trees and plants; must be familiar with their forms at full age and with the shades of color in their foliage; must know whether their roots grow on the surface like the elm or deep like the hickory, and must know also the nature of the soil which they require. He must also be a good surveyor, understand thoroughly the principles of drainage and have a general acquaintance with vegetable physiology. He should also know, like the sculptor, how to materialize his ideal, how to make a gay, charming place, a quiet subdued one, or a park of baronial pretensions. He should have a quick eye for natural beauty, and an ability to harmonize his plans with the general features of the country in which they are executed. He should also have a quick imagination and a readiness to look forward into the vista of half a century and see what then will be the development of his plans, what forms his groups will then have assumed and what the shape of the noble trees which he planted when saplings. A landscape gardener should also be a rural architect, for it is essential that entire harmony should exist between the dwelling and the grounds, that the plans for each should come out of the same brain. He should know the relative strength of different woods and stone and brick and iron, and should be familiar with all the appliances of luxury, which science has unfolded for man's pleasure. He should be able to take the cream from all science and, uniting it with the highest kind of art, make himself an artist as much superior to the painter or the sculptor as the majestic tree or budding leaf or brilliant flower is superior to the pigments or marble with which they work. These materialize

their ideal through dead matter; our artist does the same through living, growing, vital forms. The work of one remains the same through centuries; that of the other develops new beauty every year.

The year before COLUMBUS discovered America, he walked about the Escurial gazing upon its beautiful pictures. In the country of his discovery, a young oak was then lifting up its forehead to the sun. The pictures are now the same that they were or have grown dim by age, while the young oak has budded and grown year by year into a sturdy tree, under whose wide spreading branches my children shout and play to their heart's content. Is not he the highest artist who works with these living, growing, vital materials?

To make my thoughts more clear, I will tell you how I would educate a boy for landscape gardening and rural architecture, provided I could have his time at my control, between the ages of fifteen and twenty-five. Assuming that at fifteen he has enough of Latin to read Virgil and enough of Greek to read Homer, I would place him for two years at chemistry in our scientific school, connecting with it the modern languages. At the end of this time he would be able to analyze any soil and tell its constituent parts as accurately as the merchant tells the constituents of the cloth he sells. Knowing what is deficient in any soil he could apply the needed fertilizing elements. The preparation of the soil is the first step in landscape gardening. His third and fourth year should be occupied by the general course in the scientific school, where he would obtain a good knowledge of surveying, of architectural drawing, including linear perspective, of botany, mineralogy, geology and civil-engineering. All these would be of great aid in his profession. Botany is of course essential. Surveying and topographical drawing are equally so.

In laying out a place, the first thing to be done is to survey it and mark the precise position of every tree upon it. The next thing is to prepare a map of it, and after careful examination of the ground to lay out the roads and paths. These can then be made by inferior hands. Drains must also be made, and there are many other things to be done which would require the knowledge to be gained only in a course of civil-engineering. For the fifth year I would place him with a skillful architect, where he could more thoroughly apply the instructions he had received at the scientific school. The sixth and seventh years should be passed in some nursery establishment, where the variety is as large as possible and where his eye would be thoroughly educated to the peculiarities of each tree or shrub. This period should be marked by close reading and study on vegetable physiology, arboriculture and kindred subjects.

The winter half of the eighth year I would send him to the Tropics, to the shores of the Amazon, to the valley of Caracas and to the passes of the Cordilleras and to Central America, where he can see nature in her finest combination of grandeur and beauty. No one can thoroughly appreciate the capabilities of plants unless he has seen the wonderful luxuriance of tropical vegetation. No sight of my earlier days dwells so vividly in my memory, as that of some of these scenes. The summer half of the eighth year could be usefully occupied with the lectures at Edinburg, on vegetable physiology. There is here an excellent botanic garden, and the students have the opportunity of study from living specimens, and of listening to lectures illustrated by numerous diagrams. It appeared to me to be as thorough a course in vegetable physiology as could be desired.

The ninth and tenth years could be profitably occupied in traveling. A rapid trip to India and Persia would give a knowledge of the peculiar, yet beautiful architecture of those countries. A winter in Italy and Greece would be essential to the formation of correct architectural taste, a few months would be sufficient for the rest of Europe and not less than six months to England. For the highest existing development of art in the imitation of nature, England is an epitome of the whole world, and a landscape gardener need desire for this purpose no other country. He has there the finest study possible under every beautiful phase which the combination of taste and wealth can furnish. Two or three summers could be very profitably spent there in studying the finest places.

Our student however, is desirous of speedy practice in his profession and cannot spare these three summers. His taste however, can be further cultivated by devoting his seasons of recreation in each year, to traveling in the most beautiful parts of our own country, thus making himself familiar with nature in all her forms. Mt. Desert, the Adirondacks, the Alleghanies, the prairies and oak-openings of the West, each afford a different and attractive study. Now you will doubtless say that few men are able to do these things; few men can afford to sustain a son in such a course of study for ten years. Except the traveling however, it is no more expensive nor does it require more time than the study of the law. He will come out of this training, a thoroughly well-skilled man in all the requisites of his profession, and if wealthy gentlemen who own costly country places, could be made to appreciate such ability, his profession would be remunerative. That in time they will so appreciate it I do not doubt, but what are the facts now? Do you not think that such ability ought to ensure an income of three thousand a year, or ten dollars for every working day in the year?

Yet the fact is, that nearly all those who are forming costly country places—men who do not hesitate to give a thousand dollars for a horse, or two thousand for a shawl—think that such a charge would be exorbitant, for merely laying out grounds or planting trees, and would be perfectly shocked at the idea of paying in addition to this for plans which cost much labor of competent draftsmen.

One of the most enterprising gentlemen I know, who, by an unusual combination of wealth and taste, has made twelve acres of land the most beautiful place in America, tells me that it is often comical to witness the expression on the faces of wealthy gentlemen who visit them, when he shows them his new trees a foot or two high, costing perhaps twenty-five dollars each. They look at the tree, then at him, think him extravagant if not crazy, and then go to the city and buy a piece of furniture for five hundred dollars, that would be as truly beautiful and useful at fifty. The fact is, that these men have spent their best years as merchants, they have no scales wherewith to weigh such improvements, and they can neither realize nor understand their value.

An appreciation of art follows wealth however, and I do not doubt that any who has courage to undertake such a course of training, would find the profession of a landscape gardener remunerative. But while pleading for an artist, I do not wish to forget the thousands who cannot afford to employ such a man, but who must lay out their ground themselves, aided by the intuitive taste which every wife or daughter has, in a greater or less degree. For these I will endeavor to throw out such hints as may be useful.

There are two things which are essential in all places, plenty of air around the house and entire seclusion by hiding your boundaries. Therefore no trees should be sufficiently near the house to shade it. The sun is a great purifier, do not shut it out. To increase the apparent size of the grounds and to insure seclusion, all your boundaries should be planted with evergreens. These will afford a dark and rich back ground against which can be embroidered all the finest trees and shrubs. If the place is occupied the whole year, a large part of the planting should be evergreens, if only for the summer, it should be mostly deciduous. When we reflect that for at least half the year in our Northern and Middle States, deciduous trees are without foliage we will see how important it is to plant for the winter; to select trees which are in full beauty at that season, and which will give the fresh greenness of summer to the winter landscape. This it is, which in winter constitutes so great a charm in English pleasure-grounds, where the eye will rest on the glossy greenness of the Laurel, the Kalmia, the Rhododendron, and other hardy evergreen plants.

I have mentioned two desiderata in all grounds, sun and ventilation around the dwelling. A third one is equally essential, plenty of open turf space. Do not plant trees or shrubs according to the old rule, which was to throw a handful of potatoes in the air and to plant a tree where each one fell. Plant in groups and masses, leaving broad expanses of clear turf over which the eye can pass, catching glimpses of cozy nooks and arbors and vistas. I am, however, becoming rather discursive, and will reserve practical details for another article.

The Apiarian.

FACTS ABOUT BEE KEEPING.

IN the RURAL of Aug. 12 is an article on bees, from the "Industrial Moter," that contains statements tending to deceive people who have had no experience in bee keeping. The article says: "It is estimated that 70,000 of our people are engaged in apiarian pursuits." This "estimate" has no substantial proofs to rest upon; and was a mere "guess" of a writer in one of our bee papers about a year ago. I think that 15,000 is nearer the truth, judging from a long experience in bee keeping in several States. "Some of them," says the Moter, "sold, the last year, from 50,000 to 100,000 pounds of honey each, the product of their own bees." No man can keep in one place over 80 to 100 families of bees; and estimating the average quantity of honey that each would annually produce at 22 lbs., the Motor's figures, it would require 4,500 families of bees to produce the 100,000 lbs., and to be located in about fifty different places, not within three miles of each other. Nobody has any such number of apiaries; and the above quotations, and the assertion that Mr. HARRISON of California has a net income from bees of $25,000, are not reliable. Bee keeping, however, in California is vastly more profitable than in the Atlantic States; and the yield of honey there ought not to be cited as proof of what can be done here.

"The wax produced is estimated at 20,000,000 lbs.," says the Moter. Now, wax is only made from combs in hives where the bees die, and a hive full of combs will not generally produce over one pound of wax. There are, according to the Moter, 70,000 bee keepers in the United States, averaging 28 hives each, (I will now allow the Moter's figures to show the humbuggery of its article from its own words) making 1,906,000 hives in the entire country; and if every family of bees in this country, even taking the extravagant numbers of the Moter, should die, and their combs be made into wax, there would be only 1,900,000 lbs., while the Moter says the amount is 20,000,000, made from the combs of only such families as perish during the year! This is a sample of the nonsense and falsehoods that are being spread over the land, by parties interested in selling hives and bees. I think that 100,000 families of bees would cover all that exist in the United States, out of California.

The Moter continues: "The profits realized by keeping bees averages from one to two hundred per cent. on the capital invested. It is a business anybody can carry on. Students frequently support themselves by keeping bees; and poorly-paid ministers often depend more on these little, industrious creatures than on their parishioners." Yes, the profits are sometimes one or two hundred per cent; but quite as often the beginner fails to get any profit for years, or loses a part, or his entire stock of bees. I resided, some years ago, near Hamilton College, Oneida Co., N. Y.; and a student brought 70 families of bees there to "support himself," and at the end of four years, all his bees had died but five or six families. A student or a clergyman may, in some cases, make a little money by keeping bees; but I think more lose their investments than make money by them. As a fair illustration of what occurs to half the beginners in bee keeping, I will state a case. When I removed from Oneida Co., N. Y., to New Jersey, I gave a clergyman, who had retired from active duty in his church, 22 hives of bees to keep on shares, and at the end of three years he had only four families left, and in one of the best localities for bees in the State. The great trouble is to *winter* bees successfully. Bee-houses, cellars, and all other places are subject to losses in winter, and no kind of hive or management has been discovered that enables bee keepers to winter their bees safely under all circumstances. Mr. QUINBY, the noted apiarian, lost as large a percentage of his bees, before his death, as other bee keepers; and it is, perhaps, safe to say that one-half of all the bees in the Northern States die every severe cold winter, and that we now have no more bees in this country than we had ten years ago.

Another example of the false statements floating about in the papers in regard to bees, is the assertion of the Moter that "a machine has been constructed that turns out combs mathematically correct;" and then it goes on to talk of "the great gaining of time to the bees it is to furnish with ready-made combs superior to those made by the bees!" Now, Mr. Editor, what can we do with such lying writers? The only artificial combs made in the United States are simply comb *foundations*, and are only used as guides for the bees when they commence their combs. They have no cells—only indentations on each side. A little strip, say half an inch wide, may be secured in honey boxes as an incentive to the bees to come up into them, and to build combs for surplus honey; and this is all they are good for. The fact that they are made of pure wax, disqualifies such foundations from being used, except in very small strips as guides, because no one would like to eat pure bees-wax in his comb-honey, which naturally is a very different thing from manufactured wax.

There is a bright and a dark side to bee keeping. A great deal depends on the locality. Where white clover does not exist extensively, bee keeping would be a hazardous business; and even in the best localities it is not a business that any person can depend on to make a living. One may succeed, and he may not. He may prosper for some years, obtain a large number of families of bees, and a very severe winter may destroy nearly all of them. Even warmly-built winter bee-houses are not safe in very cold winters.

Now, suppose that we, in imagination, call on 100 men who have been, or now are keeping bees in movable comb hives in a good locality for bees—men who keep from five to fifty families—we find that ten of them have lost all their bees, and have given up the business in disgust. Twenty have fewer families now than they had five years ago. Thirty "hold their own" from year to year, the increase of each season about equaling their winter losses, and the balance have increased their stocks somewhat. "What is the cause of your losses?" "O, sir, our cold winters." "Have you made money by bee keeping?" "Some seasons we make a little, and in other seasons nothing. Mr. —— and Mr. —— are very successful. They had about a thousand pounds each of cap honey last season, each having about 50 families."

We will now call on Mr. ——, who has 600 families. "How many differently located apiaries have you, sir?" "I have eight—keep a man to attend to each in swarming time." "Do your bees increase much?" "I get a good many swarms some seasons, but I don't increase my stock, taking out winter losses. In fact, to tell the truth, I had more bees five years ago than I have now." "What are your annual net profits on your 600 hives?" "Year before last I cleared about $1,000; last year was a poor season for bees, and I just came out "whole;" this year I shall probably clear five or six hundred dollars. Bee keeping, sir, is not the fortune-making business that we read it is in the papers."

Probably a trip among the bee keepers would result somewhat as I represent the case above.

Linden, N. J. T. B. MINER.

AN apiarian of Maryland has secured a beautifully-marked breed of bees which he names the Albino. The markings are these:—Beautiful yellow bands; from the bands to the end of the bee is quite white, or a bright silver color; heads dark velvet color, differing from the Italian.

Insurance Department.

INSURANCE NOTES AND NEWS.

Exchanging Insurance Policies.—At least one-third of all the life insurance companies in existence five years ago have since abandoned the business. Most of them made some sort of arrangement to re-insure their risks. The remainder are winding up in various degrees of insolvency. The failure of these companies caused a great deal of irreparable loss to their policy holders. Many of the insured were in bad health and could not be again insured with other companies. The same thing may occur again whenever the business of a company ceases to be profitable. Such is and has been the case for years with several of them. They would close out their business at any time if opportunity offered or could be created. When they do so a repetition of the old evils may be expected unless some preventive measures are taken. The greatest injustice is sometimes practiced in exchanging policies from one company to another. Every policy has a certain value. The laws prescribe the amount of this value and the company is required to have an equivalent sum to the credit of each policy. This value usually increases rapidly year by year, consequently those which have been longest in force are most valuable. When a policy lapses the company gains and appropriates the sum to its credit. The same thing occurs whenever it is voluntarily surrendered, as in the cases where they are exchanged from company to company. The profit to the companies and loss to the policy holders is made by giving a new policy having little or no value in exchange for an old and valuable policy. Millions of money have been made in this way. Companies that are doing a profitless, if not actually a losing business, are preparing to re-insure for the sake of the illicit gains to be made. The only way to forestall this kind of enterprise and to protect one's self from something closely allied to robbery, is to refuse peremptorily to exchange either company or policy. There can be no compulsion in this matter. One or other of the companies must carry the risk, and if *all* the risks of the retiring company are assumed and guaranteed nothing is gained by exchanging, though a great deal may be lost. There is always a deposit of a hundred thousand dollars with the State authorities that cannot be withdrawn while there is one policy in force. This is the best of security and becomes greater in proportion as other people's policies are exchanged. Therefore, hold on to your policy. Pay the premiums promptly before they are due. Pay by draft or postal order so as to have something to show that you have done your duty. You *know* nothing about the value of your policy, nor that of the one offered in exchange, therefore don't swap. If you are strongly tempted by the apparent desirableness of the offer write the *kind* of policy you have, the number of thousands insured, the annual premium paid, the notes, if any, given, the age at which it was taken and the present age, also as nearly as you can the kind of policy offered you and send it to the RURAL. In reply you will receive the advice of one skilled in these things, honestly given, and *wholly without charge*.

Dairy Husbandry.

CONCERNING THE MARKETING OF OUR DAIRY PRODUCTS.

If there is anything more than another which is a distinguishing characteristic of the English merchant and stamps his superiority over that of other nations, it is his commercial enterprise. English trade extends in all directions and embraces a most wonderful variety of products. England imports largely from many countries to supply her own wants, and so familiar are her merchants with the markets of the world, that they know where to buy cheapest and where to sell at the most profit. One would, at first thought, hardly suppose that a people requiring an immense supply of food products from abroad for its own consumption would also engage in supplying other markets than its own, and yet such is the fact, and so thoroughly do the English merchants understand the needs of foreign markets that a brisk and profitable trade is not unfrequently obtained in exporting the very goods which they have imported.

In dairy products England is our best customer, and it is doubtful whether our own merchants are any better, if indeed they are so well, informed in regard to supply and demand and other circumstances likely to affect prices as the English shippers. At any rate, the prices for our goods are largely controlled by the English dealers, and a decline in cable quotations has a wonderful effect in shaping sales, not only on the goods to be exported, but on those used for our home consumption. It has come to be a truism that the 100,000,000 pounds of cheese which England annually takes from us controls the price on the 300,000,000 pounds produced; and this must be necessarily so, for if the shippers are buying our best cheese at from 9 to 10c., it cannot be expected that home dealers will go into our principal markets and pay two or three cents per pound more than the regular rates made to the foreign trade. We never have been fully satisfied with the manner in which the export trade in dairy products has been conducted. In many instances there is a lack of capital among our merchants, and they do not buy so much on their own account and seek an outlet for the goods, but their office seems to be rather that of an agent who buys for his principal, the English shipper. He often takes heavy risks, and is satisfied to get a small commission for his services. Heavy houses like those in London and Liverpool are not very often found in this country, and many of our merchants do not seem to be ambitious to open trade outside of old and established channels. Of course it is a comparatively easy matter to sell directly to the English shipper and take such profits as the times and circumstances warrant, according to the London or Liverpool standard; but we cannot expect to get as good prices as if we should go into all the markets of the world. So long as we tie ourselves exclusively to one market and allow others to select the best places for trade, we must expect to take a lower level in the scale of trade, since those who purchase from us buy to make money, and if they cannot get goods low enough to clear a margin above freights and handling, they are not going to engage in the trade.

But why not treat directly with all nations requiring dairy goods, instead of allowing others to occupy this place? English statistics show that England exports both cheese and butter, but the general impression is that all the dairy products made in Britain and all that is sent there is consumed by the British people. Large quantities of European butter are sent to South America. A favorite brand in Peru and Ecuador and other States along the Western coast is that made in Denmark. The Danish butter made for the South American trade is put up in tin packages, with the covers soldered so as to exclude the air. These packages weigh from 6 to 20 pounds. The tins are coated on the outside with a peculiar red-colored varnish, and so excellent is the butter and so well is it preserved in these packages that a red-colored package of the Danish style is considered a good guarantee of quality and meets with ready sale. Danish butter brings what some of our dairymen would consider a very high price. Very little, if any, is sold less than $1 per pound, and according to Prof. SKOELSKEE of the Royal Agricultural College in Copenhagen, who is now in this country, a much larger price than that named is often realized for it. Danish butter also goes to China and India, where it brings correspondingly high rates.

Now, we see no reason why the United States should not supply the whole South American trade. We certainly ought to ship butter to South America as quickly and as cheaply as either the English or the Danes. At the prices named there certainly ought to be a handsome profit for somebody, and perhaps after our trade was fully established some of this profit might stick to the hands of our dairymen. One thing, of course, it would be important to do, and that is—fine quality and proper packing must be insured. We must confess that American butter is not always up to the proper standard of quality, though our best butter makers can, and do, make as good as any in the world. Shippers, therefore, would need to have some system of inspection, some guarantee that the quality and packing were in every respect perfect, otherwise there would be liability of reduction in the present established prices; for the crowding of any market with a mixed quality of goods put up after a certain style and brand must soon ruin the reputation of the trade and give foreign butter a preference.

Danish and Swedish butter has of late acquired high reputation on account of its excellence and uniformity. This has been partly due to the system of making and partly to the system of packing and inspection, whereby nothing is allowed to be sent abroad to foreign markets that can be classed as inferior. The poor butter is used for home consumption, being sold, of course, at a reduced price, according to quality. The care taken in shipping a uniform and excellent article has given Swedish butter a high name in England, and it is frequently sold in the London market at a price equal, if not superior, to the best English make.

ESTABLISHING AN AMERICAN HOUSE ABROAD.

American dairymen are obtaining comparatively low prices for their goods — both butter and cheese—and it is a question whether something is not due for this state of things to our system of marketing. If our merchants were more enterprising in opening up other channels of trade, it is believed better prices could be realized. We need to extend our trade to all the markets of the world, dealing directly with those markets, instead of allowing another nation to make a profit on our goods in them. It has been suggested that an American house be established in Liverpool and London for the receipt and disposal of American dairy products in England, and efforts have from time to time been made to induce some of our well-known cheese merchants to go abroad and establish such a house. Indeed, it has been proposed that a number of leading factories should unite together to keep such a house well supplied with cheese, either to be sold on commission or by an agent in the employ of said factories. In such case, it will be seen, the factories would ship their goods direct, dispensing with the middlemen, who now take a considerable share of the profits.

It has been urged that an American house could not be successfully established in England, that the English cheesemongers would combine to overthrow any such project; but it is not easy to see why an American house could not be made successful in that country. If our factories had confidence in those having the management of such an institution and sent it their best goods, those goods would be wanted and could be sold, despite any combination of London or Liverpool dealers. Should prices decline much further, it is not improbable that some such organization will be formed and the attempt made to sell goods from first hands, or direct from the factories, through their agents in England. We can name more than one leading factory which is willing and anxious to enter into such an arrangement, and the only question of success would be the selection of certain men as agents who from their well-known business relations with dairymen have obtained their confidence. The project is by no means a visionary one, and in time, we doubt not, will be tried.

KEEPING BUTTER FOR FAMILY USE.

A CORRESPONDENT inquires for a good butter package for family use. He says:—"The wooden tubs and packages, or at least all those I have tried, leave an oldish taste to the butter next the wood when butter is kept in them for several weeks. Stone crocks keep the butter sweeter than wood, but they are awkward things to handle, and are also very liable to get cracked and broken."

The Tilton Package figured in the "Practical Butter Book," page 145, is not open to the objections complained of. It is an iron package, the inside enameled with porcelain, and has a metallic lid. It is provided with a bail to facilitate handling, and can be used for other purposes besides butter. We have been using one of these packages during the past year for keeping butter for family use, and we find the butter always sweet on the sides of the package; in fine, the whole mass keeping sound and in good order. In this package there is no soakage or leakage; the porcelain lining gives off no taste, while the air is excluded, or cannot pass through the sides and bottom, as it not unfrequently does where wooden packages are used. We are now (Aug. 17) using butter made and packed in one of these packages during the spring, and although butter made at that season is not regarded as the best for keeping during the hot months, still we find it sweet and sound, with no appreciable difference in flavor from the time it was put down. It is well to have butter (not intended for immediate use) covered with brine, or with a cloth on which is spread a thin layer of salt, the great point for its preservation being to exclude the air as perfectly as possible. Butter, to keep for any considerable length of time, must, of course, be properly made. If the buttermilk is not thoroughly expelled, it will be short-lived and soon acquire a rancid or "oldish" taste, which latter expression, we take it, means an early stage of rancidity.

COMPOSITION OF AMERIGAN FACTORY CHEESE.

PROF. CALDWELL of Cornell University has been making some analyses of American cheese. In the several samples of whole-milk cheese obtained from different parts of the country, he finds the several constituents in the following proportions:

FACTORIES.	Water.	Ash.	Fat.	Caseine, Sugar, &c.
N. Y. Factory Cheese, No. 1..	31.41	3.53	37.88	27.18
N. Y. Factory Cheese, No. 2..	35.68	3.60	35.15	25.57
N. Y. Factory Cheese, No. 3..	35.24	3.23	35.68	25.85
N. Y. Factory Cheese, No. 4..	34.73	4.05	35.57	26.65
Mass. Factory Cheese, No. 1..	34.18	3.02	35.92	28.88
Mass. Factory Cheese, No. 2..	33.05	3.73	34.19	29.53
Me. Fac. Cheese, Jersey milk	28.11	2.71	41.03	28.15
Wisconsin Factory Cheese..	35.40	3.34	34.05	26.12

Most of these cheeses, it will be seen, contain a pretty large percentage of fat, and especially is this the case with the Factory Cheese No. 1, the amount being nearly 39 per cent., while the Maine Factory Cheese made from Jersey milk is only about 2 per cent. richer, it containing a trifle over 41 per cent. of fat.

Comparing the analyses above with the composition of a very fine cheddar cheese analyzed by Prof. VOELCKER, and which Prof. V. says was one of the finest cheeses he ever examined, we find that the American cheese is richer than it by nearly 4 per cent. of fat. The following is the composition of the Cheddar Cheese as given by VOELCKER:

	Water.	Ash.	Fat.	Caseine, Sugar, &c.
Extra Cheddar Cheese..	33.92	3.85	33.15	29.18

Prof. CALDWELL, we notice, arrives at the same conclusion as that given by VOELCKER, viz., that a chemical analysis is no true test of the quality of a sample of cheese, and this fact is fully borne out by the observation and experience of others, it being well known that some manufacturers will make what *appears to be* a richer and better cheese from milk lightly skimmed than other manufacturers can make from whole milk. And VOELCKER remarks that "one of the chief tests of the skill of the dairymaid is the production of a rich-tasting and looking, fine-flavored, mellow cheese from milk not particularly rich in cream."

On comparing the analyses of CALDWELL with those of VOELCKER on American cheese, we find that the average percentage of water in CALDWELL's samples is a little larger than those of VOELCKER'S, and this is doubtless attributable to the difference in age of the respective cheeses. We regret that Prof. CALDWELL has not seen fit in his report to give a more particular description of the several samples of cheese analyzed, as regards taste, mellowness, and apparent richness under the tongue.

The Herdsman.

WATERING COWS IN THE STABLE.

THE following excellent hints on watering cows from the Live Stock Journal is worthy of attention at this season, when preparations can be made much cheaper than during cold weather:

In answer to a number of inquiries, we propose to give, even at this unseasonable period, some considerations upon this subject. It is an improvement worthy the consideration of all dairymen. There is really every argument in favor of watering cows in stalls that can be given for feeding them in stalls. It is as important that they should be able to drink without molestation as to eat in peace. Every one knows that master animals take a pure delight in keeping the weaker ones away from the spring or watering trough. These underlings must wait till the others go away, and in cold weather this exposes them too long, and frequently they go without water in consequence. Accidents also happen from their slipping on the ice that accumulates around the watering place. Then, water given in stable may be moderated in temperature, so as not to chill the animals like ice-water in the cold air. The water drawn in a comfortable stable will seldom be below 50 degrees. There have been many ways devised for supplying cattle with water in stable, but most of them have a separate trough for each animal, which must each be cleaned separately. It is important to simplify and save labor in all ways. By making a trough in the shape of a V the whole length of the stable, and placing it directly in front of the cows under the manger, so that the lid to the trough may form a part of the bottom of the manger, water may run in at one end, and the cows drink as it passes them, any surplus being drawn off at the other end.

This being a straight, smooth trough, it can be swept and cleaned from end to end as fast as a man can walk. It may be made from pine plank, 1¼ inch thick; one side ten inches, and the other 11¼ inches wide, the one nailed upon the edge of the other, the ends being halved together and white lead put in the joints. The ends should be nailed with fourpenny bradclinching nails. The lid should be hung on the floor side with a rubber cloth hinge, which being flexible, is not injured by wet, and will prevent any bits of hay or dirt from going through into the trough. The other side of the lid should have a strip of 1¼ inch hoop-iron nailed on the upper side, and lapping over one-half inch, to prevent food from going into the trough on the side. The trough and lid should be painted inside and out with two coats of raw linseed oil and oxide of iron before the lid is hung. These lids being sixteen feet long, are thrown open on a long trough in a minute. The side of the manger next the feeding floor should consist of a plank 10 inches wide, set on edge. This makes, when the lid is shut, a plain, straight manger, easily cleaned. To prevent the cows from hooking each other, or reaching after each other's feed, fasten a plank a foot wide in the center between them, reaching into the manger, and cut a half-circle from the lower end, so that the lid will open.

The water to be used in stable may be brought in pipes, and drawn by a cock into the trough, the fountain being an elevated spring, or a reservoir, the bottom of which is higher than the trough; or, it may be pumped.

There is practically, not much difficulty in supplying the water in stable. We use a reservoir of 15,000 gallons, only fifty feet off, brought by a pipe and drawn by a cock. This reservoir is filled, partly by a pipe from a dam 300 feet away supplied by surface water, and partly from the roof.

LUNG DISEASES IN FARM STOCK.

PROF. LAW in his new and admirable work "The Farmer's Veterinary Adviser" in speaking of lung fever and other diseases in farm stock, says:

"The disease ought to be rooted out by measures executed by the General Government and defrayed out of the public treasury. Little good must be looked for from isolated action by States, counties, townships, or individual owners; the danger threatens the entire country, and for the general safety all must pay. It is absurd to expect the unfortunate possessor of sick animals to beggar himself for the public good. There should be destruction of the sick, partial remuneration of the owners, thorough disinfection under professional supervision, and the most perfect control and constant inspection of all suspected herds and places until the malady has been eradicated from the land. This is the most insidious of all other animal plagues, the one which now most urgently presses for active interference, and which, if neglected, will bring a terrible retribution in the future." Free trade in cattle between Britain and the continent, by conveying contagious diseases to the former country, has occasioned a loss to the British people of $450,000,000 in 30 years; so it will be seen that Prof. Law's recommendations are amply borne out by facts.

Our present regulations in regard to glanders and farcy are very unsatisfactory, as in many States there is no law to prevent the conveying and selling of glandered horses. This condition of things brings about very bad results, as within our own experience the purchase of a glandered horse by a company running a large number of horses introduced glanders into their stable, and the extension of the disease was not checked until after thirty sound and valuable horses became infected; and the company considered itself fortunate in not sustaining still heavier loss. If Prof. Law's recommendations in regard to the prevention of glanders lead to better legislation in the premises, the annual losses from this cause will be greatly reduced. Though we have dwelt chiefly on that chapter of the "Veterinary Advisor" which treats of contagious diseases, on account of the great public interest which attaches to many of them, the succeeding chapters are not less interesting to keepers of live stock, as due attention is bestowed upon all the minor maladies to which horses, cattle, sheep and swine are subjected. The author's extensive knowledge of veterinary literature and his varied practical experience have been happily utilized by describing diseases concisely and in language intelligible to all.

The Centennial.

LIVE STOCK ENTRIES AT THE CENTENNIAL EXHIBITION.

THE following entries have been made up to the date of going to press:

PENNSYLVANIA.—Sheep, D. L. Archer, Burgettstown; Swine, E. A. Ashbridge, Wellestown; Horses, F. L. Birchard, Birchardville; Jas. B. Baker, Jr., Thorndale; Sheep, C. H. Beall, Independence; Cattle, J. H. Bronson, Guthrieville; Ayrshires, Sheep and Swine, T. S. Cooper, Coopersburg; Jerseys, Geo. Callaghan, Angora; Horses, Colin Cameron, Marietta; Steers, Job Darlington, Chester; Horses, Mark Devine, W. A. Greenwood, Philadelphia; Sheep, J. C. Gist, Independence; W. A. Herriot, Oakdale Station; Horses, Lewis Harringer, A. Jenks, Philadelphia; Fat Oxen, W. S. Keefer, Chambers; Horses, W. S. Kennedy, Lancaster; Devons, J. B. Longnecker, Union Deposit; Jerseys, Chas. Lafferty, Philadelphia; Swine, A. W. Leigh, Branchtown; Pony, Wm. Mickle, Indiana; Heifers, Miller & Son, Spring City; Guernseys, E. Michener, Carversville; Jerseys, Wm. Massey, Philadelphia; Horse and Short-Horns, Thos. McKean, Easton; Horse, McKean & Hullick, Easton; Jerseys, Hugh McIlvain, Philadelphia; Horse, James Nichols, Honesdale; J. S. Parker, West Chester; Goats and Sheep, Robert Perrine, Patterson's Mills; Sheep, Perrine & Cunningham, Patterson's Mills; Jerseys, John Patterson, Glenmore; Horse, J. G. Pfantz, Lancaster; Jerseys, Eastburn Reeder, New Hope; Swine, J. C. Roberts, West Chester; Steers, Jacob Rupp, Parmersville; Horse, J. S. Stewart, West Chester; Jerseys, Chas. L. Sharpless, Philadelphia; Steers, J. Schamberg & Co., Philadelphia; Swine, J. Shaner, West Chester; Horse, R. C Schenck, Philadelphia: Devons and Jerseys, Sam'l L. Sharpless, Philadelphia; Ayrshires, Thomas Tasker, Philadelphia; Horse, J. H. Taylor, Philadelphia; Horse, S. Van Fleet, Watsontown; Jersey, Chas. Whilling, Philadelphia; Swine, Francis Worth, Philadelphia; Bull, J. C. White, Swatara; Sheep and Swine, Ewd. Waters, Kennett Square; Sheep, Thos. E. Wade, Rocksboro; Horse, H. M. Yeargeo, Alburtis; Horse, Isaac Yost, Lancaster; Horse, Gov. Hartranft, Harrisburg.

NEW YORK.—Ayrshires, Samuel Bradley, Adamsville; Jerseys, G. S. Camp, Oswego; Horses, Thomas Coleman, Sheldrade; Sheep, William Chamberlain, Redhook; Horses and Jerseys, William Crozier, Northport; Devons, Walter Cole, Batavia; Herefords, Clarkson Bros., Potsdam; Horse, D. W. Edwards, Seneca Falls; Devons, James Hilton, New Scotland; Short-Horns, Thomas L. Harison, Morley; Jerseys, Thomas J. Hand, Sing Sing; Fat Ox, John Hadstead, Carlton; Sheep, J. O. Joslin, Tiashoke; Horses, A. R. Murdock, Auburn; Ayreshires, James Miller, Penn Yan; Guernseys, C. H. Matteson, Hudson; Devons, B. F. Peck, East Bethany; Sheep, H. H. Parker, Otego; Horse, S. Parsons, Orange; Jerseys and Sheep, W. L. & W. Rutherford, Waddington; Ray Bros., Holeage; Bull, Smith Spencer, Kiantone; Horse, W. E. Smallman, Malone; Short-Horns, J. R. Stuyvesant, Poughkeepsie; Sheep, E. Townsend, Pavilion Center; Cattle, G. F. Taber, Patterson; Dutch Cattle, Unadilla Co., West Edmiston; Swine and Jerseys, Waterbury & Freeman, West Chester; Short-Horns, C. F. Wadsworth, Genoseo; Bull, Ira Young, Jamestown.

CONNECTICUT.—Horse, Robins Buttoll, Norfolk; Jerseys, Samuel Colt, Hartford; Oxen, J. C. & G. F. Capen, Bloomfield; Ayrshires, John Diamon, Diamon Stock Farm; Jerseys, Thomas Fitch, New London; Oxen, Augustus Hamilton, Watertown; Sheep, G. C. Hitchcock, New Preston; Devons, O. B. King, Watertown; Jerseys, Horatio J. Lathrop, Suffield; Horses, W. J. Osborne, Ausonia; W. B. Smith, Hartford; Jerseys and Alderney Cattle, J. R. Starr, Litchfield; Ayrshires, S. M. & D. Wells, Wethersfield; Jerseys, Jas. B. Williams, Glastonbury.

MARYLAND.—Sheep, A. P. G. Cumming, Mt. Washington; S. R. Crosbie, Cantonvillo; Oxen, H. H. Dnyskinack, Brick Meeting House; Sheep, W. H. Decourcy, Queenstown; Horses, Baldwin Kufty, Princess Ann; W. H. Jenefer, Baltimore; F. Morris, Oakland Mills; Herefords, John Merryman, Hayfield; Horses, James H. Powers, Hamilton; Benj. W. Woods, Germanstown.

NEW JERSEY.—Jerseys, Silas Betts, Bloomfield; Swine, W. H. Cole, Clinton; Jack, L. Lieman, Jersey City; Cattle, Chas. S. Taylor, Burlington; W. S. Taylor, Burlington; Bull, H. Van Bureu, Shrewsbury; Ox, Geo. Wilder, New Egypt; Horses, F. G. Walbert, Jersey City; Whitmack & Hall, Somerville; C. P. Williams Summit.

WISCONSIN.—Sheep, P. Craig, Caldwell's Prairie; O. M. Cook, Waukesha; Chas. Clark, Whitewater; L. Jale, Waukesha; Humlert Bros., Caldwell's Prairie; Geo. Laurence, Waukesha; Horse, Geo. Murray, Racine; Sheep, John H. Paul, Waukesha; E. A. Perkins, Mukuanago Co; Bull, J. P. Switzer, Madison.

OHIO.—Horse, M. H. Cryer, Salem; E. B. Hoge, Flushing; Swine, E. & J. McKleever, Bloomsburg; L. E. Paroth, Washington; S. H. Todd, Wakeman.

ILLINOIS.—Herefords, H. Burleigh, Fairfield; William Constable, Will Co.; Swine, H. C. Castle, Wilmington; Herefords, E. L. Miller, Beechor; Sheep, J. L. Newman, West Jersey; Herefords, William Powell, Beecher; Horses, Jas. R. Perry, Wilmington; Horses, Bruno Gansel, Hyde Park; Swine, J. G. Longshore, Wilmington.

VERMONT.—Sheep, H. C. Bindwell, Bridport; Horse, A. O. Cummings, Montpelier; Sheep, L. P. Clark, Vergennes; A. E. Tuller, Pomfert; R. G. Hill, Elmore; Jerseys, Peter Leclair, Winooski; Sheep, A. E. Perkins, Pomfert.

KENTUCKY.—Horse, W. L. Dills, Cynthiana; Short-Horn, B. B. Groom & Son, Winchester; Horse, R. Penniston, Lexington.

MASSACHUSETTS.—Jerseys, T. Allen; Horses, L. A. Hitchcock, Boston; Ayrshires and Swine, Herbt. Merriam.

MISSOURI.—Sheep, Sam. Archer, Kansas City; Steer, Michael Leo, New Floronee.

VIRGINIA.—Short-Horns, Sam'l. Frank, Bucksmills; Horse, L. Terrell, Hewlet.

KANSAS.—Short-Horns, Geo. Grant, Victoria.

RHODE ISLAND.—Jerseys, J. C. Brown, East Greenwich.

MICHIGAN.—Devons, R. G. Hart, Lapiere.

GEORGIA.—Goats, R. Peters, Jr., Calhoun.

SOUTH CAROLINA. — Horses, Wm. Gurney, Charlestown.

CANADA.—Horses, 40 exhibitors; Cattle, 50 do.; Sheep, 50 do.; Swine, 40 do.

CENTURY BLOSSOMS.

ISAAC NEWTON and Isaac Watts are two Centennial Judges.

A MACHINE in Machinery Hall makes a barrel without the aid of hands.

VENEZUELA exhibits specimens of the sap of the celebrated "cow-tree."

A LARGE mosaic from the ruins of Carthage is on view in the Tunis Department.

MARYLAND illustrates the manner in which oysters are caught in the Chesapeake.

JOSEPH NEWMAN has arrived from San Francisco with a group of 6,000 live silkworms.

THE night signals now in use in the United States Navy were invented by a woman, and can be seen at the Woman's Pavilion.

UNDER Agricultural Hall is a large and full wine cellar, 300 feet long, having a department for each wine-producing country.

SPECIMENS of wooden nutmegs and of wooden hams made from the Charter Oak are exhibited in the Connecticut reception room.

IN the Chinese Court there is a bedstead valued at $4,800. The carving upon it required the labor of twenty Celestials for five years.

A SAGE palm, the specimen of which once belonged to Robert Morris before the Revolution, attracts much attention, and was contributed by Jacob Hoffner of Cincinnati.

THERE is to be a grand "La Crosse" tournament in Philadelphia between a club of 12 picked players from the Iroquois Indians and an equal number of Canadian gentlemen.

THE original coat-of-arms which hung in the Connecticut Assembly over the Speaker's desk at the time of the Declaration of Independence is placed in the Connecticut building.

THE system of teaching the blind is fully exemplified in the Pennsylvania educational building, and numerous specimens of handiwork from different institutions are also exhibited.

THERE is a canoe of ash, from the Indians of Vancouver's Island. It is 60 feet in length and 8 in breadth, with not a chinck nor joint discernible. It is dug out with stones and gouges.

THE prompt delivery of luggage cannot always be effected, and ladies visiting the Centennial should carry with them in a hand-bag such toilet and other articles as are required for immediate use.

PORTUGAL makes an interesting exhibit in Agricultural Hall of the products of her African and East Indian colonies. It includes grains, spices, palm nuts and oil, coffee, sugars, gums, and a variety of native implements.

A LARGE refrigerator is now shown in the Government Building, containing strawberries, fresh salmon, and other perishable articles, embedded in cakes of ice, that can be seen through glass, remaining unchanged day after day.

THE stem of the great Santa Barbara grape vine attracts the attention of many visitors. It is about eighteen inches in diameter at the largest point, and nearly as large elsewhere, a portion of the roots and branches being left on the vine.

THE State Board of Charities of New York has on exhibition in the parlors of the New York State building four portfolios containing photographic plans and views of all the various buildings devoted to public charities in different parts of the State.

A CURIOUS reaper from South Australia is shown in Agricultural Hall. There are no knives about it, the heads of grain being knocked off after passing between long fingers by bars upon a revolving cylinder and deposited in a great bin.

ONE of the most curious articles in the women's department is a whistle made from a pig's tail. Over this strange exhibit are inscribed the following lines:

"There's a proverb as ancient as Scotland's thistle;
That out of a pig's tail you can't make a whistle;
We believe we've accomplished the wonderful thing,
And all who may wish can make this tail sing."

It is presumed that this whistle was made by a lady.

THE Philadelphians plume themselves upon the exceeding elegance and beauty of the surgical instruments manufactured in that city and now on exhibition—the lovely forceps and the charming splint which is spoken of as "a boon of comfort" to many a sufferer, to say nothing of the hip-joint apparatus and the vest for broken ribs. This must be a very pleasing part of the show.

A MODEL in metal of Independence Hall has been placed under a glass covering in Memorial Hall. Scale, three-eighths of an inch to the foot; weight, 1,200 pounds. It is an exact reproduction both of the interior and exterior of the Hall. Outside it is of German silver, oxidized with red gold. Inside are miniature copies of the 160 portraits in the Hall, with models of the furniture, desks, &c.

THE New York State Agricultufal Works, Wheeler & Melick Co. Albany N. Y. Proprietors, have sold to the Japanese Government the *entire* lot of machines exhibited by them at the Centennial Exhibition, consisting of Railway and Lever Horse Powers, Threshers and Cleaners, Threshers and Shakers, Feed Mills, Cider Mills and Presses, Dog and Pony Powers, Horse Rakes, Horse Pitchforks, &c., &c.

THE resignation of Messrs. WING and THORNE of New York, as members of the Advisory Board of the Centennial Live Stock Exhibition, is an occurrence to be deeply regretted by all exhibitors. The reasons however, which impelled this step are still more to be deprecated. The gentlemen speak for themselves. "We were informed that our nominees for judges would be appointed by the Commission. We carefully selected representative men, breeders of repute, who were experts and non-exhibitors, to judge the different classes—three for each class or breed—except in some of the minor ones, where two or three classes were combined. This list was sent in to the Commission for their confirmation. The only response was the appointment by the Commission of judges chosen by themselves, entirely ignoring our classification and appointments—in meantime having made no communication with us whatever. With these facts before us, it is evident our assistance is not required farther by the Centennial Commission. And as we decline to have our names associated with such gross mismanagement, we hereby resign all connection with the Advisory Board of Agriculture of the Centennial Commission."

A MODEL OF THE EXCAVATIONS AT HELL GATE. The southeastern corner of the Government Building contains a model of the excavations now being made in the reef at Hallett's Point, Hell Gate, New York. The model represents a portion of Long Island at that place, with houses, trees, etc., and near the point are the machine shops, engines and engine houses erected for the purpose of keeping tools in repair and compressing air and the motor of the drilling machines. In front is the coffer dam, constructed to keep back the water during the work, and inside of this protection can be seen the shaft which was sunk into the rock below. Beyond the dam is a perfect topographical representation of the reef which has proved so disastrous to navigation, and if water from the East River only could be made to flow above this the counterpart would be perfect. By an automatic contrivance the upper portion of this rock can be raised so as to show its catacomb excavations, and gazing beneath this the visitor can at a glance obtain a clear conception of the magnitude of the work. The roof is something less than one inch in thickness, and represents by its scale ten feet, which is the thickness of the rock above the excavations. Between the roof and the base are a large number of columns or pillars left in the excavations which were made by tunnelling in radiating lines from the shaft, and interseeting those with smaller tunnels. These supporting pillars are so slender that with the roof, three acres in area, there will be 30,000 cubic yards of debris to take up after they are broken by explosions, for over 50,000 cubic yards were taken out in working the excavations. All this part of the work is now complete after an average of four years of labor, and 7000 holes have been drilled in the pillars and roof, so that little remains to be done except to lay the wires and prepare the explosives for the grand finale, which will take place early in October. The explosive to be used will consist of one, or perhaps several, of the preparations of nitro-glycerine, which will be simultaneously ignited by electricity; but even with 7000 charges of the most destructive compounds known to science the force of the detonation will be much less than is generally apprehended. It is well known that a vast collection of individual explosions have less effect at a distance than one-fourth the same power concentrated at one place, and in addition to this fact the excavation will first be flooded with water, which will serve the double purpose of tempering the holes and deadening the concussion. When the roof and pillars are broken the debris can soon be removed, and then there will be at this point twenty-six feet of water at low tide, and thirty-one feet at high tide. As the Sandy Hook Channel has only a depth of twenty-seven feet at high water, and as several hours' time can be saved by entering at Mountain Point and passing through Long Island Sound, the new channel will probably become the favorite course for European vessels.—*Philadelphia Press.*

The Horseman.

CANADIAN HORSES IN ENGLAND.

A CORRESPONDENT of a London journal writes that a number of Canadian horses, purchased in the neighborhood of Toronto and Montreal, have been brought over to England with perfect safety and with a very profitable and encouraging result, and says:

"I went down to Worcester Park, a charming suburban village in Surrey, a few miles from London, where the stables are situated in which the horses are located. The animals were all in what I call capital condition, a little 'above themselves' perhaps, but not so fat as horses are generally made in England by the dealers before sale. The importation was a private speculation, and the importer intends to sail for Canada in about three weeks to purchase another lot. Almost all of the first lot have found purchasers very readily here, although the market for horses is falling a good deal from the prices of the last three or four years.

"The animals were suitable to all purposes, and were all warranted sound and quiet to ride or drive. The average cost price in Canada was $120, and the selling average here has been £55, or $275. The price there is hardly a criterion of what a horse would fetch here, but of this lot only a dozen remained unsold when I visited Worcester Park, though many of the sold lots still remained at the stables. One fine, upstanding bay horse that was bought near Toronto for $102 was sold to a gentleman for a brougham horse for £63. He was, in horse dealers' slang, the 'pick of the basket,' and made the top price. He looked very like taking to the timber business, if properly schooled for a hunter. All the sales were made to private buyers.

"The horses were shipped from New York, owing to the boat from Montreal breaking down. They came in the Wyoming of the Guion Line, without a scratch, in a patent apparatus which economizes room on shipboard and secures safety to the animals. The cost was $50 a head from Montreal to London, including every expense.

"It is the opinion of many judges who have seen this lot of horses that Canadian-bred animals are better suited to the English market than those of Kentucky. As they are the first lot of American horses ever landed in London, they have been visited by many persons interested. The Glasgow tramway cars have been partly horsed by American-bred cattle, but none of these horses are yet employed by the General Omnibus Company, who are ready to buy to any extent if the right sort is offered to them at the right price. The Company have for three or four years been paying about £35 per head for horses of a rough and useful wear-and-tear stamp.

"Such was the interest felt in this consignment that the Agricultural Hall management expressed a desire to have them on view at their establishment. Owing to the Horse Show, however, this was impracticable till most of the lots had found purchasers. It is very likely, however, that the next arrivals will be shown there."

SUNFLOWER SEED FOR FOUNDER.—Sunflower seed are recommended for foundered horses. It is said that a pint of whole seed mixed with the food as soon as it is discovered that a horse is foundered will effect an almost immediate cure. The seed will do no harm even if they should not do the animal any good. Hence the remedy is worth trying.

The Garden.

WHIFFS FROM CANADA—CURRANT PICKING.

It is the first week of August and the black currants are ready to pick. One field contains three acres, in the fourth year of full bearing, and is chiefly cultivated by plow and harrow and the wheeled grubber, the bushes being eight feet apart each way. So this bright Monday morning we begin the picking, each person taking a row. Afar off is the shining river, the quiet farm houses, and I sit in the maple avenue and enjoy the pleasant air while superintending the work and emptying the baskets as brought in.

The children, who always help at this work, are making great haste at the start, but now and then I am obliged to show JAMIE and STANTON that they must not grab the berries in an indiscriminate manner, but lift one branch at a time, and pick the currants carefully by the stem with thumb and finger. Have no trouble in procuring help for this business, and pay girls who assist us fifty cents a day without board. The French Canadians, as a class, prefer out-door work when young, and are expert with a hoe or at weeding a garden; but picking currants is so nearly allied to their favorite wild raspberry gathering that they are quite anxious to be hired. A steady girl can pick about a bushel and a half per day, and we prefer to pay them in this way instead of by the gallon, as we, having picked a day ourselves on trial, know what can be done, and it saves haste or carelessness and skimming over the bushes, as might be done otherwise.

The morning air is sweet, and every breath is fragrant with the perfume of the garden flowers that is wafted here and there through the maples, and mingles with the scent of new-mown hay, the strong sweetness of the heliotrope and the tender mignionette.

Methinks in the trees the birds are holding solemn conclave, and judge us to be a host of giant invaders bent on plunder as they flit to and fro in their anxiety, for have they not till now held undisputed possession of the field? and we owe them our sincere thanks for the way in which they have kept our bushes from the caterpillars, and if after a meal of moths they did make a little dessert of currants, let us not complain. No stronger proof is needed of their value in horticulture than the fact that in gardens where the birds are protected there is no need of hellebore; while in exposed situations, two waterings does not save the bushes.

As soon as the fruit is gathered, the work of cleaning the ground will begin, and when thoroughly done, each bush is dosed with a shovelful of hard wood ashes, procured for this purpose from a steamboat running in the vicinity. This is brought home in the winter season, when labor is cheap, and stored from damp in an enclosed shed. We value this manure highly as tending to keep down weeds, being rich in the needed food for the plants and keeping out insects that have a tendency to burrow at the roots of the bushes. ANNIE L. JACK.

IMPROVED WEEDING HOE.

H. M. ENGLE sends us his "Improved Weeding Hoe," with the request that we shall give it a thorough trial, and report.

Compliance with this request was found to be a pleasant task, since it is the most efficient weeding implement that we have ever used. The shape of the hoe is that of an isosceles triangle with a nitch in the acute angle. This triangular blade is joined by its center to the neck of the handle, diverging somewhat from a right angle, so that the edges are adapted to different work. If we would up-root weeds—cut them off—level uneven places, or merely smooth a path without breaking the surface, a turn of the handle gives the edge best suited to the work. This oblique blade also enables the operator to rest himself while continuing to hoe, since, according to the edge used, he may bend over, as with the ordinary hoe, or stand perfectly erect. They are manufactured in all sizes from the ladies' garden hoe to that best adapted for field work.

CHOICE CABBAGE SEED.

DEAR SIR: I send you for examination by this mail a sample of cabbage seed, grown by my brother on Puget Sound, Wash. Ter. The soil and climate there seem to be adapted to the growth of cabbage and cabbage seed to their greatest perfection. As far as tried in the Eastern States, plants from these seeds have invariably kept far ahead of those from seeds grown here, and have produced beautiful cabbage. In order to have it further tried in all sections, we will send a sample package free to any cabbage grower who will give it a fair trial, upon receipt of his address plainly written on back of a postal card. The variety sent is *Follier's Early Drumhead*, which we have bred up to a point of excellence that we believe to be surpassed by no cabbage in the world. J. F. TILLINGHAST.

La Plume, Luzerne Co., Pa.

GARDEN NOTES.

We know of tomato-plants that were manured with hen manure nearly five feet high at this time (Aug. 15). They are supported by hoops nailed to perpendicular stakes. Others, manured with horse manure, growing beside them are two and a half feet high. The latter, however, are bearing twice as many tomatoes as the former, and they are fully as large.

The Poultry Yard.

FOWLS FOR FARMERS.

THE principal object in keeping fowls, like most other stock, is profit, and the question for a farmer to decide is, "Which is the most profitable for me to keep?" Some farmers have a decided prejudice against all pure-bred stock, but it does not occur to them that all the improvements in their cattle, horses, pigs and poultry, compared with what they were fifty years ago, are all due to the patience of those who have worked to bring them to a higher state of perfection. In regard to keeping fowls in large quantities on farms, I have known farmers to start out with a prejudice against improved breeds and undertake to keep a large stock, thinking that they would do better with the old small, bony, hungry, sparsely-feathered dunghill fowl than they could do by obtaining a stock of an improved strain.

I do not advise farmers to keep entirely pure-bred birds, for there are none that are highly bred but what are a little weaker than a cross in some point, either in laying, feathering, constitution, or rapid development; in other words, all the perfections are not to be found in one breed. For instance, two varieties that are long in maturing, when crossed, will produce chickens that will feather and outgrow either of the parent stock at a given age and make early broilers. I do not mean to say that they can be made to weigh as heavy as the Brahmas with time and care, but Brahma crossed with Dorking, and some others, will make a broiler before either a pure-bred fowl or a common dunghill, showing that the farmer is equally interested with the fancier in having pure blood to cross with.

In the Eastern or Northern States we must have fowls that can endure the cold winters and *lay*. The Brahmas would, perhaps, be the breed if they did not keep one eye on the corn crib and on the gate to see who is coming to feed them, all summer as well as winter, for, as Josh Billings says of ducks, "they always have a little appetite left;" but they also have merits of the greatest value, such as size, winter laying, hardiness, and being good mothers. The latter quality is a little too good in their setting propensities and could well be improved upon.

Now, if a farmer desires to make eggs a specialty, he wants to retain those merits and add to them by inter-breeding with great egg producers, such as Leghorns and Hamburgs. I know several farmers who have crossed the light Brahmas with white Leghorns with excellent results, the fowl thus produced laying very well all through the winter, and when they want to thin out their stock they have good-sized fowls for market. Leghorns being non-sitters, the cross thus produced will sit and rear their own broods. About one-quarter Brahma blood, to harden and infuse sitting qualities into the flock, is enough.

After the first cross, which would be half of each sort, and is best produced with Brahma cocks and Leghorn hens, next year breed this cross with Leghorn cocks and you will have them about right. As some chickens will revert back to the original types, experience will teach the breeder which ones to remove first when he thins out. The Leghorn is the hardiest great layer. Their eggs are also large, and are thus beginning to be known in New York markets, being quoted as Leghorn eggs. No doubt the size has led to this. Much is expected of the Brown Leghorn. It has not yet, however, stood the test of time that the White has, but is a great favorite, and I know parties who will test their comparative merits on a large scale this fall. There are other good crosses, such, for instance, as Houdans with Leghorns, and Hamburgs with Brahmas. Leghorns, after their first cross, are very good. Dorkings with either Leghorns or Hamburgs are good for farm purposes, but the first-named are the strongest and more able to resist the cold weather of winter. The latter is a most excellent breed for California or any mild, high country.

If you desire to raise chickens for killing, I would advise a cross between Brahma hens and Gray or Colored Dorking cocks, they maturing the quickest of any, as I have found by experience. I have had large pullets laying in September when less than five months old. I have found that if kept to a first cross they grow better than to breed back to either side.

Houdans and Brahmas are said to produce quick-growing chicks, and I have no doubt they are a good selection, as either cross will much improve, not only the growth, but also the flavor and delicacy of the flesh. HENRY HALES.

QUERY ABOUT PLYMOUTH ROCKS.

A NEIGHBOR of mine has some Plymouth Rock fowls, for which he paid a good price. Last spring he was quite successful in raising chickens, and he is very proud of them. I have some light Brahmas, having no pretensions to purity, mixed up with Dominiques and common fowls. Some of the chickens raised from this mixture are so similar in appearance to my neighbor's fancy Plymouth Rocks that I cannot distinguish any dissimilarity. Are not mine as good as his? What is the difference? Please tell me.—W. HAYES, *Staten Island, N. Y.*

Plymouth Rocks may resemble your fowls pretty closely, for this breed is without doubt a cross between the Brahmas and Dominiques. The shape of the body is characteristic of the first, and the color and single comb are from the latter, but by examining your stock closely you will see there is not the uniformity in the chickens that there is in those of your neighbor. See if the legs of all your stock are free from feathers and of a pure yellow color, their combs upright and the featherings evenly barred. Your chickens, when bred from again, will revert back to Brahmas and Dominiques, while those of your neighbor will breed true. The reason of this is because they have been selected time after time until the principal characteristics, as you now see them, have become fixed. This is the way that most of our distinct breeds of fowls have been produced. H. H.

Scientific and Useful.

A PRACTICAL TEST FOR VINEGAR.

HOUSEKEEPERS in cities often find it very difficult to obtain good vinegar, besides an article which may appear to be pure to the palate, will not stand a chemical test in this respect. The American Grocer gives a few hints on detecting adulterated vinegar, which may be of use to some of our readers:

We have frequently been asked for some simple and practical method of testing the purity and strength of vinegar. Of course, to ascertain just what and how much adulteration is in vinegar, a chemical analysis is necessary, but for obvious reasons this is not obtainable by retailers generally. The most common adulterant, however, is acid, which is added to increase the strength, and to detect this the pickle manufacturers have a simple test that is infallible, and shows the slightest trace of that article. Each pickle manufacturer keeps a small vial of the solution of muriate of barytes, obtainable for a few cents at any drug store. When a sample of vinegar is offered he turns out a wine glass about half full and adds about ten or twelve drops of the muriate of barytes. If the vinegar is pure it will show no change. If it contains acids it will gradually turn to a milky hue, according to the quantity of acids in it.

To show the nicety of the test we give an instance that lately happened:—A farmer brought in a sample of cider vinegar which, as he had made it himself, he knew was absolutely pure. On testing it, it showed a faint milky cloud, indicating that there was acid of some kind in it. Not being able to explain it, he went home and tested each barrel and found it all so. After patient investigation he finally found that he had used water from a cistern supplied from a roof having copper gutters to carry off the water. We also tested, this week, a sample of imported bottle white wine vinegar, bearing a name known all over the world, and this also showed a slight trace of acids, added probably to increase the strength.

To test the strength of vinegar, the simplest way is to find how many grains of bi-carbonate of soda a troy ounce of vinegar will neutralize or dissolve. As retailers do not have scales sufficiently delicate to weigh out small quantities the best way is to take a sample of vinegar to a druggist and have him weigh out one ounce. Then if the vinegar is said to be 30 grains strength, weigh out 30 grains of bi-carbonate of soda, and if the ounce of vinegar will neutralize the whole of it and take no more, it is 30 grains of strength. The strength of vinegar, therefore, is determined by the number of grains of bi-carbonate of soda a troy ounce will completely neutralize.

LEATHER IN ONE HOUR.

IN the good old time when a pair of boots were expected to last the wearer a year or two, it required almost that time to tan the leather. But quick tanned, quick worn out, has become the rule, but we are likely to do away with all the slow processes both in producing and consuming judging from what we read of a new discovery in tanning as reported in the Commercial Bulletin:

Wonderful are the changes that have been effected of late years in the manufacture of leather by the use of chemicals and machinery, in place of the old-fashioned tan-pits and the slow manipulation of the currier and tanner. If some of our old leather manufacturers could be resurrected,—men who were accustomed to soaking their hides for years and turning them assiduously at certain seasons,—how they would stare to see the present process! But every day we hear of something new in this direction. A joint stock company was recently formed in Detroit for the purpose of tanning leather in one hour! We give the information for what it is worth; but it certainly does look like sleight-of-hand. The process is a chemical one, performed by the action of certain inexpensive materials, the compounding of which in the right proportion is a secret. It is claimed that robes, tanned with the hair on, are soft as the finest wool; hides of the deer, horse, dog, etc., are smooth and soft, while calf and kip show the texture and grain which good shoemakers most admire. No bark is required except a little to give the proper color to the leather. Bark is worth $8 to $9 a cord, and about 200 cords are required to tan 1,000 hides by the common method. Two cords would be sufficient to give the proper color to the same number of hides, and the saving in this item will be enormous. We understand that the company are turning out from 2,000 to 3,000 hides per month. How the article is wearing we have not been able to ascertain, but shall watch the result with interest.

SCIENTIFIC AND USEFUL NOTES.

The mucilage used by the Government for postage stamps is composed of:—Dextrin, 2 oz.; acetic acid, 1 oz.; water, 5 oz.; alcohol, 1 oz.

Alum and Plaster of Paris, well mixed in water and used in the liquid state, form a hard composition and is a good cement.

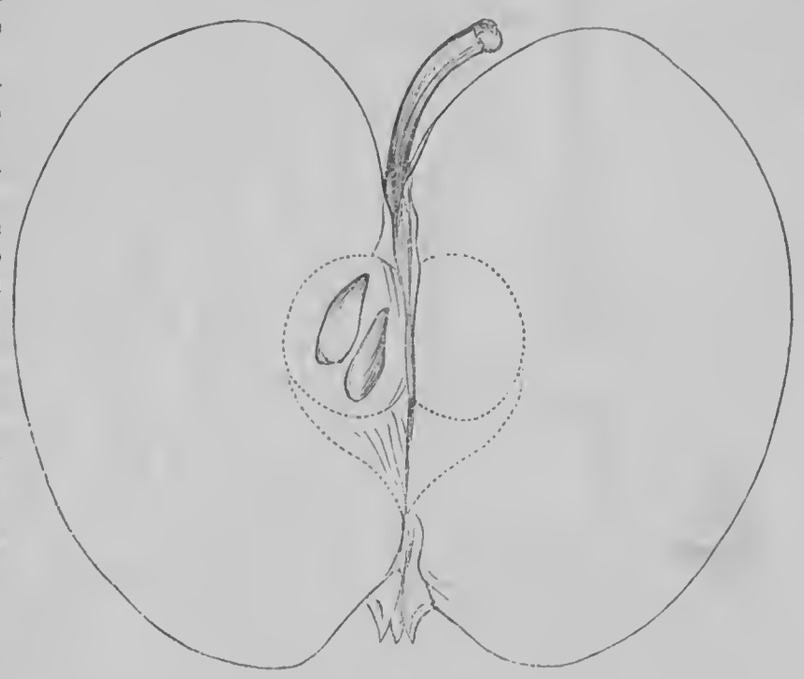
Pomological.

RAMBOUR PAPELEU APPLE.

This is one of the very good apples which have originated in Russia. Most of the varieties from this source have proved to be hardy and valuable for the more Northern States, and the *Rambour Papleu* promises to be no exception to this rule.



The tree is very vigorous and productive. Fruit large, roundish oblate, conical, deep rich yellow, spotted striped and splashed with shades of rich red and small russet dots. Flesh yellowish-white, rather coarse, breaking, sharp subacid; excellent. Season, November to January. The accompanying outline is from an average specimen when well grown. This variety gave promise a few years since of becoming quite popular and we should be pleased to hear from those who have had experience with it as to their success.

APPLES IN WISCONSIN.

I noticed in a late number of the Rural, an article under the heading, "Apples in Wisconsin." In which the writer conveys the idea that the raising of apples in this State is a failure. Now Mr. Editor, I claim that apples have, and can be raised successfully in Southern Wisconsin. The writer has an orchard of perhaps 75 or 100 thrifty bearing trees, and out of the whole lot not more than 10 have been replanted since it was first set out 15 years ago. In this country nearly every farmer raises his own fruit. I have now in my mind two large orchards of perhaps 600 or 800 trees each, and should you ask their owners to day if apple raising in Wisconsin was a failure, their answer would be no! Does a farmer expect a harvest without sowing grain. Neither can he reasonably expect to raise apples unless he takes good care of his orchard. Orchards need care as well as a horse or cow. A man that will set out an orchard and not prune or cultivate—let the borer get in and take no care of it whatever, ought to fail. I say again that apples can be grown in Wisconsin.

Respectfully Yours, O. D. H.

THE SURPRISE RASPBERRY.

I notice in the Rural New-Yorker of Aug. 5, in speaking of the introduction of a new red Raspberry to which this name has been given, you refer to the fact that the name of "Surprise" had already been used for a Black Cap variety, and give the credit to Samuel Miller as the originator. I think this variety was not a seedling grown by Mr. Miller, but an accidental wild variety discovered in a fence-corner at Hermann, Mo., by Geo. Husmann, who named it "Surprise," on account of the surprise the large size, peculiar shape, productiveness and excellence of the fruit created in his mind when he first saw it. I have often wondered why some of the prominent Raspberry growers have not taken some pains to grow, and *push* this variety, for I believe it would prove valuable, and take a high place as a standard and reliable fruit among Raspberries of its class. I know no other Black Cap having the pointed or conical shape of the "Surprise," nor one which I believe would be more valuable in cultivation. Now I beg that none of your readers will write me for plants of the "Surprise," for I have none for sale; nor do I know that Mr. Husmann has any. I make those remarks however, hoping it may induce Mr. Barry, or some of our large raspberry growers to rescue from undeserved neglect, a fruit that may be found valuable for general cultivation.—Geo. W. Campbell, *Delaware, Ohio.*

We stand corrected on the origin of the "Surprise" *disseminated* by Mr. Samuel Miller, but found by Mr. Geo. Husmann; also join our correspondent in commending it to the attention of the cultivators of this fruit.—[Ed. Rural.

PRONUNCIATION.

Dr. J. A. Warder in his essay read before the Ohio State H. S., says "unfortunately for those who desire to strive toward perfection in this matter of foreign names, our teachers have sometimes sadly misled us, as is illustrated in the word *Beurre*, which so frequently recurs in lists of French pears. It should not be pronounced *Burray* as we have been taught, but *Burr*."]

[How is this? The French word Beurre—the final letter accented—means butter-pear. It is pronounced *Beuray*. The French word Beurre not accented means butter and is pronounced *Beu-r.*]

Floricultural.

PANSIES.

BY AN OLD GARDENER.

A bed of Pansies! Did you ever observe the expression of Pansies' faces? There is not one that is sad, though no two are alike. All are jolly. Some wear a wise look of irony, as if to say: "Behold the depth of my knowledge!" Others wear a labored look of sanctimoniousness, as if they had to bite their lips to refrain from laughing outright. Some wear the look of an owl—serious, comic, wise. They form a miniature encampment of crazy, pantomimic fairies.

"Fairies black, blue, yellow and white;"

of upstart caricaturists, and the conversion of every wise look, that mortals put on, into ridicule, is their specialty and delight. Even the pistil deprived of its leaves resembles a skeleton-bust and head that has laughed itself into a chronic state of scorn—or a scornful state of chronic laughter. Is there another flower that one can look upon and enjoy a smile at its expression?

But it is only those Pansies that present a contrast of colors that seem thus to live for the gratification of their sarcastic mirth. The dark-colored or self Pansies have no faces, and, of course, no sardonic expressions—but they make it up in the almost unequaled richness of their velvety shades.

"King of the Blacks," the type of a hundred dark varieties, is as black as its name indicates I have grown this Pansy so black that a silk hat beside it seemed faded. Some of these have a tiny yellow eye, encircled by a tiny band of deep-blue that blends into the black, forming a flower that should be examined under a glass. I have raised others of the most intense shades of blue—from as nearly black as blue can be, to a shade lighter than the sky. Others have presented the same range in purple. Beds of Pansies of the same color are not uncommon now-a-days. Early in the season was one in the Centennial grounds that attracted some notice. They were Blacks—evidently selected plants—all in full bloom and bearing large flowers, in which, without a close scrutiny, no difference in shade could be detected. The bed was fairly black and green. My own Pansies—or rather those that I still prize most—were raised years ago from seeds, the parents of which received a first prize in an English horticultural exhibition.

We have every season since cultivated them with care, marking and selecting seeds only from the best marked and largest flowers. It is the only way, not only by which Pansies can be improved, but by which they can be made to hold their own in this country.

But no matter how choice our seeds, we need never hope to raise large flowers unless the plants be kept moist and shady. They cannot endure our summer sun—and no amount of preparation of soil—of watering, of mulching will insure large flowers from June till September when thus exposed. Up to the 1st of June and after Sep. 1st till frosts, the plants will thrive in any good soil and produce fair-sized flowers, even if not shaded. But during this period, shade, moisture and richness are positively indispensable, and all who attempt their cultivation regardless of these provisions will surely meet with disappointment.

The north side of a building and as far from it as the shade extends, is the best place to make the bed. Dig at least a spade deep and fill in or mix with old manure, decayed sod or soil from the woods, with a sufficient quantity of sand to prevent it from becoming too compact. Sow seeds in the house in boxes or pots, the latter part of February, an inch apart. (Nothing is gained by sowing seeds now. We have but the unnecessary trouble of protecting them through the winter.) They will germinate in ten days. Prick out and plant in the prepared bed, as soon as spring opens, about ten inches apart. They will scarcely need artificial watering until summer. But then whether the season be moist or dry—it must be given. A constant moisture will secure fair-sized flowers during July and August. And to this rule, a single exception will cause a noticeable diminution in their size. Many of your readers may know how finely the Pansy thrives in the moist climate of England. Even in the way I have directed, we cannot equal their flowers in size, because they grow in a moist air which, during the hottest of our weather, we cannot supply. A shady position—one that receives the sun not after nine in the morning, or before five in the evening—and preserving the soil uniformly moist are the nearest approach we can make. In this way we may, it is true, fail to produce flowers four inches in diameter—a size I have often read about in catalogue harangues, but have never seen, even in the best of Spring conservatory plants; but our own have averaged from 1½ to 2 inches throughout the summer, and with this result, as compared with what I *have* seen, I am well satisfied.

There are many lovers of herbaceous plants who are especially fond of this captivating flower, who have failed in its successful cultivation, because its requirements have not been provided. As you have never given the Pansy a very liberal space, I have made bold to do so, as it is a most particular favorite of mine.

Permit me to say, however, Editors of the Rural, that I have read your paper for nearly sixteen years and that I have never liked it so well as of late months. Its vigor, originality, avoidance of all words that might grate upon delicate feelings, the evident pains with which every department is worked up—entitle it, in my poor estimation, to an ultimate success greater than it has ever achieved. An Old Gardener.

[We thank An Old Gardener, with whom we have not the pleasure of being acquainted, for his agreeable Pansy article, and hope to hear from him again. We have, indeed, neglected the Pansy and hundreds of other fine old plants; but only because others have been deemed of paramount interest.

Let us say that his kind words as regards the R. N. Y. are but one instance of many that we have of late received. Such expressions encourage us to every effort of which we are capable for the future. But our best friends will agree with us that their publication would constitute one of those forms of "demnition" self-praise, the seeming necessity for which in American journalism is greatly to be deplored.

Excuse us then, kind friends, if, when such flattering expressions occur in the body of articles intended for publication, we cut them out for our own private edification.—Eds.]

MISCELLANEA.

Removing Aquatic Plants.—We paid a visit to the banks of the Guadalquiver—no, it was the Hackensack (a name scarcely less liquid and euphonic, is it?) and there procured several roots of *Pontederia*, one of the most charming of water plants; of the Swamp Rose Mallow, the gem of the meadows; of the Cardinal Flower, etc. These were removed with a quantity of muck adhering about the roots and placed in a part of our Wild Garden. This, from its situation upon a sloping bank of one of the loveliest little lakes in the world, we have designated as The Palustер—not to call up needless thoughts of mosquitoes and miasmata, which, upon our conscience, positively are unknown here. They all thrive—(the *plants* are meant of course, not the mosquitoes and miasmata)—and we believe this to be the best way of establishing aquatics in suitable parts of one's grounds.

Balsam Edging.—We have lately seen Balsam planted as an edging. Three hundred plants, more or less, were employed in this way. They were all pure white, very double and of the Camellia sort. These double white Balsam are very useful for floral, table, or hall displays. Saucers, plates, low baskets of any size may be used. Fill with moist sand and press to an oval shape. Little hollows may be made with the fingers in which to insert the base of the flowers. Arrange them so that the petals everywhere touch and so as to conceal the edges of the vessel. The center may consist of more prominent flowers of any color, and the whole relieved by sprays of Smilax, Myrtle or other enduring green leaves. The same sand will serve as long as need be, if washed out occasionally, and it is less trouble to arrange flowers in this way than in the usual boquet form, where the stems are cut long, tied together and immersed in water.

Pelargonium Seed.—It is now a good time to collect the seeds of bedded Pelargoniums. The hot season which has retarded leaf and stem growth, has been favorable to the production of flowers and seeds—though quite unfavorable to the beauty or endurance of the trusses.

The seeds, if sown out-of-doors in little prepared beds (one foot square is large enough for fifty) will, by frost, form little plants that may easily be potted and cultivated in the house through the winter. Thus treated, they will bloom when turned out in the spring as early as old plants.

From such seedlings, symmetry of form and inferiority of flower are alike certain.

NOTES.

James Vick thus cozily expresses himself in his No. 4 of the Floral Guide just received: "Four bushels of Grass to the acre for a quick, good lawn, and anyone who sows Rye or Oats or Turnips with the seed to *protect* it, ought to be sent to the lunatic asylum."

Why have you no Lawn? Too late. The hot, dry weather of June set in before the seed had obtained any root-hold of the earth. If you sow in Spring, do it as soon as the ground can possibly be got ready. A little White Clover it will be well to sow with the grass, and a few ounces of Sweet Vernal Grass will give a Vanilla flavor to an acre. Do I suppose the seed you sowed for grass seed was pretty much all weeds? No, not at all likely. You have a crop of weeds, to be sure, but suppose you had planted Corn or Potatoes instead of sowing grass seed, and had not used the hoe, don't you think you would have had a pretty good crop of weeds? Most of our soils are thickly seeded with seeds of many kinds of weeds.

EXCHANGE.

M. T. Wills, Oregon, Mo.—I am so pleased with your announcement of last spring regarding the exchange of seeds, plants and bulbs that I take this opportunity of availing myself of it.

I have bulbs of *Lilium auratum*, also a native Lily [you should give the name.—Eds.] that I wish to exchange for any other kinds of Lily bulbs the Rural friends may have to exchange, Or I will exchange for other hardy bulbs, such as Tulips, etc., as long as my stock holds out.

Around the Republic.

A LITTLE MORE ABOUT KANSAS.

Editor Rural New-Yorker: Permit me, through your columns, to say a few words in answer to my friend "Philo," who claims to be a neighbor of mine, although I never met him, to my knowledge. He seems to carry the impression that I have failed to tell the whole truth in regard to this country, and have only presented the bright side of the picture. He admits most of what I say in regard to the country—that it is beautiful, rich and fertile, and holds a central position in the Union, all of which are facts that cannot be denied, but opposes me on the average yield of crops which I had not mentioned in my article referred to.

It would seem that my neighbor must have taken his data from a class of farmers that are represented in every country as well as in Kansas, who farm to the halves, and think that all that is required to raise a crop is to work the ground in an indifferent way, and after that leave the crop to take care of itself. My observations have been very close while in this country, and have never known a crop to fail here from any deficiency in the soil or climate when properly gotten in and attended to, and am of the opinion that the average yield of all the cereals here in Kansas is far ahead of most of the other States in the Union, which can be demonstrated by statistics. I am surprised to hear my friend talk as he does, and never heard so low an estimate of the average yield of our crops before, and concluded that he must belong to that class of croakers of which we have many in these parts.

I will agree with him that we got rid of at least one-third of that class at the time of the great "hopper raid," two years ago, who rushed East to get under the protection of their wive's relatives, but were very glad to get back to Kansas again as soon as they were furnished with means to do so. Corn will yield from 50 to 100 bushels per acre, by proper care.

Wheat he admits to average 20 bushels, which he says is fair, yet I have known instances where 50 and even 60 bushels have been taken from an acre. We had numerous instances last season

where 80 bushels of oats had been raised on an acre, and yet "Philo" fails to get but 35.

As for Irish potatoes, we have raised good crops for the last two years, which have yielded as good a quality and about as much per acre as you would get at the East. We have the advantage over the east in that we can raise many vegetables here that cannot be produced there. For instance, the sweet potato grows here luxuriantly, and is raised with as little trouble as the Irish potato can be at the North. I will agree with "Philo" that beans have not proved as successful here as in the East, but conclude the reason is because the soil is too rich and new, and that we shall have to wait for that crop until our land gets "poor enough to raise white beans on."

I must differ from my friend in regard to our being at a great distance from the leading markets of the East and North, but think that we are very highly favored with a good market for our surplus produce. Our wheat crop brought on an average last season $1.15 per bushel, which is a fair price, in view of the fact that this is a natural wheat-growing region and it yielded abundantly here. We have one of the best markets in the world, from the boundless mineral regions of New Mexico, Colorado and Arizona, which, from their great mining resources, will always consume a large percentage of our surplus grains; besides, we are now shipping large quantities of flour to the East, manufactured here from our own wheat. Our coarse grain can be fed here and then sent to market in the shape of cattle and hogs, which will help us out in that respect. I am acquainted with persons who came here five years ago and took homesteads, who had barely enough to pay for the filings on their claims, who can now take $5,000 for their improvements. I have failed to meet with any parties who "remain here from compulsion rather than choice," and think my friend must be mistaken in that respect, from the fact that property has advanced, within the past two years, more than fifty per cent. Real estate is in good demand, and no one wishing to sell can long be deprived of an opportunity to do so. As for farm implements, &c., being sold in excess I have had a very good opportunity of knowing that to be false, as the farmers who have made the purchases are, in every instance, capable of fulfilling on their part without distressing their families, as claimed by my friend, and in this country where machinery can be used so successfully, it will pay to purchase it.

As to wages I shall take issue, as I have a neighbor who, with a three-horse team, broke 70 acres in four weeks, for which he received three dollars per acre. Labor has been in good demand ever since our recovery from the great grasshopper raid of 1874, and there has been no time since then but what men could get fair wages. Our mechanics are all employed, and it is a hard matter to find enough to do the work at this time.

We have three stone and brick business houses in course of erection in our city, with a half-dozen more that will be put up this season. These, with the numerous dwellings that are being built, make business very lively here in Newton. Grain buyers have already commenced operations, and all conspire to put on a lovely and prosperous aspect. B. M. HOUSE.

Domestic Economy.

MYSTERIES OF THE KITCHEN, AGAIN.

MRS. H. F. BELL.—Dear Friend: I felt that you were truly that when you kindly responded to my cry about ginger cookies. I thank you for your confidence about pot-pie, and I believe I can help you, for I love it, too, and moreover, can make it and have it good

I have not stood with my elbows on the table and my feet crossed under it watching my mother perform the mystery of making good pot-pie in vain. We lived on a farm then, and she always used butter and pure cream for the crust; but I buy my few pints a day, therefore have no cream. I generally use baking powder, and make the crust just as you do for soda biscuit. Roll it very thin and cut it in small square pieces. I have the chicken in the kettle cooked tender by this time, with sufficient gravy around it, properly seasoned with butter, pepper and salt, also have boiling water in tea-kettle to add if necessary. I then drop in one piece of dough after another until there is a layer covering the meat. Put on a close lid, and let it boil three minutes, and then put in another layer and let it boil, and so on until all is in. Then let it all boil fifteen minutes and it is done.

My crust is always light and nice. Please try it. I do not believe there will be any left to throw at the chickens when they scratch up your flower beds. If there is, don't use it for that, but fry it in butter for your husband's breakfast the next morning.

Mrs. L. E. N. of the Big Village may try it, too, if she wishes, and see if I am pot-pie, minus gumption. To her let me add a word of caution. My experience proves that things pitched together are seldom good, unless presided over by a *genius*. So be careful. I hope you will not think me ungrateful when I say I did not try your recipe. I do not intend to attempt ginger cookies for mouths to come; but JOHN'S mother did, and sent us a basketful one day for lunch. They were good, and I appreciated her kindness, but this act was only a shadow of all the precious things she does for me. Adieu. I fear the editor would enjoy this subject better in a more visible form. MRS. M. L. S.

DEAR MR. EDITOR: Whew! what a muddle your printer has made of the Domestic Recipes in the RURAL of Aug. 19th. I am as mad as a hornet, (very unladylike, I admit, but nevertheless true,) and Mr. RUSTIC thinks I had better let off some of my indignation at once, else I will not sleep a wink to-night.

I always supposed it was a rule for the printer "to follow copy," which has not been done in this instance, by a long way. Now I want you to distinctly understand that if my "Originals" get so mixed up with "Selected" again, I shall resign my space to a more calm and amiable old lady, for I cannot, and will not, have my nerves so disturbed.—MRS. RUSTIC.

[WE beg our fair correspondent's pardon, and will endeavor, in the future, to make the "Imp," who is supposed to be at the bottom of all mischief, walk straight in the RURAL office, especially when handling copy of Domestic Department.—ED.]

ORIGINAL RECIPES.

Dried Sweet Corn.—As it is now the season for drying sweet corn, I send my process: Pick the corn the night beforehand; husk it in the morning, in order to give it the benefit of the fire while morning's work is being done up. Cut the corn from the cob. It dries quicker not to scrape the cob with the knife afterwards. Put it into pans and set it in the oven, with the doors open, if the fire is brisk. Stir it often until it is thoroughly scalded through, spread it in the sun and these sultry August days soon finish it up. When sufficiently dry, put up in paper bags and hang near the fire some time, as it is apt to gather dampness. Some complete the process by the fire entirely, but it requires more attention. The object in scalding it and hurrying the drying is to prevent the corn souring. In good weather a batch can be finished in twenty-four hours. Many housekeepers do not know the luxury of having dried sweet corn for a winter dish. To cook it, soak over night in cold water, then simmer on the stove until tender, then season like succotash, with cream and butter. The Minnesota sweet corn is the best and earliest variety we have ever tried.—FARMER'S WIFE.

Lemon Pies.—Here is mother's recipe for two lemon pies: Three lemons, four eggs, eighteen tablespoonfuls of loaf sugar, two tablespoonfuls of melted butter; beat together the yolks of the eggs, ten tablespoonfuls of sugar, the juice of the lemon, the grated rind of two lemons, add the butter and a little grated nutmeg. Bake in an under crust until the paste is done. Take from the oven and spread on icing, made from the whites of the eggs and eight tablespoonfuls of sugar. Return to the oven till they are a delicate brown.—C. A. B.

Pot-pie good as Mother's.—Take new milk, two spoons of sweet cream, and yeast enough to raise. I begin at seven o'clock in the morning making them into biscuits, and let them raise. Cut them apart, and not have the kettle crowded; and if any are left, I steam them (some think these the best). Put in a few potatoes to stop the boiling, and cook half an hour. I never have soggy ones. Be sure and mix them hard enough. —FIFTY-FIVE, *Salem, N. Y.*

SELECTED RECIPES.

Handy Chow Chow.—Chop together, very finely, a head of cabbage, six green peppers, six green tomatoes; add two teaspoonfuls of mustard, one tablespoonful of salt, a little cloves and allspice, and vinegar to wet it. It will keep a long time.

Tomato Salad.—Take ripe tomatoes and cut them in thin slices; sprinkle over them a small quantity of finely-chopped green onions; add salt, pepper, vinegar, and oil, if liked. The oil should be in the proportion of three tablespoonfuls to one of vinegar. Serve with any roast meat.

Stuffed Tomatoes.—Get them as large and firm as possible; cut a round place in the top of each and scrape out all the soft parts; mix with stale bread-crumbs, corn, onions, parsley, butter, pepper and salt; chop very fine and fill the tomatoes carefully; bake in a moderately hot oven; put a little butter in the pan, and see that they do not burn or become dry.

Fricasseed Tomatoes.—Place the tomatoes in a stone jar, and put it into a steamer. When they are tender, beat them to a pulp and put them into a stewpan with a little onion (which has been minced and stewed in butter until it is tender), a seasoning of pepper and salt, and some chopped parsley; simmer the mixture for a few minutes, and serve it very hot. It is good either alone or served in the dish with chops, or other meat, sausages, or fish of any kind.

Hygienic Information.

AN IMPORTANT REPORT ON DISINFECTANTS.

THE London Times, in noticing the sixth report of the medical offices of the Privy Council, comments upon an article by Dr. BAXTER and says:

A great number of very careful experiments were made with a view to test the disinfecting properties of the so-called disinfectants commonly used. Evidence was adduced to show that carbolic acid, sulphur, permanganate of potash and chlorine are all endowed with true disinfectant properties, though in very varying degrees. The effectual disinfectant operation of chlorine and permanganate of potash appears to depend far more on the nature of the medium through which the particles of the infective matter are distributed than on the specific character of the particles themselves. A virulent liquid cannot be regarded as certainly and completely disinfected by sulphur unless it has been rendered permanently and thoroughly acid. No virulent liquid can be considered disinfected by carbolic acid unless it contains at least two per centum by weight of the pure acid.

When disinfectants are mixed with a liquid, it is very important to be sure that they are thoroughly incorporated with it, and that no solid matters capable of shielding contagion from immediate contact with its destroyer overlooked. Aerial disaffection, as commonly practiced in the sick-room, is either useless or positively objectionable, owing to the false sense of security it is calculated to produce. To make the air of a room smell strongly of carbolic acid by scattering carbolic powder about the floor, or of chlorine by placing a tray of chloride of lime in a corner, is, so far as the destruction of specific contagia is concerned, an utterly futile proceeding.

The practical result of these experiments goes to prove (1) that dry heat, when it can be applied, is probably the most efficient of all disinfectants; (2) that the old plan of stopping up crevices and fumigating with sulphur and charcoal is more efficacious than any other proceeding with more modern disinfectants; (3) that the use of carbolic vapor for disinfecting purposes should be abandoned, owing to the relative feebleness and uncertainty of its action.

ANOTHER REMEDY FOR RHEUMATISM.

THE Medical Brief reports that Dr. Maclagan has used salicine in rheumatism. He employed it in eight cases, and arrives at the following conclusions:

1. We have in salicine a valuable remedy in the treatment of acute rheumatism.

2. The more acute the case, the more marked the benefit produced.

3. In acute cases, its beneficial action is generally apparent within twenty-four, always within forty-eight hours, of its administration in sufficient dose.

4. Given thus at the commencement of the attack, it seems sometimes to arrest the course of the malady as effectively as quinine cures an ague, or ipecacuanha a dysentery.

5. The relief of pain is always one of the earliest effects produced.

6. In acute cases, relief of pain and a fall of temperature generally occur simultaneously.

7. In subacute cases, the pain is sometimes decidedly relieved before the temperature begins to fall; this is especially the case when, as is frequently observed in those of nervous temperament, the pain is proportionally greater than the abnormal rise of temperature.

8. In chronic rheumatism salicine sometimes does good where other remedies fail; but it also sometimes fails where others do good.

The dose employed was from ten to thirty grains every two, three, or four hours, according to the severity of the case. Fifteen grains every three hours Mr. Pemberton conceives to be a medium dose for an acute case.

HYGIENIC NOTES.

Scrofula.—A tea made of ripe dried whortleberries and drank in place of water is a sure and speedy cure for scrofula difficulties, however bad.

Good for Prickly Heat.—Cream of tartar one ounce, flour of sulphur one ounce; take a teaspoonful three times a day in half a tumbler of cold water. Vegetable diet and cold bathing are desirable.

Remedy for Poison.—If a person swallows any poison whatever, or has fallen into convulsions from having overloaded the stomach, an instantaneous and very efficient remedy is a heaping teaspoonful of common salt, and as much ground mustard, stirred rapidly in a teacup of water, warm or cold, and swallowed instantly. It is scarcely down before it begins to come up, bringing with it the remaining contents of the stomach; and lest there be any remnant of a poison however small, let the white of an egg, and sweet oil, or butter, or lard—several spoonfuls—be swallowed immediately after vomiting; because these very common articles nullify a larger number of virulent poisons than any medicines in the shops.

Farm Economy.

WAGES IN OLDEN TIMES.

THOSE who think the laborers at the present day are poorly paid, may derive some consolation from the following which we copy from Fraser's Magazine:

On April 10, 1504, the Justices assembled at the Chapter House agreed upon a new rate for servants' and laborers' wages, according to the statute of the fifth year of Elizabeth. It may be noticed in passing that "William Strode, High Sheriff," appears in the middle of the list of names of those present, not as having any precedence over the others. In modern times the sheriff, as is well known, takes no part in the business of sessions. The maximum rates of wages were as follows:

No baliff of husbandry, "chiffe hyne" (chief hind), or miller, was to take above 53s. 4d. by the year and his livery, or 13s. 4d. for the same.

No common man servant of husbandry, between the ages of sixteen or twenty, was to take above 30s. by the year, and after the age of twenty above 40s.

No woman servant under the age of fourteen was to take any wages but meat, drink and clothes; from the age of fourteen to eighteen, not above 12s. and livery, and 6s. for the same; and after the age of eighteen, not above 16s. 8d. and livery, or 6s. 8d. for the same.

No woman "laboring at hay" was to take above 2d. a day and meat and drink. In corn harvest, 3d. and 7d. respectively, and all other work 1d. or 5d.

All laborers at task work might take as they could agree.

All husbandry laborers were to take from All-hallowtide (Nov. 1) till Candlemas (Feb. 2) but 3d. a day with meat and drink, or 7d. a day without. From Candlemas till All-hallowtide, 4d. or 8d. respectively, except when mowing corn or grass, for which they might take 6d. or 12d.

Master-masons, carpenters, joiners, plumbers, helliers, plasterers and thatchers, having servants or apprentices according to the statute, and able to take charge of the work, were to take by the day, with meat and drink, not above 6d., or 12d. without.

Other masons, carpenters, etc., were to take not above 5d. or 11d., and apprentices and boys not above 2s. or 6d.

A pair of sawyers were to take not above 12d. or 2s.

The rates of wages were settled yearly at the Easter sessions, and proclaimed by the Sheriff; but they do not seem to have been altered during the rest of the reign of Elizabeth. In October, 1601, we find an order that all constables are to ascertain the names of all masters and servants that give or take more wages than those appointed, and report them to the Justices, and five sub-committees are appointed specially to attend to this matter in the different districts.

The most remarkable point in these tables of wages is the slight difference they show between the wages of agricultural laborers and those of men employed in the building trades. A farm laborer earned 4s. a week for three-fourths of the year, and 3s. 6d. for the remainder. In the corn and hay harvest he received a shilling a day, which was equal to the wages of what is called a "master-mason." A journey-man mason earned no more than 5s. 6d. a week.

ARTICHOKES FOR FODDER.

ED OF RURAL:—My experience with the Artichokes, this year, is as follows:—The roots were in the ground near a ravine that runs by my lot. They sprouted very soon in the spring, and furnished good green food for my cows in advance of everything except my winter rye. A second growth was mown some time ago and the shoots are running up again. The tubers are not large, seldom an inch in diameter; but are often quite long. A neighbor tells me that he killed them in a field, last year, by repeatedly mowing the stalks. My opinion is that they will not be killed in that way, unless they are cut down very low and in the summer. I shall prize mine as a means of supply of green forage in the first of the season.

I have just dug my early Vermont potatoes. They are about the best in quality, when first used, of any potato I have ever tried. They grew to good size, but the quantity was relatively small. This is the first season they have been planted here. N. C.

PROBLEM.—How "the purification of cities by the fertilization of the country" can best be effected.

DON'T BE DISCOURAGED.

One who ceases his struggles in despair while swimming, immediately sinks unless floated by foreign aid; and this is the general result in all the affairs of life. If a man, in falling or jumping overboard from a vessel, has some buoyant article attached to his body, or one is thrown him afterwards, he may be able to float many hours even with little hope of a rescue in the end; still, resolute courage and great hope will generally do much toward preventing total exhaustion and loss of life.

Now what is true in case of accident, is equally efficacious in preventing serious disasters in business. The man who walks boldly forth among his associates, putting his own shoulder to the "wheel of fortune," helping to prevent its revolving the wrong way and thereby becoming a wheel of misfortune, stands a far better chance of succeeding in all his undertakings than the one who becomes discouraged at every obstacle thrown in his path. It is certainly quite natural that a man should step more briskly and look more cheerful when fortune smiles upon him than when she frowns, but he will seldom gain anything by heeding the latter.

Never before have the people of this country been placed in a more peculiar and anomalous position than they find themselves at this time. There is an abundance of all the necessities and luxuries of life, for there never have been greater crops, taking the whole country together, than in this, our Centennial year; in fact, the great ship of agriculture seems to be so heavily laden that there is no known power at this moment capable of giving her a rapid motion. We have no occasion to "go down to Egypt for corn," as our granaries are full and enough to spare; but the horn of plenty appears to be full the country over, hence customers are scarce.

This state of affairs is certainly somewhat irritating to those who have money obligations to meet; but it is better than a famine, or very short crops. Ever so low prices for labor and all manufactured articles, is in part, if not wholly compensated by the abundance of food; for without the latter, there can be none of the former. We hear of many of our farmers who say they are about discouraged at the low rates and slow movements of farm products generally; but despondency will certainly do no good, while the opposite may; consequently, we say, hold on; sacrifice as little as possible; reduce expenses wherever practicable; weed out unprofitable animals, but do not kill off whole flocks of sheep because wool is low, or dispose of cows on account of a depression in the price of butter and cheese. The prices of farm products are always open to fluctuation from year to year, and the man who can hold to a steady cause is certain to reap the benefits of high rates which will offset any losses occurring through a glutted market. It is the old story of the race between the hare and the tortoise—the one who proceeds slowly but steadily is far more likely to win than he who undertakes to make frequent changes in order to fill the sails of his craft with every passing breeze. Wool, beef, butter, cheese, corn, cotton, wheat, and similar staple articles, are always in demand, although the price may fluctuate; still, the producer knows that they are necessities which no freak of fancy or fashion can rule out of the list or drive from market. Hold on and be not discouraged, is the best panacea for dull times and low prices of farm produce.

SUMMER VISITORS.

About this season of the year many of our Rural friends are congratulating themselves that the time has arrived or is near at hand for their relatives and friends from the city to wend their way homeward. This may seem to be an extreme statement; but its truth will strike directly to the heart of many an overworked farmer's wife and daughters who generally have to bear the brunt of this annual immigration. Not only is it a pleasant and physically profitable thing to do, this going to the country, but it has become the "fashion" among denizens of large cities. And what better place is there on earth to go to than Uncle Henry's on the farm? Then, too, Aunt Sarah makes such delicious pies and cakes, both so appetizing after the sweet home-made bread and fat poultry. And eggs and milk are plenty and cheap, not to mention the fresh-made butter. Aunt Sarah however, has the other side of the picture. Uncle Henry has just begun to pay off the mortgage on the farm and must economize in every way. Hired help is too great an expense to be thought of so long as Aunt Sarah and the girls have willing hands. He would like to give the girls greater educational advantages; but the thing of vital importance is to get the mortgage paid off and rid himself of its burden of principal and interest. The schooling would require more money and additional help in the household duties to replace the hands which are folded during study, so that the girls must work. Poor Aunt Sarah, feeling that half a loaf is better than no bread, saves the girls all she can and thereby increases her daily burden, already too great for her strength.

Things are just moving nicely and the sales are producing money with which to lift that mortgage on the farm, when a letter is received from Cousin Maud, saying that "Ma, Jennie, Charley and I will all make you a nice visit and stay all the month of August, and Pa will come up on Saturdays and stay over till Wednesdays of each week. Won't that be nice and won't we have a jolly time?" Yes, Maud, it will be nice and you will have a jolly time; but what will Aunt Sarah and the girls be doing all the time? They will first put all their blessed heads together and resolve themselves into a thinking committee of ways and means upon extra bedrooms and bedding for the accommodation and comfort of the expected guests. Then the provisions must be looked to. When Uncle Henry comes in at night he receives information of the intended visit with equivocal pleasure; but Ma and her children are his sister, nephew and nieces and what can he say? What ought he to say? He ought to say exactly as he would say to his own immediate family, "While I am trying to pay off the mortgage upon my farm, I must practice such strict economy that my circumstances will not permit my entertaining you this summer." But this requires too much courage for him, so he gets one of the girls to write Maud that they will be delighted to see them all.

The month of August arrives and with it the visitors. A warm welcome is extended and then Aunt Sarah and the girls go into the feeding business on a large scale, the additional cost of which would pay for the girls' schooling and the hired help to take their places. Pa comes too, each week, and while he is with them the horses must be taken from their farm work and used for pic-nics and riding parties. Aunt Sarah and the girls sit up half the night preparing the next day's lunch. This process is repeated every little while, for "It is so delightful, you know, to let the children enjoy the pure air and see the country." Well they come, they see, and they conquer, all because Uncle Henry had too much pride and lacked the courage to tell the truth to his own sister.

While this picture is not true in all cases of visits to relatives and friends in the country, it is too frequently the case and should be well considered by all city people before making their annual playtime a matter of severe labor and expense to their rural friends. The best way, after all, is to pay your way wherever you go and go but seldom where that privilege is denied you through a mistaken sense of courtesy or hospitality.

"HORTICULTURAL EDUCATION."

Mr. Parsons in his interesting article under the above title, published elsewhere, deems ten years not too long to acquire a sufficient knowledge of landscape gardening. It is a truth, however, that while a great majority of our people, satisfied with proclaiming their love of flowers and plants, are not willing to give the time necessary to distinguish by name one from another, or any thought to the great necessity that exists in this money-grabbing land, of establishing horticultural institutions of learning—there is little need of the thorough landscape gardener; little encouragement for him to peruse the varied and expensive courses which are essential to a comprehensive understanding of this noble art.

It is true, as Mr. Parsons says, that wealthy people are ready to pay $500 for a piece of furniture that would be as truly beautiful and useful at fifty; but when the garden and grounds are to be laid out, the smallest, meanest allowance is made. Trees, shrubs and flowers are selected and purchased as if the purchaser were blindfolded. They are stuck in the ground here and there, without the slightest care or knowledge of their forms in maturity or the situations in which alone they can thrive. Such plantations, though it is true they add a species of beauty and finish to the home—since trees and shrubs, however wretchedly selected and distributed, are objects of beauty—must, nevertheless, fail to afford that lasting delight and satisfaction which an educated taste would have secured.

Our people in most of the other trades, arts and sciences, are the peers of older countries—but in all that pertains to floriculture, arboriculture and landscape gardening in their every branch, we are pitifully behind—pitifully indeed, when we consider the quiet gratification, the inspiriting, exalting effects—the moral tendencies of homes so surrounded with verdure as to show artificiality in its studied concealment alone. The shade of trees, the luxuriance of their healthy growth, the beauty of a pleasing presentation of their many shades of green; choice though never profligate displays of flowers—as concentrated manures must in measured quantities be spread over fields of soil—together constitute one of the most fertile sources of life's purest pleasures.

We would feel proud if the Rural New-Yorker could be made instrumental in cultivating a love of this art proportionate to the enlightenment of our people in other branches of tasteful, useful and moral learning; and pursuant to such an aspiration, our first and deeply respectful request would be that our scores of "Rural" namesakes would, under their headings of "Floriculture," "Landscape Gardening," "Arboriculture" and "Horticulture," fill their columns with other subjects than those of Dahlias, Hyacinth glasses, Hedges, Weeping Willows, Hybrid Potatoes and Artichokes.

RURAL NOTES.

The Locusts Again.—Once more the Rocky Mountain locusts have commenced devastating extended regions of country in Colorado, Nebraska and Minnesota, contrary to many assurances that such a visitation was not at all likely for several years to come. Gov. Pillsbury of Minnesota has published a letter in answer to one from some prominent gentleman of the State, asking for advice, in which he says, "I believe the the time has arrived when an organized and determined effort for their extermination," &c.; to which we say amen. But would it not be well to know something of the source from whence these pests come, and endeavor to "nip them in the bud," instead of making an attack upon the full-fledged insect? After a few more millions of dollars' worth of property has been destroyed, perhaps State or National aid to the amount of a few thousands can be secured to enable a commission of intelligent practical entomologists to investigate and report upon this subject.

The Drought.—From Germany, Holland, England, Ireland, and some parts of France, we have the same news of a drought which, in some instances, has seriously affected the cereal crop. In addition to all this we are informed that "In consequence of the continuance of the drought in China, the imperial authorities prayed fifteen times with great ceremony for rain. As rain did not come, an edict was issued forbidding the slaughter of animals for three days, it being supposed that the harmony between heaven and earth would thereby be re-established."

Holding for High Prices.—As an instance of the disappointment some persons are liable to experience from holding their produce for high prices, we note that tobacco planters in Ohio who refused 9c. a pound for 1874–75 are now selling the same stock at 4c. It is far the best policy, take one year with another, to sell a crop soon after it is ready for market than to hold it over a season and run the risk of loss and still lower prices.

RURAL BREVITIES.

Geo. Grant of Victoria, Kansas, will exhibit some fine live stock at the Centennial.

Mrs. Cresswell will greatly oblige us by giving her street number, as letters fail to reach her.

Nearly as often as once in three years a drought can confidently be expected, and yet its coming finds everybody unprepared for the emergency, which is now almost a periodic certainty.

Sales of Short-Horns this season show no falling off in the general appreciation of the breed. The demand for them in Japan is likely to open a new market and aid in keeping up prices.

The Canada Farmer says it has heard nothing but favorable reports of the "Gold Medal Wheat" this season, and we should be pleased to hear from the readers of the Rural New-Yorker in regard to this variety.

Subscribers will please accept our thanks for the many kind expressions of commendation which we are daily receiving through the mails and also our assurance that the Rural's watchword, "Excelsior," shall be constantly before our eyes.

The loss to the French vineyardists this year, through the depredations of the *Phylloxera*, or grape louse, is estimated at $27,000,000. A reward of $60,000 is offered by the French Government for a cheap and efficient destroyer of this pest.

Whether to plant this fall or to wait until next spring, is a question that soon must be decided. We again remind our readers that the opportunity to plant Centennial trees is fast drawing to a close—an opportunity that will probably not occur again in some time.

Some of our readers may remember that a grain was advertised and distributed in 1870 under the name of "Montana Rye;" the same thing is now offered by certain parties as "Nevada Rye." We should be pleased to hear from any one who has had experience with this grain.

The weekly press now seem to be following in the Rural's wake upon the treatment of Agriculture at the Centennial. We notice that several sleepy contemporaries have actually discovered that something is wrong in Philadelphia. Go ahead! friends! Perhaps by 1976 you will discover that there existed such an institution as the "Centennial Dairy Ring."

Where is Europe's boasted civilization, when Turkey, under its immediate nose, is permitted to exercise brutality, cruelty and barbarity, in its Servian war, of a kind which would put to blush the most ferocious North American savage? Tortures which the fiendish ingenuity of the old Spanish Inquisitors never dreamed of are said to be not the exception but the rule with the Turkish soldiery.

THE OLD SCISSORS' SOLILOQUY.

I am lying at rest in the sanctum to-night—
The place is deserted and still—
To my right lie exchanges and manuscripts white,
To the left are the ink and the quill—
Yes, the quill, for my master's old-fashioned and quaint,
And refuses to write with a pen.
He insists that old Franklin, the editor-saint,
Used a quill, and he'll imitate Ben.

I love the old fellow—together for years
We've manured the Farmer's Gazette,
And although I am old, I'm his favorite shears,
And can crowd the compositors yet.
But my duties are rather too heavy, I think,
And I oftentimes envy the quill,
As it lazily lays with his nib in the ink,
While I'm slashing away with a will.

But when I was new—I remember it well,
Though a score of long years have gone by—
The heaviest share of the editing fell
On the quill, and I think with a sigh
Of the days when I'd scissor an extract or two
From a neighboring editor's leader,
Then laugh in my sleeve at the quill as it flew
In behalf of the general reader.

I am being paid off for my merriment then,
For my master is wrinkled and gray,
And seldom lays hold of his primitive pen
Except when he wishes to say:
"We are needing some money to run this machine,
And subscribers will please to remit;
For the last load of wood Jones brought us was green,
And so knotty it couldn't be split."

He is nervous and deaf, and is getting quite blind,
(Though he hates to acknowledge the latter.)
And I'm sorry to say it's a puzzle to find
Head or tail to the most of his matter.
The compositors plague him whenever they see
The result of a luckless endeavor,
But the darling old rascal just lays it to me,
And I make no remonstrance whatever.

Yes, I shoulder the blame—very little I care
For the jolly compositor's jest,
For I think of a head with the silvery hair
That will soon, very soon be at rest.
He has labored full long for the true and the good
'Mid the manifold troubles that irk us,
His only emolument, raiment and food,
And—a pass now and then to the circus.

Heigho! from the past comes a memory bright
Of a lass with a freshness of clover,
Who used me to clip from her tresses one night
A memorial lock for her lover.
That dear little lock is still glossy and brown,
But the lass is much older and fatter,
And the youth—he's an editor here in the town—
I'm employed on the staff of the latter.

I am lying at rest in the sanctum to-night—
The place is deserted and still—
The stars are abroad and the moon is in sight
Through the trees on the brow of the hill.
Clouds hurry along in undignified haste
And the wind rushes by with a wail—
Hello! there's a whopping big rat in the paste,
How I'd like to shut down on his tail!

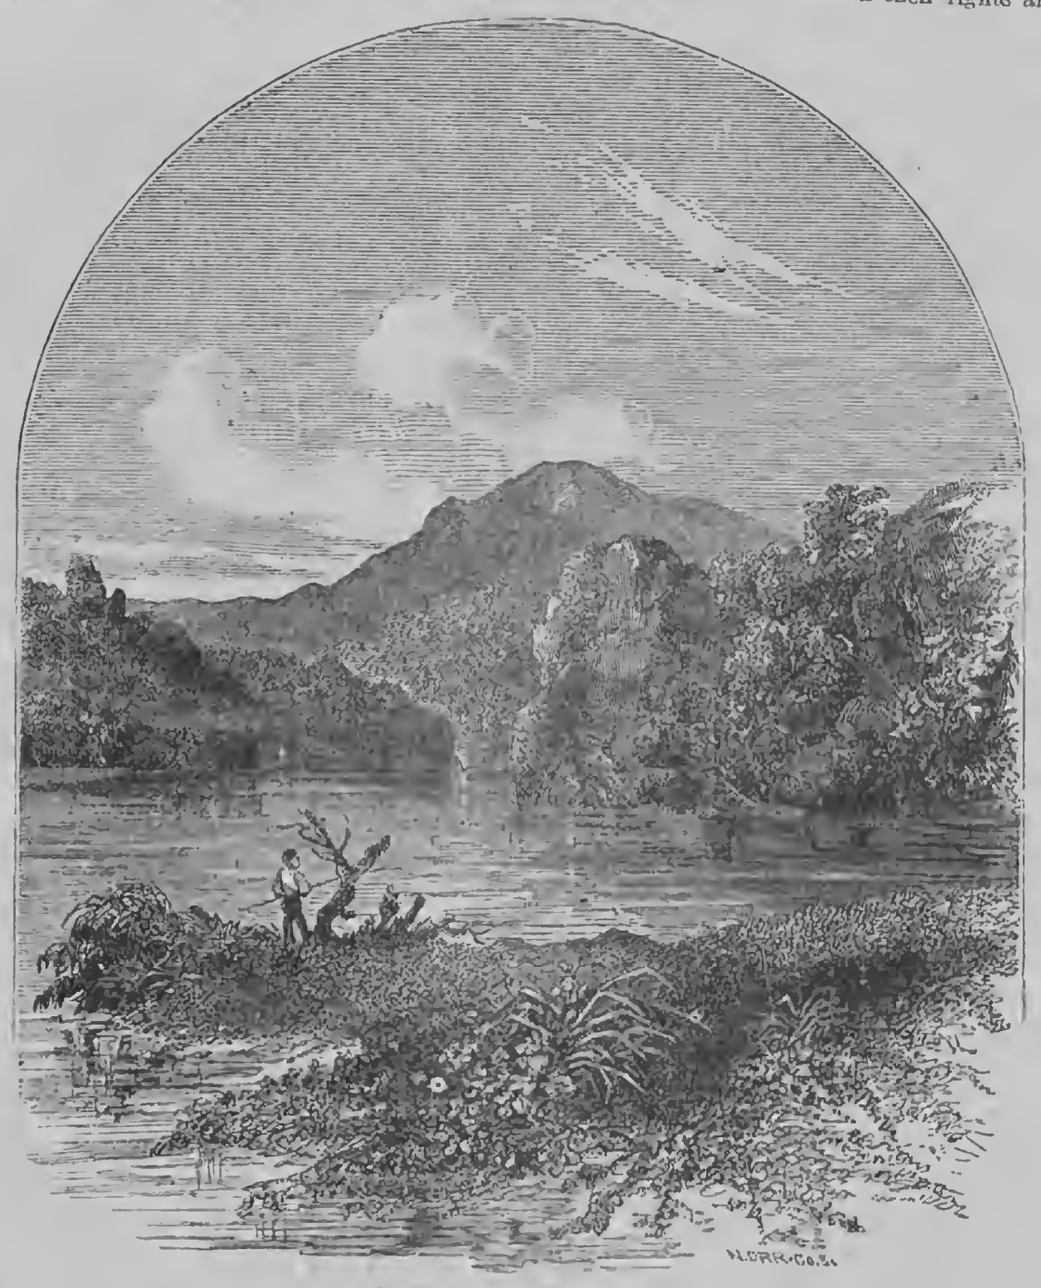
[*Parmenas Mix.*

AMERICAN SCENERY.

Having given a series of cuts illustrating scenery in the famed Far West, we give this week views of characteristic bits of scenery near the Atlantic.

The Juniata River, which wends its devious way through Pennsylvania, presents a succession of exquisite views, and nowhere, perhaps, can the lover of still life indulge his fancy as fully as among these sylvan scenes.

On the other hand, the "Scene in Lake Superior Country" approximates to the wild beauty of the Yellowstone Park. The cool, limpid streams and fresh mountain breezes of the northern peninsular of Michigan, have offered strong attractions to the lover of nature as also the insatiable sportsman. In brief, wherever we go in our most favored country, exquisite scenes open up before us that differ in beauty only in degree. When the famous New Zealander, of Macauley, shall have turned his steps hitherward and stamped our scenery as the "Authority" of his hyperborean judgment (?) we Americans may finally realize that there are marvels of natural scenery existing in our midst that are uncqualled by the famed European localities.



ON THE JUNIATA.

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 141.]

Spanish Claims to the Mississippi River.—Soon after the treaty of 1783 between Great Britain and the United States, Spain made claim that her treaty with Great Britain in 1730 conveyed to her the country bounded as follows;—"A right line should be drawn from the eastern angle of the Gulf of Mexico to Fort Toulouse, in Alabama; thence up the river Louishatchie from the mouth of which a right line should be drawn to the Fort of Quesnassie; thence by the course of the Hiawassa to the Tennessee; down the Tennessee to the Clinch; thence in a right line to the Cumberland; down which to the Ohio. All west of this Spain claimed and maintained that its possession gave them the sole ownership of the Mississippi from latitude 31° to its mouth. The country thus claimed embraced parts of Kentucky and Tennessee and nearly all of Mississippi and Alabama.

The United States claimed all described for her in the treaty of 1783 and the free navigation of the Mississippi. Spain had occupied a considerable portion of the country on the river for several hundred miles above 31°, while an active trade had sprung up in the settlements in the Ohio valley, the natural outlet for which was down the Mississippi River. Spain established posts on the river and forbade the passage of any boats unless they had first paid such imposts and taxes as it was thought fit to demand. Payment of these taxes were in many instances refused, in consequence of which cargoes were seized and confiscated and persons fined and imprisoned. At this the feelings of the people of the entire West were aroused.

SCENE IN LAKE SUPERIOR COUNTRY.

Meantime, the Spanish Government was negotiating with the Federal Government for a settlement and in view of some concessions favorable to the older portions of the Union, Mr. Jay, then Secretary of Foreign Affairs, proposed to *forbear* to use the Mississippi River below 31° for twenty-or thirty years, while still claiming to use the right acquired by the treaty of 1783. In favor of this plan were the seven Eastern States; opposed were Maryland, Virginia and the Carolinas.

The spirit of the Western people, unused to restraint of any kind, was impatient. They believed they asked no more than their rights and those they were determined to maintain. The feasibility of the plan of fitting out an expedition to seize New Orleans and take possession of all Spanish territory east of the Mississippi, with or without Federal aid, was openly discussed.

At this period Col. Wilkinson visited New Orleans and obtained some concessions from the Spanish Government by which the rigor of the laws was somewhat relaxed. There are differences of opinion as to whether he acted in entire good faith—whether or not he was intriguing for his own aggrandizement, to separate the West from the Union and establish a Southwestern Confederacy. But it is evident he had not the interests of Spain in mind; although his policy appears to have been to prevent antagonism and promote harmony between the Western settlers and Spain and, for a while, there was a feeling against the Federal Government that might, with little influence, have been wrought up to a point of separation. But this was of short duration. Spain drew the lines closer and the Western people again became antagonistic.

Meantime settlers crossed the claimed Spanish lines and the Court at Madrid was warned that the American ambition on the subject of territory would not be appeased, and that the only true policy was to attempt the dismemberment of the Union. This advice was well received and the actions based upon it resulted in a series of controversies that extended through many years.

And now war broke out between France and Spain and French emissaries endeavored to incite the West to invade Louisiana. Spain knowing of this, sought to counteract it by holding out inducements for and inviting disunion, promising aid therein on the one hand and threatening to close the navigation of the river forever if such disunion was not effected.

At length, wearied with the matter, Spain expressed a willingness to negotiate, and a treaty was concluded in 1795 which, it was supposed, covered and settled the whole question.

But Spain could not be satisfied, and again proposed that a new South-western Government be established, but without effect. With the free use of the Mississippi the West had no occasion or desire for dismemberment; the boundaries were soon fixed, the posts surrendered as had been provided for in the treaty, and the contest that had kept the country in a state of ferment for more than ten years, was at an end.

TENNESSEE.

Early in 1769 people from North Carolina formed the nucleus of the first white settlement in Tennessee. This was in the Watauga country. It was really only an enlargement of a settlement of Virginia near by and was supposed to be within the limits of Virginia. Others soon followed and some pushed further into the wilderness. This was about the time Boone went to Kentucky. The settlement on the Watauga soon received additions from North Carolina, South Carolina and Virginia, and became the center of a settled territory of considerable extent.

In the meantime political difficulties arose in North Carolina. A number of men calling themselves "Regulators," opposed the Government in what they claimed, and is now believed justly, illegal taxation; but not being able to sustain themselves, they crossed the mountains and, beyond reach of the officials, were gladly welcomed at Watauga. Doubtless their enmity to the Government, added to the fact that the settlement was so far distant that it received neither aid or protection from it, hastened the action which in 1772 was taken, eventuating in a determination to pay no further attention to the laws of the province but to govern themselves, which they did through a board of five commissioners elected by the settlers. A lease for eight years was obtained from the Cherokees for "all the country on the waters of the Watauga," and the laws of Virginia were mainly adopted as their basis of Government. In the same year the boundary line between North Carolina and Virginia was declared to be in latitude 36° 30′—this fixed the line between Tennessee and Kentucky.

In 1775 the Indians ceded to the Watauga Association all the lands lying between the Kentucky and Cumberland Rivers, and early in 1776 the Association was, on petition, annexed to North Carolina as a District and was allowed to send a delegate to the Provincial Congress. The District was named Washington—the first time, I think, any territory was so honored.

In 1777 Washington District was made into a County. The Henderson purchase—before spoken of (see Kentucky)—extended into the Watauga District and, for a time, occasioned considerable trouble.

In 1784 North Carolina passed an act ceding to the United States her title to lands west of the mountains, embracing the now State of Tennessee, then divided into four counties—Washington, Sullivan, Greene and Davidson—reserving jurisdiction and sovereignty until the conditions of cession should be accepted, but no further consideration repealed the act the same year. The settlers in the country thus ceded and not ceded, feeling that North Carolina had virtually abandoned them and having need of an active government, called a Convention, by the action of which they erected themselves into an independent State and called it the "State of Franklin." Thereupon they were declared by North Carolina to be in revolt and were both entreated and commanded to return to their allegiance. But the new State continued to exist until 1788, when its Governor (Sevier) was arrested on a charge of high treason. While on trial, by the aid of friends he escaped from the court room. Meantime, the State had ceased to exist and the territory was once more under the jurisdiction of North Carolina. Sevier was subsequently pardoned and was the first member of Congress from the Mississippi Valley.

In 1789 North Carolina again voted to cede the territory to the United States, subject to the land warrants already issued which covered a greater portion of it, and also to the restriction that no regulation should be made by Congress tending to the emancipation of slaves. Congress accepted the cession in the same year and soon after passed a law for the government of the Southwest Territory, which included Tennessee and Kentucky. Much excitement was caused in Tennessee, as elsewhere in the Mississippi Valley, by the Spanish claims relative to the navigation of the Mis-

sissippi—elsewhere spoken of—but no definite action was taken.

In 1795, by an enumeration of inhabitants, it was found the territory contained more than the number required before they could be entitled to a State Government. A Convention met at Knoxville, January, 1776, which formed a Constitution, and in June of the same year Tennessee was admitted to be one of the sixteen United States of America.—[To be continued.

The Story-Teller.

SPIRITUAL RAPPINGS.

BY GERALDINE GERMANE.

"DEAR me! I wonder why CHARLIE doesn't write. It's been more'n a week since I've heard from him and I'm afraid something is the matter," said CARRIE, as she threw herself on the carpet beside me.

We had been upon the hillside—or, more properly, mountain side, it being at the northern extremity of the Alleghanies—to drive the cows home for milking, and lingering about the old barn and then among the hollyhocks and marigolds in the dooryard, we came in at twilight with the romance of a many-hued mountain sunset upon us and, being weary with our upland tramp, untied our sun-bonnets from our shoulders, took off our shoes and stockings, and sat down on the floor with our knees on a level with our chins to rest and chat when, as girls *will* at every opportunity, CARRIE began about "her CHARLIE."

"Haven't heard from him in more than a week?" I repeated; "I'd like to know how often you expect to hear from him?"

"Why, I've had a letter from 'im as often as every other day since he's been gone. You know he went to Ann Arbor, Michigan, to study for a doctor, and is going to stay a whole year. It seems like an age and as though he was a great way off, an' when he went away I told 'im maybe he'd never come back. 'O, yes, I shall,' said he, trying to cheer me up; 'you know we've always been together *so* much.' 'But what if you shouldn't live to come back—what if you should die way off there 'mong strangers?' said I. 'Why, then my spirit shall come back and hover 'round and talk to you,' he said, laughing. I don't see, for my part, how he could laugh, for I felt as solemn as a church and as dismal as a churchyard to think of it. Do you believe, GERRY, there is any such thing as a person's coming back to visit their friends after they're dead?"

"Well, I don't know but they might, but I guess it's very seldom they do, and I don't believe anybody ever saw or heard them."

"Then you don't believe in spiritual rappings?"

"No, indeed."

"It was bad enough," she continued, "to have CHARLIE go away; but my thinking he might never come back made me feel ten times worse, and I told him he must be sure and write very often and if he was sick or anything happened to him to be sure and let me know it, so that I could go to him, and I don't see why he has waited so long about——"

Rap, rap, rap, right under the floor where we were sitting.

"What's that?" said CARRIE, with wide open eyes.

"Guess it's rats," said I, rocking back and forth lazily.

"No, tisn't; for there isn't a rat about the house."

"Then you must be better off than most people."

Rap, rap, rap, rap.

"For mercy's sake! GERRY, what is it?"

"I wouldn't wonder if 'twas a cat in the cellar."

"No cat could go in there; there are two outside doors, shut and barred and the windows are grated so that no earthly thing could get in!"

Rap, rap, rap.

"O, it's spirits, it's spirits!" she said, in an awe-struck whisper. "CHARLIE's dead! O, CHARLIE's dead! and his spirit's come back, just as he said it would."

"A'n't your mother or father down cellar?" I asked, faintly.

"O, no, no! They've been abed this half hour and are sound asleep by this time," in the same whisper.

Rap, rap, rap.

"What *shall* we do! O, what *shall* we do?" and CARRIE's face grew whiter and whiter and her eyes stood out farther and farther.

"Go to bed," said I, trying to appear unconcerned; for I wasn't going to let her know that I was frightened.

"You don't catch me going to bed with that rapping right under us!" she said, excitedly.

"Pshaw! it won't rap through the floor, and if we go to bed and get to sleep, we shan't hear it any longer; and whatever it is, it may rap as long as it pleases."

Rap, rap, rap.

CARRIE said nothing; she only trembled from head to foot and grew more ghastly in her terrible fright. I felt as though I would like to be protected by the bed clothes and said, "Let's go to bed."

She shook her head.

"Then let's go and see what it is," I said, in as brave a voice as I could muster.

"Mercy! I wouldn't stir out of this room for anything! I wish the door was locked," she whispered.

"Well, I'll go," said I, rising up.

Rap, rap, rap, rap.

"O, don't leave me! don't leave me alone!" she gasped, clinging to my skirts.

"Then go and get your father to see what it is. It must be *something*, and we can't stop here all night and listen to it."

"O, 'twouldn't do any good; he couldn't find 'em—it's spirits. It's CHARLIE'S spirit, and he's dead!" she moaned.

"Fudge! CHARLIE would have more manners than to go thumping about and scaring folks in this way!" I impatiently exclaimed, "and I shall go if you don't;" and I moved determinedly toward the door.

"O, don't! O, GERRY, don't!" and she clung to me like a dead weight, trying to hold me back; but I kept on through the hall and the long, dark dining-room, groping my way with one hand and dragging her after me with the other, until I came to the bedroom where her father and mother were making the air resonant with their sonorous breathing. They were sleeping so soundly that I had many misgivings in regard to waking them; but, hoping that under the circumstances they would excuse me, I said feebly, "Mr. WESCOTT, Mr. WESCOTT!"

The only answer was a lusty snore, which wound up with an exhalation that sounded like hot air bubbling up through a kettle of boiling mush, and I repeated, louder:

"Mr. WESCOTT, Mr. WESCOTT, there's spirits in the cellar."

"Yes, yes," he murmured. "I know some folks call it speerits; "but it's nothing but blackberry wine, with a leetle cherry brandy in it. It's perfectly harmless. My old 'oman made it herself, an' it won't hurt ye, even if yer a Good Templar an' hev signed the pledge; per-fect-ly—harm-less; p-e-r-f-e-c-t-l-y—h-a-r-m-l-e-s-s."

Then he turned over, grunted like an over-fed porker, and began to snore again.

I was about to give up in despair, but I could still hear that rap, rap, rap, rap, sounding from the subterranean depths and, determined to have the mystery solved, I said, "CARRIE, you wake 'im up."

Being in the presence of her parental protectors had somewhat restored her; but whether she was afraid of rousing the wrath of her sire at the same time she aroused his senses, or of perpetrating a joke at her own expense, I know not. I only know she whispered, "I dusn't; you tell 'im." So I called yet louder:

"Mr. WESCOTT, Mr. WESCOTT, there's something in the cellar. CARRIE and I have heard it ever so long," I added, by way of explanation.

"E-e-h—something—in—the—cellar, d'ye say?" said he, rubbing his face and eyes and stretching up his arms as though to make sure that it was himself and not one of his neighbors that had been awakened. "Light a candle, CAROLINE, an' go 'n see what 'tis."

"O, father, I don't want to."

"Don't want to? Why, you ain't afeerd, I hope. Ef yer be, GERRY 'll go with ye."

"Why, father, I wouldn't go down there for anything; it's spirits, I know 'tis, for it rapped three times, and they always rap three times."

She did not tell him it was CHARLIE'S spirit.

"More likely it's them JONESES a stealin' pork; it's 'bout time for 'em to be 'round. I'd jes like ter ketch 'em at it!" he said, rising up excitedly. "GERRY, you light the candle; it's on the kitchen table. CAROLINE'S got so much speerets in 'er head, I don't spose she'd ever git it lit."

By the time I had the candle lighted the old man had sprung out of bed and hurried on his nether garments. His better half, disturbed by the unusual commotion, rose up to a sitting posture and putting both hands to the top of her head, as if to see if that and her night-cap were in place, said sleepily:

"What's the matter, SOLOMON? Where yer goin' to?"

"Thieves an' robbers," said SOLOMON, rushing through the kitchen toward the cellar door.

"Thieves an' robbers! land o' gracious, thieves an' robbers!" screamed the old lady, rolling off the bed as fast as her corpulence and rheumatism would permit, and rushing after him with her night-dress and cap all awry. "Take yer gun, SOLOMON—take yer gun, SOLOMON; you'll be killed as sure's preachin!" and running to a corner she grabbed the clothes stick and, thrusting it down the cellar stairs, shouted, "Here's yer gun, SOLOMON, here's yer gun; you'll be killed as sure's preachin'!"

Although SOLOMON did not avail himself of the proffered weapon, he was not killed but came back uninjured with the family cat in his arms which, by feline tactics, had crept into the cellar unobserved before the doors were closed, made a raid upon a tub of soap grease and, squeezing herself under the loose board cover, in the operation of gnawing and pulling at the scraps and bones, had moved it up and down against the tub, making the spiritual rappings. SOLOMON put the cat out of doors.

His better half gave a quick glance at her night dress and clothes stick, slipped the latter behind the pantry door and with "Land o' gracious! how scart I *was!*" waddled back to bed.

CARRIE and I slunk back to the spare bedroom and "slowly and sadly laid us down."

P.S.—The next day CARRIE received a long, loving letter from CHARLIE and his spirit was yet in the body, with no prospect of an untimely departure.

P.P.S.—She didn't marry him though, but mated with a practical, thorough-going young farmer as much unlike him as possible; and I don't believe people who write to each other every other day and are so very much engaged, ever *do* get married.

HARD TIMES.

BY N. M. H. M.

THE RURAL in a recent issue says:—"If people would learn to be more skeptical and less confiding, truth might in a great measure take the place of error. But it is so much easier to accept a statement as truth than to investigate and *know* it, that a majority of persons choose the former, absorbing what is generally termed knowledge just as a sponge does water, taking in the impure as readily as the pure, possessing neither a desire or power of making a selection."

And was there ever a time when thinking for one's-self was more essential than now? The "hard times" are upon us with iron gripe, and it behooves every man, woman and child to find out the cause. Do not, in this emergency, depend upon what somebody else says, but think for yourself. Do not take for granted that your newspaper must be right; you know how strong the inducement to please one's party or patrons, and how small a thing may serve to make falsity appear to be truth; so think for yourself, and in this thinking be not prejudiced. Remember always that there are two sides to every question, and that those who see it in one light present it according to their view, while those who see it in another will give it an entirely different aspect.

Therefore, do not trust to the investigations or representations of others but think for yourselves, and in order to form an unbiased judgment, keep your minds always open to Truth, and then carefully consider both sides of the question, using such light and help as may be had from the reading and listening to the best thoughts of the best minds on both sides.

Now, as regards the "hard times," all admit that there must be a *cause*. All have thought about it, because it is driven home into the very bone and marrow of many thousands and is felt with more or less severity by millions more. But how many have thought or *tried to think* for themselves, as to the *cause* of all this dread suffering?

One man—or set of men—says that Inflation is the cause; another says it is Contraction; one says it is over-production, which came as a result of inflation; another says it is anti-consumption, which necessarily followed contraction. One says it is over-issue of greenbacks; another that it is the removal and destruction of greenbacks. One says it is "soft money," and another, that it is the attempt to enforce "hard money"—and so each set has their own theories.

But it is a fact that many of these men who are loudest and strongest in their advocacy of a certain theory, admit, when you talk plainly with them, that they themselves have never tried to think the matter out, but have accepted the ideas of somebody else; and by tracing it back, we finally learn that the original thinkers upon these matters are very few and that they, from motives which may be either true or false, either philanthropic or selfish, have led the masses who, like a flock of sheep, will follow, pell-mell, along whichever path their leader takes.

Everybody has heard of the Resumption Act, by which Congress authorizes the removal of greenbacks and the resumption of specie payments, as the saying is. Everybody knows that it is the hard money men, the contractionists—those who say the panic is due to inflation, to soft money, etc.—that proposed and carried this bill through Congress and are fighting for it to be pushed on to the end. Everybody knows, too, that it is those who are in favor of greenbacks and who think the panic due to their contraction, that are fighting against the Resumption Act and looking for its repeal.

But how many have ever read and thought upon this same Act and its bearings, promises and demands? I venture to say not one in ten thousand of the forty millions in the United States *know for themselves* anything about it! and yet it is of vital import to all. It has in it either the elements of happiness and prosperity or of suffering and ruin. It will coin for us all the delights of home and all the enjoyments of life, or sap our very life-blood till only bitter waters are found flowing in our veins.

Do not pass it by as something that belongs only to the consideration of politicians. It belongs to you, reader, and to me. It involves the welfare of each member of the great United States' Firm, and each one should look to it that he be not deceived and ruined. Each should know for himself what course with regard to it will secure the greatest good to the greatest number.

MEMORIES.

WHEN the gray twilight softly spreads
Her robe o'er earth and sky;
When the far mountains' shady heads
Are lost to human eye;

When the tired bird at eve has sought
Sleep in that tuneless bower;
When the last bee wings homeward, fraught
With the forage from the flower;

When the dark pinewood dimly shows
Its deepening tints of green;
When in the west with crimson glows
The sunset's closing scene—

I watch the glimmering shadows kiss
The threshold of the night,
And o'er my heart's soothing bliss
Falls in the waning light;

And grosser thoughts that sternly cling
To life's dull, sober day,
Leave me, as swallows on the wing
Flit from our sight away.

And soft as ripple on the lake,
Within my bosom rise
Half-whispered yearnings, that awake
A thousand memories—

Sweet memories, that only come
To woo my waking dreams,
When twilight shrouds the woodlands dumb,
And slumbers on the streams—

Of faces that I loved of yore,
And songs that loved ones sang,
And children's voices—heard no more—
That through the greenwood rang.

O spirit treasures, ye are mine,
And to my heart belong,
Yet linger not till I repine
Or sing a sadder song;

But leave me while I still have power
To catch the sunny glow
Wafted from memory's blissful bower—
The shrine of long ago.

[*Chambers's Journal.*

A NEW DECALOGUE.

THE following, from the Elmira Gazette, is a satirical application of the commandments that, if rightly pondered, contains wholesome counsel:

I.

Thou shalt have no other God but Gain. Trade, labor, husbandry and all other brokerage, shall be his profits.

II.

Graven images and pictures other than greenbacks and fractional currency thou shalt not make. These shall continue to be unlike anything elsewhere, in the heavens above or in the earth beneath; and to them, therefore, thou mayst bow down thyself unto the thirty-third and thirty-fourth generation, using up in their pursuit all thy soul, thy health and thy neighbor as thyself.

III.

Thou shalt not mistake any other God for the aforesaid, such as Religion, True Worship, Charity, Virtue, Obedience, Truth; for Gain, being a jealous God, requires all your time, strength, health, soul and body, and will show no mercy upon those who keep not his day-book, ledger and cash books.

IV.

Remember the Sabbath day to keep it wholly to thyself.

V.

Honor thy children, bowing down to them and worshipping them, giving them what they least require, that their days may be the shortest in the United States of all lands whatsoever.

VI.

Thou shall not kill the goose that lays the golden eggs.

VII.

Thou shalt commit adulterations with almost everything in the earth beneath, and especially by the waters which are throughout the world.

VIII.

Thou shalt steal whenever an official opportunity offers. Making a Cæsar of thyself, thou shalt render unto him all the money that is brought unto thee.

IX.

Thou shalt forever forbear all witnesses against thy neighbor; let thy time be consumed needlessly in public service, and be afterwards, also, witness against thee.

X.

Thou shalt acquire so much by the foregoing commandments as not to covet thy neighbor's house and lot, nor any other real or unreal estate of his whatever.

THOUGHTS FOR THINKERS.

GRACE and glory are inseparably joined—he that gets the one may be certain of the other.

IT is backward and downward with the wicked—it is onward and upward with the righteous.

WE cannot be too thankful even for small mercies, but we may be too troubled about small miseries.

THERE is a Bible in the University of Gottengen written on two thousand four hundred and seventy-six palm leaves.

NO man ever yet forgot by trying to forget; but he is on the highway to forgetfulness when he tries to remember.—*Miss Braddon.*

Ladies' Portfolio.

MAUD MULLER.

(A Travestie.) After Whittier—a long distance.

BY BROWNE.

MAUD MULLER on a bright May day,
Was planting peas in Jersey clay,
Beside her stood the unctuous jug,
The sunbeams shone upon her mug,
Till dawned upon as sweet a smile
As e'er lurked 'neath a dollar tile.
Thus working on without a sigh
She saw a milcman drawing nigh;
'Twas Grimes, a Justice of the Peace,
Coming to buy a flock of geese.
He, seeing Maud, did soon commence
To tie his muleflesh to the fence.
Beatified he stood to gaze,
Then asked her for a drink, bekase
He'd eaten codfish balls that morn.
Maud didn't look on him with scorn,
But handed him the milk, the same
Soon floated to the Judge's wame,
And then that Justice of the Peace
Asked if her father 'd sell some geese.
She said her pa she knew would sell
The brood of the boss goose, Floribell.
'Twas getting near the dim twilight,
So Grimes was asked to stay all night.
That night they acted much like pards,
Drinking cider and playing cards,
Till old Grimes, feeling loud and gay,
Said in a rather feeling way:
"Muller, old boss, now I'll be blowed
If I wouldn't like to marry Mowd."
Muller him by the collar caught,
And pounded well his dome of thought.
He grasped him by the pants and blouse,
And bounced him head-first from the house.
Maud wept that night till half-past ten,
And never saw the Judge again.
She wed with one unskilled in lore,
And children play around the door.
And now she says with tear-dimmed lids:
"These might have been the Judge's kids."
No matter unto whom allied,
Woman is seldom satisfied,
For looking back to some sweet scene,
She sadly sighs, "It might have been.
Or else she loud and long will buzz:
"By Gosh, it hadn't ought to was."

THE RULES OF CROQUET.

EVERY one who plays croquet, knows the disagreeable results of the diversity in rules and method of play among different players. The books which have been written on the subject are also at variance and as there is nothing but the author's or publisher's name to give authority to either book about the game, the partisan of either side of any disputed question can readily find printed support for his views. What is needed, is a set of rules which shall have some positive authority, or shall represent the combined wisdom of some considerable body of experts in the game, and not merely the opinions of any one person. A reasonably complete and sensible code having such sanction ought to be generally adopted, for the sake of harmony.

The English croquet clubs held a conference in January, 1870, at which a code of laws was adopted which are characterized by simplicity, good sense and straightforwardness. The rules have since been revised by the votes of the clubs represented in the conference, and seem worthy of universal adoption. We have been guided by them for three seasons and like them better and better. The principal points are as follows:

1. NO "BOOBY."—Rule 4.—The striker's ball, when placed on the starting-spot and struck, is at once in play and can roquet another ball or be roqueted whether it has made the first hoop or not."

2. THE TURN.—"A player, when his turn comes, may roquet each ball once, and may do this again after each point made."

3. NO TIGHT CROQUET.—"In taking croquet the striker is not allowed to place his foot on the ball." There has been a gradual abandonment of the "tight" or "foot" croquet, and a growing opinion that the "loose" or "roquet-croquet" is fairer and more scientific. At first, the foot was *obliged* to be on the ball. Then, in the treatises of Mayne Reid and the Newport Club, the loose croquet was allowed to the rover only. Afterward (Bradley's rules) the method was optional. Now, we have the scientific stroke as the only one admissible. All the rules about the flinch and the rover are now unnecessary.

4. CROQUET IMPERATIVE AFTER ROQUET.—"A player who roquets a ball must take croquet, and in so doing must move both balls." This sets at rest all question about "declining."

5. BALL IN HAND AFTER ROQUET.—When a ball strikes another it instantly becomes "in hand," and must be taken up and placed beside the roqueted ball in order to take croquet. "No point or roquet can be made by a ball in hand." For example, if the red ball, in commencing its turn, hits the blue and rolls on through a wicket, the wicket is not made, because the ball was in hand from the moment it struck the blue. Again, if the red should by the same blow hit first the blue and then the yellow, he could croquet only the blue, but would have the privilege of striking at the yellow afterward and croqueting it if hit. You may therefore stop a ball which has roqueted another without the risk of its owner saying, "If you had not stopped my ball it would have made the wicket."

6. WRONG PLAYING.—When a ball is played out of turn, or the wrong ball used, or a foul stroke made, the general principle is that the points so made are lost, and the remainder of the turn is forfeited and the adversary may elect whether the balls shall be replaced or remain where they lie. But, if the adversary plays on without claiming the penalty, the false play holds good. Specific rules are given for the various cases under this rule.

There are a number of little special rules in the game as usually played, which destroy the symmetry of the game. It is a mistaken idea that complication of rules makes it "more interesting." This is shown by the fate of all such contrivances as the crossed hoops in the center, little bells on the wickets, etc. No croquet player who understands the game thoroughly and can play the "split-shot," the "follow," and the "hold-back," needs any such aids to give interest to the game. The following are some of the usages referred to which are omitted from the English code:—1. Taking "two shots" or a "mallet's length" as a reward for running two wickets at the same blow. The two wickets are, like virtue, their own reward. 2. "Spotting" a ball which has struck the turning stake. It should play from where it lies like any other ball. 3. The idea that a ball must move six inches to constitute a stroke. Who can measure the distance traversed by a rolling ball? If it is moved at all, it is a stroke.

Finally, if you play by these rules or by any other, remember to be strict in matters of law; but always defer to the observation of others in matters of fact.—*Scribner's.*

REFINEMENT.

REFINEMENT is not fastidiousness. It is not luxury. It is nothing of this kind. It is far removed from excess or waste. A person truly refined will not squander or needlessly consume anything. Refinement, on the contrary, is always allied to simplicity and a judicious and tasteful employment of the means of good and happiness which it has at command. It seeks to divest itself of superfluities and aspires continually to the utmost possible purity. Refinement leads to personal cleanliness and elegant neatness, good taste and simplicity in dress. All "loudness" or "flashiness" is repugnant to its spirit. In its home and surroundings—whether palatial, affluent or humble—the same chasteness and natural grace are maintained. The abode of genuine refinement and a mere pretender to it, are very different. In the former you will find no excess, gaudiness, or false glittering; but the latter abounds in it. In personal manner, refinement is most conspicuous. A man of refinement is always polite without flourish, gentle without effeminacy, and considerate without stiffness. Display and ceremony are not identical with refinement and are poor substitutes for it. There is, of course, no refinement like that of the heart, which impels its possessor to show on all occasions a thoughtful and kindly regard for the feelings of others. No adherence to etiquette can compare with it for the spontaneous observation of true and gratifying politeness.

A WARNING TO BACHELORS.

BOTTLEBURY will never dive into a creek to save another woman from drowning. He saw a red-haired girl named Sparks tumble in the other day off a boat and he instantly plunged in after her, caught her by her dress and swam to the shore with her. As soon as they were on dry land Miss Sparks gave a hysterical scream, flung her arms around Bottlebury's neck and fainted. Just then the father came up with the rest of the family and, perceiving the situation, he dashed up to Bottlebury, grasped his hand and said, "Take her, my boy; take her! It is hard to give her up—it wrenches her old father's heart; but she is yours. Bless you, my children—bless you!" Then Mrs. Sparks cried and said she hoped Harriet would be happy. The little Sparks manifested their emotion by climbing up Bottlebury's legs and pulling his coat tails. Then Harriet came to, and laying her head on his shoulder, whispered, "Kiss me, darling!" Bottlebury, amazed and indignant, tore himself away and flew. He was arrested that afternoon on charge of breach of promise, and on the trial the jury gave the broken-hearted Miss Sparks $200 damages. Bottlebury has intimated to his confidential friends that if any other warm-haired woman intends to fall overboard near him, she will find it to her advantage to learn to swim.

BOOKS FOR A HOME.

Books are not made for furniture, but there is nothing else that so beautifully furnishes a house. The plainest row of books is more significant of refinement than the most elaborately carved sideboard. Give us a home furnished with books rather than furniture. Both, if you can; but books at any rate. To spend several days at a friend's house and hunger for something to read, while you are treading on costly carpets and sitting on luxurious chairs and sleeping upon down, is as if one were bribing your body for the sake of cheating your mind. Books are the windows through which the soul looks out. A house without them is like a room without windows. No man has a right to bring up his children without surrounding them with books, if he has the means to buy them. It is a wrong to his family. Children learn to read through being in the presence of books. The love of knowledge comes with reading and grows upon it. And the love of knowledge in a young mind is almost a warrant against the inferior excitements of passion and vice.

Reading for the Young.

MANAGING A MULE.

You, Nebuchadnezzah, whoa sah!
Whar is you tryin' to go, sah?
I'd hab you for to know, sah,
I's a-holdin' ob de lines.
You better stop dat prancin';
You's pow'ful fond ob dancin',
But I'll bet my yeah's advancin'
Dat I'll cure you ob your shines,

Look heah, mule! Better min' out—
Fus' t'ing you know, you'll fin' out
How quick I'll wear dis line out
On your ugly, stubbo'n back.
You needn't try to steal up
An' lif' dat precious heel up;
You's got to plow this fiel' up,
You has, sah, for a fac'.

Dar, *dat's* de way to do it!
He's comin' right down to it;
Jes' watch him plowin' t'roo it;
Dis nigger ain't no fool.
Some folks dey would 'a' beat him;
Now, dat would only heat him—
I know 'jes' how to treat him;
You mus' *reason* wid a mule.

He minds me like a nigger.
If he was only bigger
He'd fotch a mighty figger.
He would, I *tell* you! Yes sah!
See how he keeps a-clickin'
He's as gentle as a chicken,
An' neber thinks o' kickin'—
Whoa dah! Nebuchadnezzah.

Is dis heah me, or not me?
Or is de debbil got me?
Was dat a cannon shot me?
Hab I laid heah more'n a week?
Dat mule do kick amazin'—
De beast was spil'd in raisin'—
By now I 'spect he's grazin'
On de oder side de creek.

[*Irwin Russell.*

A WORD TO THE GIRLS.

"I'LL tell you how, CLARA: don't say anything to your mother about it if she is so particular, but just tell her you are going to call on me—that won't be telling a lie, you know. We can go over from our house, and she'll never know the difference."

In spite of haste I turned to take a second look at the dainty, girlish forms thus plotting to enjoy forbidden pleasure. They were young—not more than seventeen, if that—and there was something in the tasty arrangement of CLARA'S toilet that indicated a mother's watchful care. The speaker was more richly dressed, but there was a wrinkled, neglected look in her whole attire that plainly showed the absence of a mother's refining hand. When I saw the restless, undecided look on CLARA'S face it was with difficulty I restrained myself from speaking. I wish now that I had said to her just what I say to all girls who are tempted in like manner, Don't! Do not, under any circumstances, or at any time, do that which will cause you to shrink from telling mother. But above all things, do not stoop to meanness or deception.

Now, my dear girl-friends, think of me as one among you. I am not such an ancient girl as some of you imagine—not old enough to keep out of mischief that a watchful mother would have prevented. I have to learn by bitter experience. They say that Experience is a superior teacher. I do not doubt it, still, I would rather go to school where I knew punishment was certain every day in the week than to sit dreading it all the time and only get it once a fortnight.

Experience often hardens the nature—develops the cold, harsh, sarcastic qualities which should be kept buried till we are old enough to know when and where to use them. Mother is the queen of home, and all of you who are so blessed should be proud, willing subjects. As I write my gaze is involuntarily directed to the wall. Yes, the eyes are watching me—they follow my every motion, whether near or distant in the room. It is only a shadowy face and form prisoned in its frame, yet I would risk my life to save it from harm. It is all I have of the dear one waiting for me in the "Bright Beyond." Even you who have been called to say the last good-by can remember mother's kind admonitions, and the dear, grave tone of voice in which advice was given. I have not even the fond remembrance of tender care and caress, but ah—I know what it is to feel the need of all this. Sometimes, when I grow weary and wicked, I lay my cheek close to the dear lips and pray God to aid me in my endeavor to become like her; then all the hard, rebellious thoughts vanish, and I start again with new resolves.

But 'tis a hard battle we girls fight alone. It needs a mother's wise, firm hand to direct, and a mother's stern experience to point out the various snares that are lying so thickly about our pathway. Sometimes there are dear friends who attempt to aid us, but no one so thoroughly understands our nature—no one feels so deep an interest in our welfare—as mother. Hard work, trouble and multitudinous cares wear hard on the mother's mind, and she may at times seem stern and indifferent, but I tell you, girls, there is a large, generous heart there beating for you, and a depth of love known but to the Creator. So, if you are pondering a hard, knotty question, take it to mother, and abide by her decision. If you are about to take any step out of your usual course, whether of minor or supreme importance, let mother's superior wisdom guide you. Remember the years of laborious care given to your interest and command even your thoughts to be filled with respect for her. We all know that a mother's heart seeks a thoughtful, unceasing affection from her offspring, and sadly to be pitied is the heart unable or not willing to respond.

C. ESTELLE PEIRCE.

ALL ABOUT SALT.

WE never appreciate the advantages we possess. This may not strike you as an original remark, and indeed I do not reserve the right of translating it. Perhaps it might even be termed, with justice, a platitude, but it is remarkably true. I doubt whether it ever occurred to any one that it was nice to be able to breathe, unless asthma, or fog, or a fishbone, or a rope, or some other impediment to free respiration drew his attention to the fact. Living people can remember the time when no one placed any particular value upon water, which ranked with air as a thing too common, too necessary to be grateful for. The nearest pump or well supplied it in profusion, clear, sparkling, wholesome, free from "organic matter." In like manner we of the present generation think lightly enough of salt, and can hardly appreciate the distress which would ensue if it became scarce or dear, or if the progress of civilization poisoned it.

Salt is an essential constituent of the blood, from which it is constantly drawn by the secretions—you know how briny tears are—and therefore it must be supplied. It is the only mineral food of man. To understand the necessity for it, we must turn to the experience of travelers who have taken long journeys through regions where cannot be procured, and who are restricted all the while to a vegetable diet. For there is salt in all animal food, so that after a certain period of privation the freshest meat tastes strongly of it, and is exceedingly grateful in consequence. Explorers who have neglected to supply themselves with a sufficient stock of the mineral, speak of their yearning after it in terms which we should have fancied applicable to the want of water alone; and this is not merely due to the force of habit, for the natives show an equal appreciation of it, and the little children, in places where salt is rare, will eat it with the avidity which the boys and girls of other countries show with regard to sugar. All animals are likewise fond of it, and will lick a lump whenever they get the chance.

When we consider, in addition to this natural need of salt, how useful it is for the preservation of food which must be wasted without it; when we remember how dependent the poor especially are upon salt pork and fish, we can form some estimate of the hardness, nay, of the positive cruelty of the laws which should tax it so highly as to create an artificial scarcity.

Salt is found in vast masses more or less pure among rocks of all geological ages, but principally in the New Red Sandstone. The subterraneous streams percolating through the strata where it lies become impregnated with it, and form the brine springs from which the supply of salt has from earliest times been drawn.

In 1760, some persons trying for coal at Marbury, England, came upon the beds of rock salt from whence the brine springs issued, and ever since it has been excavated in blocks, by mining and blasting, like any other mineral. In some places the rock salt is found at great depths, in others near the surface—nay, it crops above it, for there is a hill of rock salt some hundreds of feet high in Spain; and the island of Ormuz, in the Persian Gulf, is composed of it. The finest salt, however, is obtained from the brine springs. The impregnated water is pumped up into a reservoir, and thence conveyed by pipes into the salt pans—large, shallow, iron receptacles, arranged with flues underneath them, so that sufficient heat may be applied to cause the water to pass off in steam, leaving the salt deposited. The more rapid the evaporation, the finer the quality: so to produce table salt the brine is caused actually to boil; while a temperature of a little over 100° is sufficient for the coarser kinds, which are used for the preservation of fish, etc., and are deposited in large crystals. When the water has evaporated, the salt is gathered out of the pans into vessels, where it is left awhile to drain, and then stored in apartments which are kept carefully dry. It is estimated that every pint of brine yields about six ounces of salt. Rock salt cannot be sold in blocks as it is quarried; even the best is mixed with too much foreign substance for that. So it is first dissolved in water, when whatever matter is insoluble sinks to the bottom. The liquid is then strained off, and treated like the other brine.

The famous Salsburg district, in Germany, includes the Hallein, Hallstadt, Berchtesgaden and other mines. The salt is a monopoly of the Austrian Government, and it brings in upwards of ten million of dollars a year. A visitor to the Berchtesgaden mine describes the manner in which the salt is obtained so clearly and concisely that I am tempted to quote his very words:

"If pure rock salt, or nearly so, it is merely quarried into blocks, and then conveyed to the entrance of the mine. If, however, it is imbedded in earth, clay, marl or gypsum, the process is more curious and complicated. Galleries are first cut through the limestone rock to the soft beds of salt, where a small chamber is excavated. One set of pipes is then conveyed into this chamber from above, and another set from the chamber to the foot of the mountain. These are closed at the bottom by a valve, which can be opened at pleasure, and are in communication with other pipes or tanks. When these preparations are complete, the water is turned on, and the chamber completely filled. The roof and sides gradually crumble and fall away, the salt dissolves in the water, and the earth and rubbish sink to the bottom.

The chamber is kept constantly full; and when the water becomes sufficiently impregnated with salt, which usually happens after a lapse of from three to six weeks, the valves are opened, and the lower set of pipes brought into use. The floor is then leveled and hardened, and other preparations being complete, another inundation follows. Every chamber is again and again used, until from some cause, as the partition between two chambers becoming weak, the room is rendered unsafe or valueless."

The brine, when drawn off, is treated as before described. Where briny springs or strata of rock salt are not available, the substance is obtained from the sea. This process is very simple, consisting merely in collecting the water in shallow pits dug on shore, and leaving it to evaporate. When this has taken place, the salt deposited is carried away to sheds, and there piled in heaps, to get rid of the chloride of potassium, which melts and runs off. The salt is then redissolved and crystallized.

There is another way of obtaining salt from the sea, namely, by a freezing process, when, on the ice being removed, a very strong brine is left, from which the salt is obtained by boiling. But such salt is impure, containing chlorides of aluminum, of calcium and of magnesium, and the use of it is therefore apt to give scorbutic diseases.

Besides its value as an article of food, and for the preservation of meat and fish, salt is an excellent manure, which is rather a curious fact, considering that it was a custom with particularly spiteful conquerors to raze cities, which they took at very great cost, to the ground, and then sow the earth with salt, to insure perpetual desolation. I do not know that the mineral is applied to many other purposes; there are people indeed who build their houses of rock salt, but that is in very dry countries, like Arabia, where there is little fear of a sudden shower dissolving their homes.

Salt mines are always objects of curiosity to strangers visiting their neighborhood, since the glittering nature of the walls and roofing causes them to be capable of brilliant effects. The mines of Wieliszka, in Poland, must be well worth seeing, some of the chambers being 300 feet high. In our country the large mines at Syracuse, N. Y., and Saginaw, Mich., are too well known to need description. L. H.

The Puzzler.

HISTORICAL ENIGMA.

I am composed of 28 letters:
My 5, 1, 11, 5, 7, 13, 21, 9, 12, 3, 3, 2, 5, 13, 16, an eminent composer of music.
My 6, 14, 23, 25, 22, 12, 3, 3, 24, 28 a Revolutionary general.
My 18, 27, 8, 10, 2, 1 the originator of vaccination.
My 26, 19, 17, 17 a modern writer of music.
My 15, 2, 8, 13, 20 a Virginia statesman.
My 5, 12, 3, 4, 3, 11, 9 a great astronomer.
My 18, 16, 15, 10, 17, 19, 22 a President of the United States.
My 6, 12, 13, 1, 6, 17, 19, 28 a noted abolitionist.
My 1, 6, 3, 24, 27 a Confederate general.
My 5, 7, 2, 14, 23, 2 a German poet.
My 17, 16, 5, 11, 3 a Union general.
My 17, 12, 8, 14, 25, 12, 10, 28, 25 a Mexican general.
My whole should urge us to serve God.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

As we are now entering upon the second volume of the Twenty-seventh year of the Rural New-Yorker, it would be well for the proprietors to say to subscribers and agents that a more prosperous time than the present has not been seen in this office for many a year.

Notwithstanding the cry of "hard times" which has been echoing through the land, the rural population seem to be able to take their paper. It may not be known to many of you that at the end of each year and half-year a newspaper changes a large number of its subscribers. Some old ones discontinue and their places are filled with new, so that while the list does not diminish in numbers, the changes frequently amount to many hundreds.

There were hundreds on our list whose subscriptions expired with the last number in June, and of these every one has *renewed* but *six*. This is something unprecedented in the annals of a newspaper office, and is the most flattering indication to the new management that their strenuous and laborious efforts to make a *good* paper are fully appreciated. With such encouragement as this, subscribers and agents may rest assured that nothing which time, labor and money can procure will hereafter be omitted to make the Rural still better than it is.

The Literary Departments will be kept up to their standards of excellence and morality, while the Practical Departments will continue to be made up of the most straightforward common sense which can be obtained. In those matters the aim will not be to make them so scientific that they may not be readily understood by every one; but it will be our constant endeavor to publish that which is *absolutely correct*. Now, all that is needed is for each subscriber to get another and our list will at once be doubled.

News of the Week.

HOME NEWS PARAGRAPHS.

The series of races in the International Regatta at Philadelphia have been inaugurated by a four-oared race between the Atlantas, Columbias, Beaverwycks and Vespers. The Atlantas and Columbias won the heats, and are, accordingly, candidates for final honors. The single-scull heats were won by Akerman and Courtney.

Fish of all kinds is very scarce and bring prices high in the New York markets.

The Republican (N. Y.) State Convention have nominated E. D. Morgan for Governor and S. S. Rogers for Lieut. Governor. Mr. Morgan was nominated on the first ballot. The convention was held at Saratoga Springs.

Clouds of grasshoppers are flying over Kansas in a southerly direction.

The mint in San Francisco coined in July $4,606,000, the most ever done in a month.

The remarkable bird-track slab uncovered at Turner's Falls, Mass., measures 118 feet square, and contains eight large tracks going in one direction, and nine in another. The slab will be taken to Yale College.

The new 4½ per cent. Government Loan is successful.

Heavy fighting is reported at a point north of the Black Hills. Losses large on both sides. Results favorable to the troops. Report not, however, confirmed.

Reduction of coinage at the Mints is reported.

Jos. R. Underwood, ex-U. S. Senator from Kentucky, is dead.

The English catalogue at the Exhibition has been generally commended for its completeness. There is one omission: the huge rats in the Main Building, which are supposed to have been imported with the British exhibits. Possibly they came from Norway; evidently they are not home-bred; undoubtedly they would, if introduced, make the international dog show still livelier.

Twenty thousand citizens of New Jersey celebrated Jersey Day at the Centennial.

The Grangers' estimate of the surplus wheat in California this season is 600,000 tons.

Later intelligence reports Yates as having won the single-sculls, and the Atlantas as claiming the four-oared championship at Philadelphia.

A grand tournament is being arranged by the young men of Richmond, Va., to be held at the fair grounds next month, for the benefit of the Lee monument fund.

Georgia has forty cotton mills in successful operation, running full time, and paying handsome dividends.

The Blackfeet in Canada give Sitting Bull the cold shoulder when he entreats them to join him in his warlike enterprises. With characteristic insolence he threatens them with severe punishment as soon as he has finished with the Americans. The Indian subjects of the Dominion have always been treated as subjects and not as enemies or independent tribes. It is hard to drag them into a war. Our Government has issued elaborate instructions to the Sioux Commission. It might have added one clause: Study the consistent Indian policy of the Canadians.

The tramp as a tramp is a horrible nuisance, but the tramp as a train-wrecker is a devil incarnate. The dastardly attempt to wreck an express train near Rochester amply justifies the stern measures which the New York Central Railroad has taken to protect its line. Other railroad corporations ought to be quite as wary.

The coal combination existing between the large coal producing companies has been ruptured, and the article is expected to decline largely in price.

The Summer school of natural history of the late Prof. Agassiz on Penikese Island having been abandoned, the property has reverted to Mr. John Anderson. He proposes to make it his Summer residence again.

Under instructions from the Attorney-General, all pending whisky prosecutions are to be taken up and disposed of at the next terms of courts having them in charge. There are a number of persons under indictment who have not yet been put on trial. These are to be arraigned as soon as possible. In the cases of those who have pleaded guilty, District-Attorneys will be instructed to move for sentence.

The instructions to the Sioux Commission, appointed under the recent act of Congress, relate the provisions of the act, after which the letter of instruction calls attention to the fact that Congress has expressed its determination to appropriate nothing further for the subsistence of the Sioux Indians unless they shall agree,

First: To relinquish all right and claim to any country outside the boundaries of the permanent reservation established by the treaty of 1868.

Second: To relinquish all right and claim to so much of their said permanent reservation as lies west of the 103d meridian of longitude.

Third: To grant a right of way over the permanent reservation to that part thereof which lies west of the 103 meridian of longitude, for wagon and other roads, from convenient and accessible points on the Missouri River, not exceeding three in number.

Fourth: To receive all such supplies as are provided for by said act and by said treaty of 1868, at such points and places on their said reservation, and in the vicinity of the Missouri River, as the President may designate.

Fifth: To enter into such agreement or arrangement with the President of the United States as shall be calculated and designed to enable said Indians to become self-supporting.

The following order was sent to nearly all Indian agencies by the Indian Commissioner:

Washington, D. C., Aug. 22, 1876.

Sir: You are advised that all sales of arms or ammunition to either whites or Indians by parties holding license as Indian traders issued by this office must be stopped instantly. You will promptly notify your traders, and will be vigilant in seeing that no violation of this order is allowed. If any instance of such violation occurs, you will revoke the license of the offending party, and report the case to this office for further action.

A case of yellow fever is reported from Boston.

An interesting and valuable case of what is called hydrophobia has occurred at St. Louis. Miss Mary E. Cruthis was bitten by a large Newfoundland dog about a year ago. The abrasion of the cuticle was very slight. Eighteen days after the bite the patient exhibited all the symptoms of hydrophobia, except frothing at the mouth. After an illness of a fortnight she recovered, seeming to be entirely well; but last week the attack was renewed, and at the last report Miss Cruthis was at the point of death.

It is not often that an actor is also a scientific scholar and an orator. Mr. Henry Edwards of the California Theater, San Francisco, has shown himself to be all of these—having delivered, at the opening of the Eleventh Industrial Exhibition of the Mechanics' Institute—at Wade's Opera House in that city, on the 8th inst.—an oration on "Iron, and its Relations to Civilization," which is fraught with learning, practical ideas and a broad appreciation of a great subject, and which is expressed with the true eloquence of earnestness and simplicity. The most ringing passages in the oration are those descriptive of the multifarious uses of iron, the sad condition which the world would lapse into without it, and the future that awaits mankind in the further development of its utility.

The main building of the Soldiers' Orphans' School at Phillipsburg, Beaver County, 25 miles below Pittsburgh, on the Ohio River, has been totally destroyed by fire. The loss is estimated at $20,000; partially insured. The origin of the fire is unknown.

Large fires are reported in the woods around Andover, Mass.

The union of the two great branches of Episcopal Methodism in the United States, which is foreshadowed in the address of the joint Board of Commissioners, is one great religious event of the Centennial year.

The steamship Erie has arrived in New York with a large importation of sheep from England. There were thirty-five Lord Walsingham Southdowns, twenty Cotswolds from the Royal Agricultural College, twenty Oxfords and fifty Berkshires. The Oxfords and Berkshires are the property of T. S. Cooper, the Pennsylvania breeder, and the others are for exhibition in Philadelphia.

The wharves and bulkheads in the neighborhood of the towers of the East River bridge were thronged on Aug. 25 with people eager to witness the first passage of a human being from Brooklyn to New York by the new route. At 1:20 a large flag, 30x20 feet, was hoisted on the Brooklyn tower, and a few minutes later another was displayed from the tower upon the New York side of the river. In the mean time everything was put in readiness on the towers and piers for the attempt, and at 1:25 Master Mechanic E. F. Farrington, the person who was to make the trip, took his seat in the "boatswain's chair," which was made fast to the "traveler rope." This chair was a board two feet long by ten inches wide. It was hollowed out in the middle so as to make a better seat, and in each corner was a hole through which a half-inch rope, four feet long, passed upward. Knots on the ends of these four ropes kept them from slipping through the holes, and supported the board. The ropes were tied together at their upper ends, and were made fast to the "traveler rope." The start was made from Brooklyn. Chief Assistant-Engineer Martin standing near the front and on the top of the anchorage pier, controlled the running of the engine in the yard below by signals with a red flag which he held in his hand. He regulated his signals to the man in charge of the engine, by those which he received from the towers and New York anchorage, made by men stationed on them for the purpose. The starting signal was given at exactly 1¾ o'clock, and in another second Mr. Farrington was swinging over the tops of the houses between the anchor pier and the tower. Hearty cheers went up from those assembled below. When about half way between the anchor pier and the Brooklyn tower, Mr. Farrington raised himself from a sitting to a standing position in the chair, and taking off his hat waved it to the people who were cheering him. The first part of his journey took three and one-half minutes, and was concluded amid the enthusiastic cheers of all beholders. Its successful termination was announced by the firing of a gun on the New York bulkhead. Mr. Farrington was received upon the tower with congratulations and expressions of admiration. The workmen moved the chair over to the river front of the tower, and when it was again in readiness Mr. Farrington embarked once more, and amid the good wishes and hand-clapping of those on the tower, he was launched into the space between the piers over the river. His appearance was the signal for everything in the shape of a steamboat to make all the noise in its power. The shrieks of the whistles and shouts of the spectators were deafening even to persons at the great height of the summits of the towers, and Mr. Farrington waved his hat again and again in reply to them. The trip between the towers occupied six and one-half minutes, and the reception of the courageous traveler upon the New York tower was more enthusiastic, if possible, than on the Brooklyn tower, while the people upon the wharves joined in the vociferous welcoming. In a few seconds the third stage of the journey (from the New York tower to the anchor pier) was begun. This occupied about the same time as the first stage, and was equally successful. Although it was practically certain that the rope would support a much greater strain, as it must, or it would be useless, it was necessary that some one should go out on it, and the master mechanic thought it best that he should prove himself willing to do a thing which he will soon call upon his men to do. His trip gives courage to the men, proving to them that it is without any real danger.

A quantity of trees and ferns were sold at auction, recently, by Young & Elliott, N. Y. About 3,000 plants from Dallas Bros., Bridgeport, Conn., brought fair prices. A large Adiantum Farleyense sold for $27, and a Latania Borbonica, 14 feet high, for $55.

The heaviest rain known in Wheeling, W. Va., for several years, fell on the night of Aug. 24. The houses on Main St. were flooded, causing an immense amount of damage to merchandise in cellars. Bridges in the southern part of the city were carried away and many corn fields seriously damaged.

Eight hundred ounces of gold dust arrived in Cheyenne, Aug. 25, from the Black Hills. A solid piece of quartz was consigned to the Pacific coast for exhibition. It bristles all over with pure gold. The piece weighs about 25 pounds and it is estimatee contains $100 in gold. This is from the Alpha mines. The telegraph line, which has been making slow progress, owing to the absence of an escort for the working parties, is now making headway. All the poles are set to Hot Creek, 50 miles beyond Laramie, and the work of stringing the wire has begun. The first communication over it was sent on the night of Aug. 24 from Platte River. The Black Hills Pioneer, published at Deadwood, gives very encouraging news in regard to the gold prospects in and about the Black Hills.

FOREIGN NOTES.

Intelligence received from Belgrade announces that the war party have finally obtained the ascendancy. Besides dispatching Col. Montverde to Belgrade, urging the continuance of the war, Gen. Tchernayeff sent Prince Milan dispatches, undertaking to regain lost positions, to drive the Turks completely out of Servia and to carry the war into Turkish territory. He also formally protested against Prince Milan's pacific leanings. The Servian ministers supporting Gen. Tchernayeff, the Prince at length yielded and ordered the hostilities to continue. Both parties claim victories before Alexinatz.

The King of Dahomey again threatens to kill all the English in his kingdom.

It is said the Prince Imperial of Austria will make a two years' visit to this country.

It is officially announced that the Servian troops under Gen. Horvatovich recaptured Gurgusovatz and occupied Tresibaba on Aug. 23d.

The officers implicated in the murder of the foreign consuls have been formally degraded before the public, and salutes were exchanged between the forts and the foreign men-of-war in the harbor of Salonica.

A special dispatch from the Bucharest correspondent of the Daily News, who accompanied Mr. Schuyler in his tour of investigation, says Mr. Baring's report of 60 villages burned and 12,000 persons killed by the Turks in Bulgaria does not include the outrages committed in the district north of the Balkans nor in the district of Sophia. Forty villages were burged north of the Balkans and 70 south. Mr. Schuyler has not yet completed his investigation; but he estimates the number of the killed at 60,000 in the district of Philippopolis alone. The regular troops are more cruel than the Bashi-Bazouks. No doubt the massacres were committed with the sanction of the authorities. Outrages continue to occur.

The Bishop of Lincoln is of opinion that the Almighty ought to be especially invoked in behalf of Servia against the Turks, and has issued a prayer for his clergy in which the deliverance of our fellow Christians and the Eastern churches is asked for.

London is now supplied with "Marseilles butter." It is produced at a large stearine candle factory in Marseilles, equals in appearance the finest Epping or Dorset, and keeps well.

The elections of Presidents of the Councils-General of France have resulted in the choice of 5 Constitutionalists, 4 Monarchists, and 39 Republicans. The Republicans have gained seven seats.

Advices from Madrid state that three Spanish gunboats are being sent to Chinese waters at the request of the Spanish representative at Peking. This step is either taken to support the Spanish demand for the restitution of a vessel stranded at Formosa, or for fear of complications arising from the recent attack on the French missionary chapel at Ning-Kone-Foo.

Prince Milan wants peace. He admits that he is beaten, but holds that the military honor of Servia has been upheld by the six days' fighting at Alexinatz. This avowal may end, amid gloom and disaster, the campaign begun so boastfully eight weeks ago.

There are rumors that a political conspiracy has been discovered in Pampeluna, Spain. It is stated that arrests have been made. The garrisons of the Upper Navarre have been re-enforced.

Soundings for the Channel tunnel to connect England and France will be finished by the end of August. The engineers report that the results are very satisfactory.

INQUIRIES FOR ADVERTISERS.

[OWING to the many inquiries from subscribers concerning things that have a commercial value, and are offered for sale through the medium of newspaper advertising, we have deemed it for the best interest of all concerned, to classify our "Answers to Correspondents," so that each inquiry will appear under its appropriate head, either in "Inquiries for Advertisers," or "Answers to Correspondents." This, we believe, will enable advertisers to more effectually comprehend the wants of our subscribers, and will enable us to make our advertising columns what they should be—a true reflection of our readers' wants. This department will be edited carefully, it being our aim to use it in the interest of both advertisers and readers, and we shall not hesitate to give our reasons for excluding bad or doubtful advertisements; and, such other matter as will be of legitimate interest. At the same time it must be understood that such inquiries as may appear must appeal to the advertiser himself for answer. The advertisement should answer the want and the want is indicative of its need.]

JAMES BROWN, Otsego Co., N. Y., and several others, want to know the address of a reliable dealer in game fowls.

R. H. B., Vermont, wants a good swivel plow. We refer him to the advertisement of Everett & Small, in this issue.

JOHN STEWART, Bergen Co., N. J., wants a plow for low muck ground that will scour easy.

R. C., Liverpool, Ohio, wants the address of some responsible dealers in fine poultry, as he is about to start a large hennery.

H. M., Allegany Co., N. Y., wants to know where Osage Orange Seeds can be obtained, cheap and reliable.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 26, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	71,600	Molasses	—
Whisky	2,046	Rice, bbls	208
Corn meal, bbls	3,077	Cut meats, pkgs	7,335
Corn meal, bags	650	Lard, pkgs	3,550
Wheat, bush	179,750	Tobacco, hhds	3,055
Corn, bush	411,200	do. pkgs	1,385
Oats, bush	107,750	Butter, pkgs	20,872
Rye, bush	800	Cheese, bxs	69,856
Malt, bush	31,025	Cotton, bales	5,031
Barley, bush	500	Rosin	2,363
Beans, bbls	5,042	Spts. turp., bbls	2,452
Grass seed, bush	3,925	Dried fruits, pkgs	425
Beef, pkgs	1,489	Eggs, bbls	17,004
Wool, bales	1,926	Peanuts, bags	553
Hops, bales	455	Leather, sides	69,980
Pork, bbls	1,522	Sugar, hhds	—
Tallow	2,370	Oil cake	6,355

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEESWAX.—Prices are a trifle easier, with a slow trade; sales at 31c. for Western and 31c. for Southern.

BEANS AND PEAS.—Exports of beans past week, 1,300 bbls.; since Jan. 1st, 41,911 do.; same time last year, 19,807 do. Exports of peas past week, 1,488 bu.; since Jan. 1st, 472,514 do.; same time last year, 202,966. The demand for medium beans is light; the inquiry is somewhat larger, but buyers, finding higher prices for choice, will not operate freely. The export demand for marrows has revived, and last week's figures are quite strong. White kidneys and best beans have pretty well run out of stock. Choice red kidneys remain steady; poor, uneven tail lots hard to sell. Further crop reports point to a lighter yield this season. Lima and bush beans nominal. Canadian peas dull at 97c. for bulk and bond, and $1.11 ₱ bbl, free. Green peas being brisk at $1,10@1.15.

Beans—Prime pea, $1.2@1.30 fair to good, $1.05@$1.10; prime mediums, $1.0@1.10; fair to good, 95@90c.; poor, 10@85c.; prime marrows, $1.45@1.50; fair to good, $1.20@1.30; prime white kidneys, $1.40@1.50; other, $1.15@1.25; prime red kidney, $1.40@1.45; other, $1.15@1.25; Lima (Cal.), $2.75@3.00. Black beans, $3.75@4.00.

BROOM CORN is neglected and nominal; short, green brush and hurl, 6@8c.; green medium at 5@6c.; red and red tipped, 3@4c.

BUTTER.—State butter has ruled very strong throughout the week. At one time sellers were tempted to demand daily advances. The condition of the market during light supplies and fine, cool weather, would have warranted holders in running up figures; but we are rather close to full for the market to be tampered with, and the present feeling in the trade is to not strain quotations beyond what we advance them this week. The feature of the week is the heavy demand for export use. About all of the old stock of Western has been taken out of market. The exports for the fortnight ending today, are nearly 20,000 pkgs. This is a style of trade that has not favored our market for a very long period. It is not unlikely that low grades of State will find a similar outlet if prices can be made to suit. Some lines of Welsh have been already taken at 25c.; but this is above the grade or view of the general export operators. Falls are not running uniformly fine, and only selections will bring the extreme, but more could be used at full prices. Some of the interior dairy districts now complain of drought, but they have had a long making season, and a good fall yield must not be despaired of yet. Chautauqua Co. is sending some fine, small, fresh-made invoices. Western shippers should not omit cloth in top of firkins. Prime packed Western firkins, 19@20c, for good.

We quote:—Choice pails, 29@30c; prime, 25@27c.; poor to good, 15@24c.; creamery pails, choice, 30@31c.; good, 28@29c.; sweet cream pails, 25@26c. State firkins, choice, 27@28c; fair to good, 24@26c.; do. half firkin tubs, choice, 27@28c.; fair to prime, 23@26c.; do, Welsh tubs, choice, 26@27c.; other, 22@24c.; Western creamery, choice, 25@26c.; other, 25@27c.; do. firkins, best, 20@21c.; other, 14@17c.; dairy tubs, choice, 21@23c.; other, 14@16c.; factory choice, 19@21c.; other, 14@16c.

CHEESE.—There has been a stronger export demand for fancy factories, and this grade is a trifle better to price, most sales early were at 9½c. closing at 9¾c. The other grades are without change, the best being but little wanted.

Fancy factory, 9¼@9½c.; fine, 9@9¼c.; good and prime, 8@8¾c.; fair, 7@7½c.; do. half-skimmed 5@6c., do. skimmed, 3@4c. State farm dairy, fancy, 8@8½c.; good to prime, 7@8c.; fair and good, 6@7c. Western factory, good and prime, 7@8c; fair lots, 6@7c.; do. cheddar, choice, 8c; do flat, choice, 8@8¼c. Exports past week, 14,900 boxes.

COTTON.—There has been a fair export demand at easier prices. The closing prices are:

Quoted at 11 29-32@11 15-16c. for August; 11 25-32@11 13-16c. for September; 11 17-32@11 9-16c. for October; 11 13-32@11 7-16c. for November; 11 13-32@11 7-16c. for December; 11 17-32@11 9-16c. for January; 11 11-16@11 23-32c. for February; 11 27-32@12¼c. for March; 12 1-32@12 1-16c. for April; 12 7-32@12¾c. for May; 12¾@12 13-32c. for June; 12¾@12 17-32 for July.

Quotations for spot cotton, based on American standard of classification:

Strict ordinary	10	Middling	11¼

DRIED FRUITS.—There is a light business in job lots of apples at easy prices, quoted at 4@4c. for new Southern quarters. New peeled peaches have sold at 13@15c. as to quality.

Apples—State, sliced, 8@8¼c.; do., quarters, 7¾@8¼c.; southern sliced, 7¾@8c., fancy do. at 10¾@11¾c.; do., new quarters at 6½c. Blackberries, 7@7½c. Peeled peaches, new, nominally 13@15c., as to quality; unpeeled peaches, new, nominal. Plums at 13@15c. Raspberries, 24c. Cherries, 14¾@15c.

EGGS.—During the past week the market lost some of its late blue tinge, and though prices have not advanced to ordinary summer firmness, a revived inquiry and better holding weather have given sellers more confidence. The surplus of Western have been marked down. State and New Jersey are wanted. Lots of long collection, however, will not bring the highest rates.

Near points, 17@20a., State and Penn., 17@18c.; Western, prime, 15@15¾c.; ac. other, 14@14¾c.; Canadian, 14@15¾c.

ESSENTIAL OILS.—The following are the latest revised quotations:

Oil peppermint, glass, $3.75; do. tin, $2.90; spearmint, glass, $3.50; do. tin, $2.75; wintergreen, $2.80; sassafras 35c.

FEATHERS.—There has been no movement for many weeks. We quote prime live Western geese, 50@55c.; do. do., 30@40c.

FLOUR.—The export trade has been moderate only through the week, and larger supplies coming to hand have forced easier prices.

For poor to very choice superfine State, $3.50@4.95; $4.80@4.60 for very common to fair extra do; $4.70@4.75 for good extra do.; $4.80@5.15 for fancy do., and $5.30@5.40 for very choice extra; $3.50@4.25 for superfine Michigan Indiana, Iowa, &c.; $4.30@4.55 for shipping extra do., the inside price for interior, and $4.60@5.00 for choice to very fancy extra do.; good to choice white wheat extras at $5.00@5.50 fancy do. $5.75@6.25; winter wheat, good to choice family city mill extras, $6.00@7.00, round-hoop Ohio, $4.50@4.85, and trade brands of do. at $5.00@6.75; St. Louis, $4.60@5.90 for common to fair extra, and $6.15@6.25 for good to very choice; Minnesota "straight" at $4.60@7.10, and patent at $6.40@9.40; unsound stock at from $4.25@5.60; city mills extra at $5.50@5.90; No. 2 at $2.50@3.25. Corn meal—Yellow Western, Jersey and Pennsylvania, $2.50@2.55.

FRESH FRUITS.—Delaware peaches continue to run fine in quality, and though receipts are moderate, sellers have to humor buyers in the plain fruit or that which arrives late in the day. A few New New Jersey run fine, but the dry weather has pinched the crop pretty badly. Apples are extremely cheap, sellers feeling the surplus of even fine fruit in the absence of a shipping demand. Pears are in rather full supply but it is early for free sales. Bartletts thus far have run poor, and where one barrel brings $6 or $7, a half dozen will not exceed the range of $3 or $5. Southern Bartletts not wanted. Crab apples are a neglected item; in fact, they have been for several seasons past. California fruit is not favoring producers this end of the season; almost all of the last arrival of plums and pears was in bad order. Grapes are abundant and low. Plums are improving in quality; poor ones hard to sell. Melons of all kinds low but salable. We quote:

Apples, best, ₱ bbl., $1@1.50; do. common, 50@75c. Peaches, Delaware, fancy, ₱ basket, $1@1.50; fair to good, 50@ 75c.; crates, 75c.@$1.50; N. J., ordinary, baskets, 50@75c.; a few fancy, $1.25@1.50. New Jersey Bartletts, ₱ bbl., fancy, $7, other, $3@5; Southern, $3@6; other pear, ₱ box, 50@$1; cooking pears, $1.50@2; California B. Clairgeau, ₱ box, $1. California plums, ₱ box, choice, $3@4; good, $2@3; poor, $1@2. Grapes—Delaware, ₱ lb., 8@10c.; Martha, 12@15c.; Concord, 5@7c.; Hartford, 5@6. Whortleberries, ₱ bush., $1.50@1.75. Nutmeg melons, ₱ bbl., 50c@$1. Watermelons, N. J. and Baltimore, ₱ 100, $8@16. Peanuts dull at $1.40@1.60 for prime to fancy Virginia; common, $1@1.30.

GRAIN.—Although the receipts of wheat are very small, with a light export demand, prices are unsettled, favoring the buyer; the closing transactions are of No 2 Milwaukee spring, steamer grade, at 99c. @$1.03 for ordinary to about good; No. 2 Chicago spring, steamer, at 9a.@1; Milwaukee spring, $1.02; new No. 2 red Western, $1.15; very good old amber Michigan, about, $1.15; prime new red Western, for shipment, $1.15. Rye at 65@70c. for No. 2 Western. Barley is quet; a car lot of new four-rowed State sold at 75c.; for new crop late September arrivals 90c. offered and up to the mark. Corn has a fair export demand at steady prices; latest sales 51@58c for steamer to very choice and unmixed mixed Western, chiefly at 57@58c for good to choice sail, about; steamer ungraded, 55@56½c. for about fair to prime afloat, mainly at 56c.; 50@56c. for hot, and 52@55c. for warm; yellow Western at 60@61c., yellow Southern, 59@60c. white do. on dock, 59c.; New York steamer yellow 59c., New York No. 1, 58c. Oats are in active demand and firm in price; latest sales of No. 2 Chicago quoted at 30@31c. for about fair to prime; new white Western, 33@42½c.; No. 2 Milwaukee fair 38c.; mixed state in store, 40@41½c; new mixed Western, poor to good, 33@38c.; white State, 42@45c.; new crop white Pennsylvania, 38c.

HAY AND STRAW.—Supplies are liberal, but demand is good and prices firm.

Sale hay is quoted:—Shipping, 60c.; retail qualities 70@90c.; clover, 55@60c.; salt, 55@60c. Straw is quoted at 65@75c. for long rye; 50@55c. for short rye; 40@45c. for oat.

Exports past week 310 bales; since Jan. 1st, 32,678 do., same time last year, 30,725 do.

HIGHWINES.—Higher; held at $1.14@1.14½.

HOPS.—There are small sales of the new crop at 25@35c., according to quality. The general market is moderately active.

N. Y. State, 18@20c.; Eastern, 8@15c.; Wisconsins, 8@15c; Yearlings, 8@10c.; Olds, all growths, 4@6c.; California (nominal), 15@18c. ₱ lb.

POULTRY AND GAME.—The quality of dressed is still variable, and it is difficult to quote regular prices for fowls. Chickens doing fairly. We quote:

Dry-picked chickens, 20@24c; scalded, 17@21c.; dry-picked fowls, 15@17c.; scalded, 13@15c.; turkeys, 13@17c. Live poultry is arriving heavily enough to keep prices tame. Still, cheap figures send a good deal into town. We quote spring chicks, near points, 17@18c.; Western, 11@16c.

Fowls, N. J., ₱ lb 14@15c.; do. Western, 12@13c. Roosters, 7@8½; Turkeys, N. J. 13@15c.; do. Western, 12@14c; Ducks, N. J., pair, 75c.@$1; do Western, 65@70c.; Geese, N. J., $1.75@2.25; do. Western, 1.25@1.50.

Grouse will be quotable next week. Woodcock and pigeons unchanged. Stall-fed pigeons, $1.25@1.75; do. squab, 87c@$1; tame live pigeons, ₱ pair, 30c. State woodcock, pair, 90c.@$1; Western, 80@90c.

PROVISIONS.—The market generally has been very much depressed and lower. Mess pork quoted at $16.75 for spot, September and October. Dressed hogs at 7½@8½c. Bacon at 9½c. for long clear. Western steam lard at $10.95 for spot, August and September deliveries, and $ 0 42½ for October. Steamine at 13½c. for prime Western tierced. Tallow at 8¾@8 7-16c for prime. Beef hams at $29 for Western. Beef at $9@10 for plain mess, $10@11 for extra mess, $11@12 for packet, the outside prices for small lots choice. Tierced quoted nominal for prime mess and India mess. City extra India mess at $18@19.

SUNDRIES.—Glycerine, ₱ lb., Southern, $1.15@1.30; Seneca root, 75c. Cider, ordinary to refined, 14@18c. ₱ gal.; cider vinegar, 18@25c. Sheep skins clipped, 30@35c.; do. unclipped, 50c.@$1; lamb skins, 60@65c.

TOBACCO.—Export trade is fairly active and prices are well maintained.

KENTUCKY LEAF—NEW CROP.

	Light.	Heavy.
Common logs	6 @ 6¼	7 @ 8
Good logs	7½@ 9	8½@ 9½
Low leaf	9½@10½	10 @11
Medium leaf	11 @12	12 @13½
Good leaf	13 @14	14½@15½

SEEDLEAF—CROP OF 1875.

New England fine seconds	12½@14
Fine fillers	6 @ 7½
Seconds and fillers, shipping	5½@ 7
Pennsylvania assorted lots	14 @25
Ohio assorted lots	5½@ 8
Wisconsin assorted lots	3 @ 5

VEGETABLES.—The market is low for potatoes and Western which have been our dependence for the past few weeks, now have to divide up with State and nearer points. Sweets are tending lower. Garden stuff generally favors buyers.

We quote potatoes, ₱ bbl., $2.50@3.; sweet do., $3.50@4. Green corn, ₱ 100, 62@$1. Long Island Tomatoes, ₱ bush., 25@37c.; New Jersey, do., 50c. Marrow squash, bbl., $1.00; Wax beans, bag, $1@1.25; Cucumbers, L. I., ₱ 100, 30c.; Turnips, Russia, ₱ bbl., $1.25@1.75. Cabbages, L. I., $3@5 ₱ 100. Onions, $1@1.50 ₱ bbl. Lima beans, ₱ bag, $1.00@1.25. Egg plant, ₱ bbl. 50@9.

WOOL.—There has been a liberal inquiry from manufacturers and prices are very strong at an advance. X and XX Ohio fleeces quoted at 40@42c.; Michigan, 33½c.; Eastern Texas, 17@20½c.; Western Texas, 15@23c.

ROCHESTER, Aug. 26.—Flour market active; spring, $6.50; amber winter, $6.75; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.00. Wheat lower. Milwaukee club, $1.10@1.18; amber winter, $1.00@1.05; white winter, $1.05@1.15. Oats, nominal at 30@33c. Corn quiet at 57@62c. Corn meal, $1.25@1.50. Butter, 18@20c. Cheese, 10@12c. Eggs, 14@15c. Lard, 11½@12½c. Apples bu., 50@60c. Potatoes, bu., 60@65c. Beans, ₱ bu., 70c.@$1. Mess pork, $21.00. Wool, 20@25c. Hay, $8@11 straw $6@8 Timothy seed, $2.75@3.50; clover, $6.25@10. Mill feed strong at $16 for shorts, $18 for shipstuffs and $20 for middlings. Railroad Freights—Flour to Boston, 40c. ₱ bbl.; to New York, 30c.; to Albany, 25c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Aug. 26, 1876.

THE tone of the market this week is improved and trade is more brisk than for several weeks past. The cool weather and the greater safety in shipping have doubtless had their influence in rendering trade more active. The prevailing drought and the shortening of the crop of cheese over a wide extent of country is now being considered, and is one of the elements which must enter into the trade. About 500 boxes of farm dairy cheese were on delivery, and sales were made at from 7 to 9c. the bulk going at 8¾ to 8¾c.

The offerings from factories were large, reaching 13,000 boxes and upward, about 10,000 of which changed hands. The sales ranged from 9 to 10¼c., the latter being an extreme price. The bulk of sales may be quoted at from 9¾ to 9¾c.

We have recent advices from abroad. Our London correspondent says American cheese sells well and the stocks at the wharves are about clear. Imported are firm. New English cheese of good condition is in demand, and Dutch cheese is firm. We give quotations:

American, extra fine, 51@55c., fine, 42@53s.; good, 46@50s.; secondary, 36@41s. English cheddar, 76@83s.; Wiltshire double, 61@72s.; Cheshire medium, 50@58s.; fine, 66@70s.; second, 56@58s. Dutch cheese—Edams, 54@58s.; Gondas, 56@59s.; Derby shape, 51@53s.

The butter market steadily advances, with a prospect of still higher rates. The prices are given as follows:

Channels 130@134s.; Corks, 132s.; Jersey, 101@114s.; Ilmericks, 118s.; Do sets, 120s.; Friesland, 130@132s.; Normandy, extra, 114s.; American and Canadian, 100@110s. Oleomargarine (artificial butter) sells at from 90 to 100s. ₱ cwt., according to quality.

LIVE STOCK MARKETS.

NEW YORK, Aug. 26, 1876.

RECEIPTS OF LIVE STOCK.

	Beeves	Cows	Calves	Sheep & Lambs	Hogs
Sixtieth St.	3,893	21	1,766	10,470	000
Forty-Eighth St.	36	35	302	3,128	000
Fortieth St.	000	00	000	000	10,152
Harsimus Cove	4,787	16	28	11,683	7,352

" last week	9,914	86	1,997	20,303	20,854

BEEVES.—Trade on Monday last returned to the same condition as it had been on the previous Mondays as to facility of sales, but no improvement on last Friday's rates. The herds to hand ranged from poor to good, being generally coarse grass-fed cattle. Prices were 6¾@10¼c. ₱ lb., with 1 head sold at retail at 11c.; weights, scant 5400 lbs. Wednesday, trade fair at 7¼@10¾c.; weights, 1,200@1,400 lbs. Thursday, trade small at 7¼@10c.; weights, 1,350@1,450 lbs. Friday, the markets closed weak at 7@10¼c. weights, 6¼@8¼ cwt. From 5,000 lbs., net have been allowed general sales on 55@56 lbs. net. Spanish herds direct from the Plains sold at 6¾@8¾c. ₱ lb., grass-fed native steers, 7¼@8¾c.; part corn-fed do, 9¾@10c, grade do., 10¼@11c. Bulls, live weight, sold at $3.75@3.50 ₱ cwt. Oxen sold at 7¼@8¾c. ₱ lb.

Comparative Rates.

Quality.	This week. Cents.	Last week. Cents.
Good	11 @	11 @
Fair	10¼@10¾	10¼@10¾
Poor	9¾@10¼	9¾@10¼
Poorest	9¼@ 9	9¼@ 9
Gen. selling rates	8 @ 9¾	8¼@ 9¼

MILCH COWS.—Trade slow, with a large proportion of the lots to hand unsold; quality generally inferior. Nine cows sold at $40@55 ₱ head. Eight cows at $50@65. Three cows at $65@69. Two cows at $70@72. One cow for $85.—Calves always included.

VEALS AND CALVES.—Coarse quality calves sold at 3¾@6c. ₱ lb., with a few head at 6¾@6¾c. ₱ lb. Grass-fed calves at $5@10 ₱ head. Smooth quality veals at 7@9c. Trade slow and the unsolds to hand not cleared off. Sheep to calves sold at 3½@6¾c. State veals at 8@9c; Pennsylvania do., 7@8¾c.; Jersey do., 7¾@9c.

SHEEP AND LAMBS.—Monday last sheep fell off in feeling and lambs improved about ½c. ₱ lb on all degrees of quality. Sheep sold at 4¾@5¾c. ₱ lb., and lambs at 5¾@7¾c.; mixed flocks, 5@6¾c. Wednesday, sheep 4@5¾c.; lambs, 5@7¾c., trade being fair, but not active. Thursday, trade small: sheep, 4@5¾c.; lambs, 5@7c. Friday, the markets closed weak: sheep, 4@5¾c.; lambs, 5@6¾c. Kentucky sheep sold at 4¾c.; Virginia do., 4¾@5¾c. State do., including mucks, 4@5¾c.; Ohio do, 4¾@5c.; Indiana do., 5c.; Pennsylvania do., 5¾@5¾c. ₱ lb., Canada lambs, 6¾@6¾c.; Jersey do., 7@7¾c.. Kentucky do., 6¾@6¾c.; Virginia do., 5@6c.; State do., 5@7c., ₱ lb.

HOGS.—One single deck of Ohio hogs, average live weight 222 lbs. ₱ head sold at 6¾@6¾c. ₱ lb. Trade in city dressed inactive on a light run; extreme range, 8¾@8¾c ₱ lb.

HORSE MARKET.—City trade easier in inferior quality horses. Valuable animals generally held on sale. Thirty poor quality light farmers horses sold at $55@70 ₱ head; 30 do., $50@75 ₱ head; 31 ordinary quality do., $100@125 ₱ head; 39 coarse quality heavy draft do., $125@200 ₱ head; 1 superior quality horse, $350; 1 pair of horses, $600. 17 roadsters, with moderate trotting action, but not warranted sound, $200@350 ₱ head; 2 pairs stylish carriage horses, $1,200@1,300 ₱ pair.

PERSONAL ITEMS.

GEORGE ELIOT'S father was a Dissenting clergyman.

COFFINS for birds, cats, dogs and other pets are sold in New York.

A CHINESE epicure affirms that rats' hams are perfectly delicious.

DANIEL WEBSTER'S old yacht, the Lapwing, is still afloat at Marshfield.

PRESIDENT ELIOT of Harvard College is yachting along the coast of eastern Maine.

A VERMONT jury now decide for the third time that larger beer is not intoxicating.

PROF. PETERS is now discovering planets and asteroids to order. Any more left, Professor?

N. B.—"Colonel Anthony" nominated for Governor of Kansas is not Susan B., it's her brother.

PICKLES, said to be superior to cucumbers, are put up in Florida from the pith of the palmetto roots.

A. S. ABELL, proprietor of the Baltimore Sun, is seventy years old, and is said to possess $10,000,000.

COLONEL VEST of Missouri, expects to be elected, provided, of course, there are no breeches in his party.

THE dory Centennial is safe on the other side. Now for the next seeker after fame at the risk of his life.

QUEEN ISABELLA, when leaving Paris for Spain, sent $1,000 to the Prefect of the Seine for the poor of the city.

SENATOR BAYARD received the honorary degree of LL.D. at the recent commencement of Delaware State College.

CHARLEY ROSS will be big enough to find himself one of these days, consolingly observes a New Orleans paper.

GEN. SICKLES, ex-Minister to Spain, has sold his establishment in Paris, preparatory to returning to America.

BOSTON CORBETT, the soldier who shot Wilkes Booth, the assassin of Lincoln, is now a hatter in Cleveland, Ohio.

THE Brooklyn Argus suggests that the reports of the atrocities in Bulgaria read like one of Morton's speeches.

MRS. W. H. F. LEE, daughter-in-law of the late General R. E. Lee, is reputed to be the handsomest lady in Virginia.

THE cable across the East River is one of the "sights" which Centennial visitors are expected to describe when they return.

EDITH MAY, the Survivor of the Mohawk disaster, is spoken of as "the most observed and handsomest lady" at White Sulphur Springs.

QUEEN VICTORIA'S speech said nothing so very gracefully that it is a pity she can't live forever and repeat the performance twice a year.

GEORGE W. SMALLEY is mentioned as a possible editor of the Tribune—after Mr. Reid steps down and out and the tall tower is struck by lightning.

RALPH WALDO EMERSON makes almost as much money from his apple-orchard, which he manages with rare ability, as he does from his books.

THE Hon. Joseph R. Underwood, ex-United States Senator from Kentucky, died at his residence in Bowling Green, yesterday, aged 86 years.

WHEN a Saratoga lady called her son to account because he had a golden hair on the lapel of his coat, he explained that his girl had put a head on him.

GEORGE H. LEWES writes very little now-a-days. Well, why should he, with a wife making $80,000 a year? If anybody can afford to be a philosopher, he can.

THE ice-cream and soda business is a little off, and thicker clothing for morning and evening is called for. But the warm weather isn't over, by any means.

THE aristocratic tastes of Newport sojourners were gratified the other day by the presence of five noblemen, who took part in a single figure of the German.

SOL SMITH RUSSELL, the comedian, who is playing with the Berger family, is to be married next month to a daughter of William L. Adams ("Oliver Optic") of Boston.

JOSEPH PITMAN, the last survivor of Napoleon's custodians at St. Helena, has died in England in his ninety-third year, having been a pensioner for full fifty years.

IT is said the Emperor William of Germany will have been seventy years in military life on New Year's Day, 1877. He entered the army before he was ten years old.

DEALERS in military equipments are not generally warlike men, and yet, in making out their bills for regimental outfits, they never hesitate to charge bayonets.

THE passion for croquet is increasing in the rural mind. Two Western New York girls, during the absence of materfamilias, sawed off the tops of their bedposts, for balls.

THE Italian Minister of Public Instruction, on the re-opening of the Chamber of Deputies, after the recess, will bring forward a bill establishing elementary education in Italy.

MISS MOLLIE C. MORTON, the Louisville belle, with whom the Grand Duke Alexis fell so madly in love, has gone and married J. B. C. Lucas, one of the rich Lucases of St. Louis.

THE heart of Gen. Butler leaps with joy at the thought that the American flag, which he manufactures, protected the Fenian prisioners. He believes in the protection which the flag affords, and that other protection which the nation affords his bunting.

OIL wells are so thick that, in some parts of Pennsylvania, it isn't safe for a stranger to venture forth alone after dark without a liberty pole strapped across his shoulders.

MR. G. W. SMALLEY, the London representative of the New York Tribune, and Mr. Halstead of the Cincinnati Commercial, are visiting in Springfield, the guests of Mr. Bowles.

PROF. HUXLEY reaches this country just in time to settle the controversy as to whether a mosquito dips its siphon into a Jerseyman for the purpose of extracting his blood or his applejack.

A LITTLE girl was asked what was the meaning of the word happy. She gave a very pretty answer, saying, "It is to feel as if you wanted to give up all your things to your little sister."

"How to Get Rid of a Cold" is being discussed by the country papers. Put a little nitro-glycerine up your nose, then hit it with a sledge hammer, and the cold will never trouble you again.

MONSIGNOR CAPEL, preaching lately at St. Alexander's Church, Bootle, on the confessional, said that he had never heard in confession the "least thing that might not be proclaimed on the housetops."

LA SPELTERINI, the adventurous woman who has been walking across the Niagara on a tight rope, is said to be something of a blue stocking, speaking five languages and reading Latin and Greek.

JUSTICE has recovered her eyesight at last. A lightning-rod man fell from a ladder in Laurel county the other day, and was so completely demolished that it is thought lightning must have struck him.

GRINNELL, Iowa, has hit upon a happy plan for the treatment of tramps. A gang of them were put to work on a new church, and ever since that they and their friends have given the place the grand good-by.

A CURIOUS book is about to be published. It was written by a Chinese mandarin, and records his impressions during a visit to England. Its title is, "Ah chin Le on the Civilization of the Western Barbarians."

THE Bostonian is not naturally a holy being, but he very justly flares up when he goes into a photograph gallery and is informed by the operator that in order to secure a good likeness he must first wash his face.

SERGEANT BATES has done a good many acts of daring bravery in his life-time; but we'll venture a new hat that he daren't walk into the rooms of the American Embassy at London and ask if "Mr. Munson Pierpont" is in.

WE have no doubt of it. Neuralgia in the faces and heads of women is largely on the increase, and the physicians say it is due to the inferior protection afforded by the mode in which women now cover their heads.

SANTANTA, the aged Kiowa chief, now confined in the Texas Penitentiary, was so overjoyed on hearing of the slaughter of Custer and his command that he begged to be allowed to go to the assistance of Sitting Bull, and could hardly conceal his rage when his request was denied.

A NEW LONDON vessel was recently boarded at sea by the Colorado beetle in such numbers as to necessitate a closing of the hatches. Upon being informed, however, that there were no potatoes on board, the bugs merely gave the captain a reprimand, and started out to wait for another vessel.

ACCORDING to a Louisville paper this is the way a Kentucky candidate for office greets a voter: "Howdy, howdy, howdy?" "Howdy?" "How do you do?" "Tollable." "How's all?" "Tollable." "Your folks well?" "Tollable: how's yourn?" "Tollable." "All for me, this time?" "Sorter tollable."

WHEN the last rose of summer
Is faded and gone,
And the blue-bottle hummer
Lies dead as a stone:
When the mud-bugs and slingers
Take umbrage and go;
Oh! tell us, why lingers
The wild mus-qui-to!

A MAINE Universalist minister, advertising for a lost pocket-book containing $8, said:—"The person who has it knows whose it is, because my name is in it, and if honest will return it. If not, he will, of course, keep it and accept my advice to use the money for the purpose of a stool of repentance that is charged with ignitible brimstone."

PHILADELPHIA people complain that the Thomas concerts are not well attended in that city. It is the fault of the Thomases themselves, then. We and our neighbors own four, of the ordinary woodshed variety, and when they give a concert at night every man within two miles of the house gets up and cries and swears, and wrings his hands and walks the floor, and we haven't kindled a fire this summer with anything but the strange bootjacks we pick up in the back yard every morning.—*Burlington Hawkeye.*

COLONEL H. C. BROCKMEYER, the Democratic nominee for Lieutenant-Governor of Missouri, had a classical education at Brown University; went west; lost his money by a bank failure; then for three years lived in a hut of his own building in the woods, supporting himself by shooting game; then learned the trade of a moulder, and, after saving $800, went back to his hut, bought a section of land and lived there for several years, at a cost of $12.50 a year. He is a master of six trades, and introduced smoking into the Senate of Missouri.

Implements and Machinery.

"THE VIBRATOR."

1,000 SOLD LAST SEASON
WITHOUT ONE FAILURE OR REJECTION.

This is the famous Threshing machine that has "swept the field" and created such a revolution in the trade, by its MATCHLESS GRAIN-SAVING AND TIME-SAVING principles.

THE ENORMOUS WASTAGE of grain, so *inevitable with other styles* of Threshers, can be SAVED by this Improved Machine, *sufficient, on every job, to more than pay all expenses* of threshing.

FLAX, TIMOTHY, MILLET, HUNGARIAN and like seeds, are threshed, separated, cleaned and saved, as easily and perfectly as Wheat, Oats, Rye or Barley.

AN EXTRA PRICE is usually paid for grain and seeds cleaned by this machine, for extra cleanliness.

IN THE WET GRAIN of 1875 these were substantially the ONLY MACHINES that could run with profit or economy, doing fast, thorough and perfect work, *when others utterly failed.*

All GRAIN, TIME and MONEY wasting complications, such as "Endless Aprons," "Raddles," "Beaters," "Pickers," etc., are *entirely dispensed with;* less than one-half the usual Gears, Belts, Boxes and Journals; easier managed; more durable; light running; no costly repairs; no dust; no "litterings" to clean up; not troubled by adverse winds rain or storms.

FARMERS and GRAIN RAISERS who are *posted* in the large saving made by it, will not employ inferior and wasteful machines, but will *insist* on this improved Thresher doing their work.

FOUR SIZES made for 6, 8, 10 and 12 Horse Powers. Also a specialty of SEPARATORS designed and made EXPRESSLY FOR STEAM POWER.

TWO STYLES OF HORSE POWERS, viz.: our improved "Triple Gear," and our "Spur Speed," (Woodbury Style), both "Mounted" on *four* wheels.

IF INTERESTED in Threshing or Grain Raising, apply to our nearest Dealer, or write to us for Illustrated Circular (sent free) giving full particulars of Sizes, Styles, Prices, Terms, etc.

Co's in any part of the country. Parties having such claims or holding life policies which they wish to surrender for cash or paid-up policies, can address (inclosing stamp)

BARNES & HANOVER, Tryon Row, N. Y.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer. It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.*

Young Buggist.—The great shining black and lazy beetle which you found in an old rotten stump and send us in a box, is the Horned Passalus, (*Passalus cornutus*). We give the accompanying portrait to help some other young bug or beetle hunter to recognize him. This beetle is not injurious to vegetation, but might with propriety be termed beneficial, for it helps to convert old half-rotten logs and stumps into vegetable mold, which, in its turn, becomes the food of growing plants. It does not attack dry timber, but only that which is so far decayed as to absorb and hold considerable moisture. They are very common in almost all parts of the country and there is scarcely a State in the Union from which we have not received specimens of the Horned Passalus.

C. W. Mallory, Smith's Ranch, Cal.—From week to week I notice "Answers to Correspondents," and as I desire information, I take the liberty to address you, asking name of plant inclosed. I send leaf and seed stalk. Stock seem to be very fond of the plant. The plant in this dry country keeps green the entire year. Can you tell me where I would be likely to obtain the seed? Do you think it would be good for milch cows? I have only a few plants, and cannot obtain seed in this vicinity. Please answer by letter or through the RURAL, at your earliest convenience, and greatly oblige an old subscriber to your valuable paper. ANS.—*Plantago lanceolata*, the Lance-leaved Plantain. This weed is a pest with us, though it is seldom we meet this species with so wide a blade. The familiar names are Rib Grass, English and Buckhorn Plantain.

Medical works say that the leaves are saline, bitterish—the roots sweetish. It has been recommended in ulcers of various kinds and in tumors of a scrofulous character. It is still used as a vulnerary and as a dressing for blisters and sores.

THURBER'S Darlington says:—The seeds being nearly the same size and weight as those of the red clover, they cannot be readily separated—and thus the two plants are disseminated together in the culture of clover. Nearly all kinds of stock eat this Plantain freely, and it has even been cultivated expressly for a sheep pasture; but it is generally much disliked in Pennsylvania.

SHAKSPEARE says in *Romeo and Juliet:*

Rom.—Your *Plantain leaf* is excellent for that.

Ben.—For what, I pray thee?

Rom.—For your broken *shin.*

Ben.—Why, ROMEO, art thou mad!

We know not how healing it may be for ulcers and broken shins—but as to its cultivation, we commend you to patience. Having it already among you, a few seasons will supply all the seeds, if not all the plants, that you will need for any purpose whatsoever.

Subscriber.—Are all varieties of Dracænas raised from canes? If *D. indivisa* is raised from seed, where can it be procured? Also, where can the canes be obtained? Is *Latania Borbonica* raised from seed? If so, where can it also be had? What is the difference between Tacsonias and Passifloras? Please answer through RURAL. ANS.—We do not suppose you can procure canes of Dracænas without purchasing the plants. The whole stems are stripped of leaves and placed in sand-beds. Each joint or node will form roots in a month or more. Or the canes may be cut up in pieces two or three inches long and treated in the same way. Or they may be propagated by tying moss about the stems, a very good method likewise of shortening their legs when this has become necessary by the lower leaves falling off. They are not all raised from canes. *D. indivisa* may be raised from seed, which, with those of *Latania Borbonica*, are offered by several English seedsmen—E. G. HENDERSON of London, for instance.

Tacsonias and *Passifloras* are species very nearly related under the order *Passifloreæ.*

B. A. C., Titusville.—I wish to remove an Arbor Vitæ hedge from the southern to the northern boundary of my premises. The hedge is three feet high and was planted three years ago. Will you advise me when to transplant and if it be necessary to provide new soil for the new trench? How deep ought it to be made. ANS.—It might be transplanted now, if great care were exercised and the plants sufficiently watered, but not later. We advise you to wait until early spring. It is not necessary to provide new soil, though advantageous to do so if obtainable without too much trouble and cost. The trench should be dug at least two feet deep. Use your best soil next to the roots. Preserve balls of earth about them if possible.

H. E. M.—I have a cellar floor which was cemented six months ago. The cement does not set thoroughly. What would you advise? What proportion of sand and cement is best? Is there any choice in sand? ANS.—A mistake sometimes made by inexperienced persons in the use of cement is that too large quantities are mixed at one time. The result is it sets before all can be used. It is a good deal more trouble to mix cement in small quantities than it is in large. Hence indifferent or ignorant workmen adopt the easier course. Supposing the cement used to be fresh and good, three parts of sand are not too many for one of cement. It should be mixed rapidly and used as soon as possible. Coarse, sharp sand is the best. Lifeless, clayey sand is quite inferior.

We would advise you to procure freshly-made cement, coarse, sharp sand, and mix in the above proportions, viz., one part of cement to three of sand, and spread it over your cellar as it is—being first careful to wash the old surface as clean as possible.

Young Farmer.—The Beet-root sugar industries in this country are in a better condition this season than they have been for several years past, but we would advise you to proceed slowly if intending to invest a large amount in this enterprise. Better visit the manufactory at Freeport, Ill., or even go to California and see what has been done there. You will thus learn the mistakes of others, and with this knowledge can avoid making the same yourself. Of course it looks well on paper to say that 3,000,000 pounds of sugar were manufactured from beets at Sacramento, but these simple statements give us no information as to the cost or profits.

Smoker.—It may be true, as has often been stated, that during the visitation of "the great plague" in London in 1664-5 the tobacconists all escaped the scourge, but that would not be a reasonable excuse for a person or people to use the weed when there was no plague about. It is well known that smoke is a preventive, in a measure at least, of contagious diseases, and the Londoners at the time named used fumigation with good effect. But whether the smoke from burning tobacco is any more efficacious than that from other weeds or from wood is a question not as yet fully decided.

Florist.—Double tuberoses frequently revert back to their single form. This usually occurs when the tubers are planted in a poor soil, or in seasons of severe drought, but the young offsets from such bulbs will produce double flowers if given sufficiently stimulating manures. The single flower is the natural one, the double having been produced by high culture.

Inquirer.—We have often seen notices in the Western papers of a fruit called "Solanum, or Nightshade Berries," but in none of them was the scientific name of the plant given. Now, the name "Solanum Berry" may be appropriately applied to the fruit of any of the hundred species of Solanaceæ, among which are the potato, tomato, egg-plant, Jerusalem cherry, peppers, and so on almost without end. We suppose, however, that the plant to which the correspondents of our Western contemporaries refer is some one of the half-dozen or more species of *Physalis*, or Ground Cherry. The old *Physalis Alkekengi*, or Strawberry Tomato, which was introduced here from Europe many years since, has had some reputation as an edible fruit, and the plants have run wild in some localities. The *P. viscosa*, or Clammy Ground Cherry, grows wild all over the Western and Eastern States, the berries being yellow and somewhat clammy when ripe. It is a sweetish fruit, frequently eaten by children, and is harmless. Perhaps this is the "Solanum" so much talked of; but we can only guess at it, because there are a half-dozen other species with somewhat similar fruit.

W.—What is the difference between Pelargoniums and Geraniums? Are they so mixed up that the one cannot be determined from the other by hybridization? ANS.—No, they are *not* mixed up by hybridization, and it is the fault of catalogues that this ambiguity exists. We gave the distinctions in an article which will be found in our issue of May 8, 1875, and to which W. is referred. We need only add that *all* of the tender plants offered by florists under the name of *Geraniums* are *Pelargoniums.*

PLEASE NOTICE.—The note at the head of these columns has been rendered necessary for the reason that we are constantly receiving questions and other communications not accompanied with the writers' name or address. Not only are the name and address essential to protect us from imposition, but it is not unfrequently the case that we wish to communicate with our correspondents.

Hereafter our friends may know that we shall not answer questions or publish MSS. unless the above requirements be complied with.

Trees, Seeds, Plants, &c.

To Market Gardeners.

We call the attention of all interested to the Bloomsdale Early Market Cabbage, of which we this season offer seed at $5 per lb.—also the Jersey Wakefield at $3—raised by ourselves and of *superior quality.*

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?
The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.
This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.
This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.
For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO,
via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York.
9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.
7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars
The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend as a present, at our lowest club rate—only $2.15, including postage.

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

MOORE'S RURAL NEW-YORKER.—This king of Agricultural papers has entered upon its twenty-sixth year, under the most favorable auspices. It is the determination of its publishers to furnish a brighter and better paper than ever. In style, type, matter and editorial ability, there is no paper of its kind that at all compares with it.—*Trempealeau (Wis.) Republican.*

Wit and Humor.

REVENGE!

CHAPTER I.

"This, then, Miss Banks, is your final answer."

"Irrevocably so," was the proud reply.

CHAPTER II.

They made a pretty picture standing in the doorway of her father's mansion; he, the Captain of the Melon Stealers, tall, strong of limb, and the hero of his little first base in many a hot-contested game. She, the fair daughter of the banker, who had wagered the entire assets of the bank and the deposits of many a poor man on the return game between the Moth Eradicators and the home club on the following day. Our hero's answer came hot and quick:

"Then," cried he, "to-morrow's setting sun will shine upon the beggar daughter of a ruined man! It rests with me to throw the game on which your proud father's wealth is staked. You have to-night settled your own fate. So be it. Good night."

And turning himself seven times round on his heel, at the same time boring a large hole in the hall carpet, Mose Fitz Allen was gone.

CHAPTER III.

Prominent among the immense crowd assembled on the grounds is the pale face of Amelia Banks. The Moth Eradicators are at the bat on the last half of the ninth inning, with two men out and one man on the third, and the score stands 53 to 53. "Will that man get in?" is the breathless question which pervades the scene. Mose Fitz Allen, standing on the first base, mutters, "Now for revenge! Now do I give the thing away! Ah!" and his face was, distorted with passion, like a mud ball dried in the sun. "Two strikes!" yells the umpire. The batter must hit it next time. He does hit it, and a fly mounts and descends beautifully to Fitz Allen. "Take it, Mose!" goes out from the throat of Banker Banks and from hundreds of his friends. "Not if Mose is thoroughly acquainted with himself," is his low response, as the ball passes through his hands and the man on third goes home. Score, 54 to 53.

CHAPTER IV.

Two months later finds Amelia Banks taking in plain sewing, her father the janitor of the Oil Exchange, and Mose, though somewhat troubled in mind, still taking his beer.—*Oil City Derrick.*

SPARKS AND SPLINTERS.

A FEATHERED fraud—the gull.

BUSINESS CIRCLES—The wheels of trade.

WHEN a half dozen people are to dine upon a quarter of lamb, what's the proper time to dine? Why, a quarter before six, of course.

REPARTEE.—"Please accept a lock of my hair," said a bachelor to a widow, handing her a large curl. "Sir," she replied, "you had better give the whole wig." "Madam," he responded, "you are very biting indeed, considering that your teeth are porcelain."

"LOOK here, 'Squire, whar was you born?" inquired a Yankee of a five minutes' acquaintance. "I was born," said the victim, "in Boston, Tremont street, No. 44, left hand side, on the first day of August, 1820, at 5 o'clock in the evening. Physician, Dr. Warren; nurse, Sally Benjamin." For a moment the Yankee was bewildered by the thoroughness of the reply, but only for a moment, and he said, "Yeas; waal, I calculate you don't recollect whether it was a frame or a brick building, du yeou?"

A CERTAIN Cincinnati wag lately distinguished himself in New York. Dining at a noted restaurant, he read on the bill of fare a request to the guests to report "any want of attention." He sent for the landlord and with an aggrieved air pointed out the notice. "Has there been any want of attention?" queried the landlord. "Has there!" echoed the wag, indignantly; "I should think there has. I have been here 15 minutes and no one has had the politeness to ask me to take a drink!" Boniface, fully appreciating the joke, at once opened a bottle of champagne.

CRUMS FOR EDITORS.—"Tommy, my son, what are you going to do with that club?" "Send it to the editor, of course." "But what are you going to send it to the editor for?" "'Cause he says if anybody will send him a club, he will send them a copy of his paper" The mother came near fainting, but recovered herself sufficiently to ask, "But, Tommy, dear, what do you suppose he wants with a club?" "Well, I don't know," replied the urchin," unless it is to knock down subscribers as don't pay for their papers. I suppose there are plenty of such mean people." That boy stands a chance for the Presidency, if he lives.

COMFREY AS A FORAGE PLANT.

SEVERAL of our foreign exchanges have of late had considerable to say about the value of Prickly Comfrey (*Symphytum asperrimum*) as a forage plant. Specimens were exhibited at the late Royal Show at Birmingham, Eng., and it is reported that they attracted considerable attention. One of our exchanges, in commenting upon the exhibit, says that "it is expected to take a very prominent place among forage plants, and is said to have produced 120 tons per acre, and to be a great preventive of foot-and-mouth disease."

It is spoken of as a *new* plant, although it is known to have been introduced into England from the Caucasian mountains in 1749. Now, while we have no desire to create a furore over this claimed-to-be valuable forage plant, still it is probably well enough to let our readers know that there is a prospect of its becoming, to a certain extent, popular in this country. We cannot, however, speak quite so enthusiastically of it as a correspondent of the English Live Stock Journal, who says that it "will, without doubt, become one of the best summer forage plants grown, if not *the* best, both in quality and quantity."

Why this plant has remained so long almost entirely neglected by our agriculturists is rather surprising, inasmuch as nearly all the "Farmers' Cyclopedias" published during the past fifty years speak highly of the nutritious properties of this species of Comfrey. Both its roots and stems are very farinaceous, and are greedily eaten by our pigs and sheep. The root is tuberculated, thick and fleshy. The stems are somewhat prickly and grow from six to ten feet high. The leaves are rough-stalked, heart-shaped, broad, tapering to a point, and of a bluish-green color. The flowers are cylindrical, with a campanulated inflated limb, and have a changeable bluish-red color, and appear continually throughout the entire summer.

The propagation is very simple. The roots being taken up in spring, cut into very small pieces and either sown in drills or planted in hills, as with the common potato. The leaves and stems are relished by cows, and may be used instead of corn for soiling, as they impart no bad flavor to the milk. The leaves are said, by Dr. GEORGE JOHNSTON, to give a grateful flavor to cakes, and to be, when boiled, an excellent vegetable. They should be gathered while young, when they form a good substitute for spinach.

Prof. JAMES BUCKMAN, who has made many valuable observations on grasses and other plants especially serviceable to the farmer, observes that while this plant was growing in his garden, he used to amuse himself by taking branches of it to the cows, and that it was highly amusing to see how soon they surrounded him and how eagerly they ate the plants. Dr. VOELCKER, who analyzed this Comfrey, both in its fresh and dry state, declared it to be his opinion that it was a very nutritious forage plant.

Probably many of our readers are familiar with what is called the Common Comfrey, so frequently seen by the roadsides and in old gardens in the Eastern States. This Common Comfrey is known botanically as *Symphytum officinale* or, to put it in plain English, Medicinal Comfrey. The roots contain a large quantity of mucilage, and are frequently employed for the same purposes as flaxseed, slippery-elm bark and gum arabic to allay irritation of the throat, or, to use an old phrase, "griefes of the lungs."

The flowers of the Common Cymfrey are of a dirty-yellowish color, and those of the Prickly a blue and red, which is sufficient to enable one to distinguish the two species, if there were no other marked characteristics, still it is the opinion of some very good authorities that they are one and the same, or that the Prickly Comfrey is only a variety of the Common.

Prof. BUCKMAN on this point says: "On introducing the *S. asperrimum* to my botanical garden, it struck me that notwithstanding the latter is known as a Caucasian species, which was introduced as a garden plant on account of the beautiful color of its flower-bells, yet that the former scarcely presented those marked differences which should belong to species. I therefore determined to plant some specimens of *S. officinale*, concluding that if I could get a plant from the waterside to grow in an upland district, remote from water, so great a change of circumstances would at least exert great influence upon its growth. Accordingly, a plant with white bells was introduced into the botanic garden, which at once grew abundantly, and, the following year, was subdivided into several sets which flowered; but this season, the flowers became stained with a dull, reddish-blue tinge, and each season great changes have gone on in this plant, so that, in fact, in the summer of 1853, it was scarcely distinguishable from the Prickly Comfrey."

There is little doubt of the identity of the two species, and if any of our readers have either growing in their neighborhood, we should be pleased to receive leaves and flower of the same, in order to pursue our investigation further in this direction.

PRICKLY COMFREY.

BLOOMSDALE SEED FARM.

MANY readers of the RURAL who annually procure seed from the various dealers, have little conception of the immensity of the plan upon which they are produced or the great care, skill and study exercised in their production. As an example we cite the business of D. Landreth & Sons, the well known seedsmen of Philadelphia. The head of this firm, Mr. David Landreth, is a hale, hearty old gentleman of nearly eighty, whose kindly disposition beams upon every feature of his face. Spending the larger part of his time upon the Bloomsdale Farm among the growing crops and in enjoyment of the elegant surroundings of foliage and lawns, would tend to civilize the savage and how much more the one who was born and reared for no ordinary niche in the social world. One of the most active members of the firm is Burnet Landreth, lately so well known as Chief of the Bureau of Agriculture at the Centennial Exhibition, whom many Exhibitors and visitors have cause to thank for his untiring energy, his extreme courtesy and his never failing watchfulness in that department while it has been resting under a cloud of neglect and adverse prejudice at the hands of the Commission, which would have long since discouraged a less determined and conscientious worker.

But of the farm. A drive around it was sufficient to demonstrate Messrs. Landreths' skill and ability in its management. The long perfect rows of vegetables must afford intense satisfaction to any observer who enjoys the beauty of mathematical exactness, and their extent was impressive even to one accustomed to seeing vegetables raised on a large scale. Two hundred acres of cabbage, two hundred more of turnips, sixty acres of onions, the same of beets, forty acres of tomatoes, and other varieties in proportion—it would seem that these might furnish seed for the nation.

The object of greatest interest, however, was the experimental field, containing eighty varieties of small grains in cultivation. The seed for these grains was collected at a great expense of time and money, much of it having been imported directly from Greece, France, Russia and other foreign countries. Below we give a list of the varieties, with the numbers of the plots and dates of planting:

Sown September 20th, 1875.—1, Clawson; 2, Deihl White; 3, Treadwell; 4, Shumaker; 5, Muskingum; 6, Post; 7, Arnold's Gold Medal; 8, Mediterranean; 9, Fultz Winter; 10, Michigan Wick; 11, Jennings' White Winter; 12, White Rogers. Sowed September 21st.—13, Tappahannock; 14, Amber; 15, Kentucky; 16, Arnold's Hybrid; 17, Red May; 18, Louisiana. Sowed September 29th.—19, Grecian White; 20, Silver Chaff Fall; 21, Rough Chaff; 22, Hertz White; 23, Victoria; 24, Hallet's Pedigree Hunter's White; 25, Chidam; 26, Fenton; 27, Trump; 28, Kessingland; 29, Browick; 30, Lomis; 31, Golden Drop; 32, Nursery; 33, Hallet's English Pedigree; 34, Russian; 35, Dolt; 36, Walla-Walla; 37, April; 38, Red Russian Bearded; 39, Chila; 40, Oregon Club; 41, Clawson. Sowed November 1st—42, Landomer; 43, De Frankenstein; 44, De Culm; 45, Regenere de Klapkebrun; 46, De la prevote ou du prieure; 47, Empereur; 49, Siegle nhover de Valdin. Sowed October 18th.—54, White Rye; 55, Winter Rye. Sown in greenhouse December 9th.—50, Crimea; 51, Besavobia; 52, Padolic. Sown in greenhouse January 19th, 1876.—53, Arnold's. Sowed April 12th.—56, Milo de Grece; 57, Abevie de Grece; 58, Drynia de Grece Vil; 59, Elutei. Sowed April 19th.—58½, Golden Drop Manitowoc; 59½; Spring.

Barley sown April 11th, 1876.—60, Probsteier; 61, Oregon; 62, Australian; 63, Ushank; 64, Cheyney; 65, American; 66, Hallet's Pedigree Chevalier; 67, Page's Prolific; 68, Scotch Chevalier.

Oats sown April 12th, 1876.—69, Probsteier; 70, Holbeck's Pedigree Canadian; 71, Oregon, 72, Virginia Winter; 73, Mississippi; 74, Hallet's Pedigree, Black Tartar; 75, Excelsior; 76, Sandy; 77, Hull-less. Sowed April 12th.—78, Waterloo; 79, Potato; 80, Extra Early English Manitowoc.

The seeds were planted in drills eighteen inches apart, and were carefully cultivated with the horse hoe—one-eighth of an acre being devoted to each variety. Of wheat, the seeds for Nos. 42-52 inclusive, were imported from France, and Nos. 56-59 from Greece, No. 20 was from Rennie of Toronto, and 21 from H. & W., Lon-

don; 58½ was from Manitowoc, Wis., and 59½ from A. L. Murdock of Massachusetts. The different varieties presented very marked differences in both appearance and quality. The Clawson, No. 1, seemed to be decidedly the best, the straw being strong, the stools large, and the heads long, well filled and heavy. Hallet's Pedigree, No. 24, was also very fine, some of the heads measuring eight inches in length. The seed for this lot was raised by Mr. Landreth in 1875. Hallett's Pedigree, No. 33, was from seed imported from England, and the crop was not nearly so good as No. 24. The same difference was noticed in several other varieties, the crop from raised seed in this country being much better than that from the same variety imported last year. The French varieties were most of them badly winter-killed, and promise to be of but little value.

Walla-Walla, No. 36, was from Oregon, from a crop which yielded eighty-five bushels per acre, but the change of climate seemed to weaken its vitality, and the heads were poor and scattering. The Oregon Club, No. 40, was also badly injured. April, No. 37, is a spring wheat but was sowed in the fall. Most of it was killed by the cold, but the few remaining heads were very good. Dolt, No. 35, a wheat which originated in Pennsylvania, appeared to be nearly or quite the best of the native varieties.

The Hallet's Pedigree wheat, oats and barley are the result of many years of selection and cultivation by Major Hallet, of Brighton, England, and show the beneficial results of careful treatment, all of them being far above the average.

The firm of Landreth & Sons is the oldest in the seed business in America, having been established nearly one hundred years ago, and they are as well the largest seed growers in the world, cultivating nearly two thousand acres of vegetables yearly. The Bloomsdale farm is only one of the four owned by the firm, the others being located in New Jersey, Virginia and Wisconsin. These different farms are devoted to the cultivation of such seeds as may be best perfected in the different localities. About four hundred hands are constantly employed, while at particular seasons this force is largely increased.

Twenty-one tenement houses have been erected on the Bloomsdale farm for their accommodation, so that the workmen form quite a community by themselves. A large portion of the manure for the home farm is brought from Philadelphia by boats, but in addition to this supply, steam mills have been erected for grinding bones and manufacturing commercial fertilizers, which are used for special crops. In 1815, over $20,000 was expended for manures for the home farm, besides which thirty men and five boats were engaged in collecting Menhaden fish on the coast of Virginia the annual application on that plantation being about 7,000,000 fish.

Eleven large barn-like structures are used at Bloomsdale as drying houses for seeds, and all the implements used are manufactured on the farm.

The residences of David Landreth and his son, Burnet Landreth, stand on a thirty-acre lawn, fronting the Delaware river, and are among the most pleasantly located suburban residences we have ever seen. The grounds are beautifully laid out, and are planted with one of the finest collections of trees in this country. The entire collection embraces over twelve hundred varieties, and is especially rich in conifers, having many large and finely grown specimens of varieties which are extremely rare in this country.

Farm Economy.

PURE AND IMPURE WATER.

If there is any one subject connected with agriculture which requires more attention than another it is that of pure water for stock. We believe that many of the virulent diseases known under such names as Black-leg and Murrain of various kinds frequently if not always have their origin in impure water which the animals are compelled to drink. In many localities in this country a "mud hole" filled with stagnant rain water is the only source of supply for farm animals during the long hot summer, and it is no wonder that diseases of various kinds follow such treatment. The Farmers Gazette in treating of this subject tells some wholesome truths which it would be well for our farmers to heed. Although we have had of late some rain, which has certainly done much good, there is still a great scarcity of water in many pastures. We do not think that sufficient care is usually taken to provide against such a contingency, or to husband supplies of water, when these are apt to fail in seasons of drought. We know that some maintain that sheep do not require water when on grass; but this is a great mistake, especially when the weather is so excessively hot and parching as we have recently experienced

During a hot, dry summer which occurred some years ago we found that in an extensive sheep grazing district ewes and lambs were in much better condition when they had full access to pure, running streams than was the case when the sheep pastures were not so well provided; the grass in both cases being in an equally burnt-up condition. But even when the weather has been cooler, the want of pure water in abundance tells on the health of sheep, just as it does on the health of cattle; and as over-wet pastures have their own peculiar diseases, in like manner over-dry pastures engender disease which not unfrequently is attributed to other causes.

A friend of ours, who took an interest in such matters, measured, one hot summer the water consumed daily by a lot of cattle, and as it had to be pumped for them, the quantity used was easily ascertained. The result of his observations was that thirty-six head of cattle consumed daily about 900 gallons of water. Now, bearing this fact in mind, what must be the state of cattle carried by railway and steamboat, when they are confined for twenty-four hours, and in some instances for periods varying in length up to sixty hours, without getting a drop of water all the time, not to speak of the terrible shaking which cattle experience during a journey by rail, and the fatigue caused by their being unable to lie down? Is it possible that animals treated in this way can arrive at the end of their journey in a healthy state, or that their flesh can be in a wholesome state for use as human fo ?

Every medical man knows that impure water is a fertile source of disease in human beings, and innumerable outbreaks of disease of a typhoid nature have been distinctly traced to this cause. In India the use of impure water is certain to be followed by choleraic disease. In the fatal march from Mhow the connection between the outbreak of cholera in the troops and the quality of water they drank was easily perceived. Nothing but the raging thirst, which well nigh maddened the men, would have tempted them to drink the water procured on the line of march. But they were forced to choose between an intolerable craving for water and running the risk of catching choleraic disease, and they chose the latter. Within twenty-four hours nearly all who had indulged freely in drinking the impure water were prostrated with cholera, and died in the proportion of eight to ten.

There does not exist two sets of sanitary principles, one affecting human beings and the other the beasts of the field. Impure water, imperfect ventilation, dirt, damp, and scarcity of food exercise injurious influences on the health of our domestic animals, just as these agents do in the case of human beings; and every practical man should therefore seek to remove those sources of evil as speedily as possible. A correspondent, who resides in a western county, states that it is most distressing to see cattle driven daily for miles along the dry, dusty roads in order to reach water; and if numbers of those cattle should afterwards succumb to disease, it will not be difficult to discover the cause. Splenic apoplexy is frequently caused by impure water, and also by an insufficient supply of water, even when it is pure. This is a blood disease, runs its course with great rapidity, and is exceedingly fatal. Hyposulphite of soda, given in the water which the animals drink, in doses of from two to four ounces, according to the size of the animal, will be useful as a preventive; but, of course, it can only be used when the cattle drink from troughs.

FROM FIELD TO TABLE IN ELEVEN MINUTES.

The citizens of Carollton, Mo., have been employed in ascertaining in how short a time wheat can be taken from the field and put down in bread on the table. The Miller's Journal prints a letter signed by the judges, county officials, editors and other citizens of Carrollton asserting the truth of the following experiment which they watched with watches in hand. The statement is as follows: "The undersigned citizens of Carrollton and vicinity certify that at a trial made this day for the purpose of ascertaining the time in which bread could be made from wheat taken in the field standing, the following time was made by J. F. Lawton, proprietor of the mill: Commenced cutting with reaper at 3:01 P. M.; finished cutting, 3:02; began threshing at 3:02½; finished one bushel at 3:03¼. Commenced grinding at 3:04¾; finished at 3:06¾. Mrs. Lawton began making bread at 3:08; finished at 3:08½. Griddle cake baked at 3:09¼; and biscuit baked and eaten at 3:12; the whole accomplished in 11 minutes. The reaper and thresher and the mill were thoroughly cleaned out before the trial commenced and not a particle of flour was used that did not come from the wheat cut in the above trial. The witnesses kept separate time and in the result all time agreed."

If this can be done in so short a time, why need any one be hungry? All a man would need to cook his own breakfast on a journey, would be a field of wheat, a threshing machine and a flour mill. We commend the above to be printed in the next edition of the "Tramp's Guide" as a recipe for a hasty breakfast.

The Poultry Yard.

KEEPING POULTRY.—No. 4.

After procuring the fowls desired, the next thing, if not already done, is to build a suitable house for their accommodation. This need not be an expensive one, even for health and comfort. Many an amateur fancier has enjoyed his first attempt at building a small domicile for his favorites, as much, or more, than others have done by spending their time in idle leisure. I can look back with pleasure on some of my best holidays being spent in such work. The best situation for the building that circumstances afford is to be sought, whether it be in a small yard in town or a large one in the country.

I shall not at this time give a plan of a poultry house, as it would only suit a few cases, but I shall give such general hints as need to be considered in all well-arranged buildings, large or small. It should not be exposed to northern or western winds any more than can be avoided. Never have openings or runs with such exposures in cold latitudes. East, southeast or south should always be chosen for the front, with glass, when possible, in the east and south sides, but never in the roof, as this would admit too much heat from the sun in summer, and in our severer latitudes the cold in winter at night, even though a house be built never so warm.

A good, warm roof should be on all poultry houses. If not protected by a higher building or hillside, bank up the two cold sides with earth and sod them. It is painful to see what little attention is paid to this kind of protection through all the Eastern States, while a mere trifle of outlay in money and but slight labor would make the fowls comfortable. If fowls are worth keeping at all, they are worth taking proper care of, and will repay the extra attention given to their comfort.

It is a singular fact that while fowls make a great many more expressive sounds than any other animal, they have not *one* note with which to call attention to their want of food or care. The horse neighs when he desires anything, the cow moos, the pig grunts, the cat mews, and the dog whines, but the innocent, harmless fowl has never a note, out of all its variety, with which to chide man for his neglect. Be it ever so badly treated, it can only look up imploringly in his face or, if at liberty, run after him. This fact alone should inspire vigilance on the part of poultry keepers and cause them to look well to the wants of their fowls. The material for the house can be such as is near at hand.

If stones are plenty, use them, as there is nothing better for the foundation and walls than rough stones laid in mortar, and they make a house both cool in summer and warm in winter. If stones are scarce and gravel handy, the walls can be made of concrete. To build a concrete wall, it is necessary to set up side boards in which to run the mortar and gravel.

Where the winters are not cold, earth houses may be used to advantage, having the aid of side boards in building the walls as you would for concrete. The method is thus described by Mrs. Elizabeth Watts:

"A foundation of brick or stone must be used, which can be brought about nine inches above the ground. The proper earth is neither sand nor clay, but partaking of both. Clay, chalk, or any calcareous earth are bad for the purpose. The earlier in the season the building can be done the better it will be for drying. The wall is made by ramming in the earth while damp, supported during the process by a mold formed of two planks or inch board of the required length of wall, twenty inches wide, formed of two breadths, strengthened by cleats nailed outside. Cross-bolts fix these planks together, two, near each end, with as many inches between the two boards as the wall is to be thick—say 14 or 16 inches. The bolts have large heads at one end to fix them, and eyelet holes and cross-pegs at the other. Place the planks above the foundation, bolt them together and fit bits of board into the ends, to prevent the material running out there, the little boards fitting in between the top and bottom bolts and making, with them, the mold into a sort of box. Then work up well the earth, a little at a time, mixing in cut straw or similar material to bind it. When used, it should have just moisture enough to adhere together under the pressure of the thumb and finger. Ram in no more at a time than will make an inch and a half when well rammed. The rammer for this work should not be more than an inch and a half wide.

"When the earth is well rammed down and reaches as high as the mold will allow, take out the cross-bolts, remove the planks and fix the mold further on. The bolt at one end being fitted into the hole by that at the other, only one end board is required.

"When each layer of the wall is completed the mold must be placed higher, fitting the bottom bolts into the holes left by the top ones, and after each course pour over the surface (in order to make the next course adhere, and also to give a good appearance) a small quantity of thick grout composed of one-fifth part lime and four of earth.

"Before the walls dry, the holes left by the bolts must be carefully stopped up with mortar composed of one-fourth lime and three-fourths earth. If the same mixture be used for the wall, it will become dry and almost as hard as stone."

By using gravel, lime and sand (one barrel of lime to one load of sand, instead of earth), we have a fine concrete wall, fit for any building.

If boards be used for building the walls, tarred paper or felt placed between the outside weather boarding and the inside sheathing will make it much warmer. Plaster on lath is still better, and makes a very clean wall. A very small house, one board thick, can be made warm in winter by lining the inside with straw, lath being nailed over the straw to protect it from the fowls.

It would be well to think over these general principles, so that when one gets a plan for a house he can at once go to work. I shall next speak of interior arrangements. H. Hales.

POULTRY EXHIBITIONS.

Dear Rural:—The time will soon be at hand when the usual annual Poultry Exhibitions will be held all over the country. The managers of each are, of course, anxious to secure the best stock, and to that end offer great inducements in promised premiums; but the manner in which many of these Exhibitions have been conducted of late years would seem to prove that securing the birds for show was their first and principal aim, and the carrying out of their self-imposed obligations toward those who sent valuable fowls and complied with all the rules laid down for their guidance a secondary consideration, if they did not ignore them altogether.

Intending exhibitors should think over these matters in time, as fowls can only be shown at a limited number of Fairs. Sometimes two or three occur simultaneously, and it is important to fanciers that they send their stock where they will get fair play. I fear that there has been a squeamish reluctance on the part of the poultry press about saying much relating to this matter. But does that make things better? Does it not tend rather to confirm, or even increase, such unjust proceedings? Are not exhibitors as much the patrons of the poultry press as officers of poultry societies, and are they not equally entitled to fair consideration at its hands?

Without naming any particular Society, a few facts illustrating specimens of their management last season will suffice. One Association offered two thousand dollars in premiums, but when they were awarded they amounted to no more than four or five hundred dollars. Many fine pens of fowls coming from a distance were not awarded first premiums, although every way worthy, but were given second premiums. Was this economy or was it something worse? Another Association, whose liberality, according to its printed programme, was to eclipse everything ever before done in this country, compounded with its exhibitor. Another takes money to make *combination* premiums (a better name could not be found), gives one near exhibitor all this combination in three installments, first, second and third, all to one variety of fowls in three pens, or first, second and third regular premiums, overlooking the pens that took first and second premiums in same breeds of another variety, equally eligible, and which had contributed their quota to the same combination premiums. When an inquiry is made of the officers, they answer by coolly sending on the list of awarded prizes, but do not condescend to give any explanation. Another noted Fair (and a finer lot of Asiatics than those exhibited at it were never in each other's company) paid not one cent in premiums, the fault being laid to the dishonesty of one of its officers. But is it probable that he could have had all the money offered in premiums and at the same time a surplus sufficient to pay expenses of the Exhibition?

Would it not be more to the interest of all concerned to offer smaller premiums and pay them promptly and honestly? As your valuable journal at all times takes to the side of truth and justice in whatever form it comes, without fear or favor, I will ask you whether any body of men have a right to publish a list of offers to exhibitors, before making the requisite arrangements to carry out and meet all obligations, as many good and worthy Societies do year after year? At all, or nearly all, of these Exhibitions a pretended point is made to make all happy who may visit them, and the officers well know how to do it, allowing none to go away dissatisfied, harmony being the main support of all institutions

Dairy Husbandry.

THE BRITISH DAIRYMEN'S ASSOCIATION.

IMPROVEMENTS AND POSSIBILITIES IN DAIRY HUSBANDRY

The British Dairymen's Association seems now to be assured, and from the effort there is being put forth in England to make it useful, it will without doubt prove a success. On Aug. 4 an adjourned meeting was held in the Town Hall, Derbyshire, and Mr. SHELDON, a well-known agriculturist, read an interesting paper showing the advantages to be derived from such an Association and what was hoped to be accomplished through it.

Mr. CROMPTON, the Chairman of the meeting, referred to the growing trade in fresh milk for village and city consumption, from which it would appear that a vast demand had lately sprung up for this article of food. He believed the sale of milk would continue to grow under the development of the factory system, and it would be a far more paying thing than the manufacture of cheese. Those factories which were near the railways and had easy access to the telegraph would be able to show a very successful balance sheet at the end of the year. The plan of connecting factories with the milk trade seems to be of considerable advantage and is of recent origin in England. The plan is to have factories in near proximity to the railway station and delivery depot, and a telegraph dispatch is sent daily from the city to the manager of the factory, giving notice of the quantity of milk required for the day. On some days a much larger quantity of milk is needed than on others, but by having the daily requirements telegraphed there is no loss, as the milk not wanted for city consumption is not forwarded, but is made into cheese at the factory.

Why could not this plan be made to work successfully in America? If the milk farmers organize and build a factory near the depot where milk is to be delivered on the train, and if the orders for milk be made on the factory from time to time by telegraph, the arrangement would be carried on with less trouble to farmers, with less loss on account of surplus milk left over from time to time in the city, while a saving would be made on the freight of such milk. The plan would seem to have important advantages over that of locating factories in the city at the end of the route, an account of which was recently given in these columns.

Mr. SHELDON, in his paper which was read at the Derby meeting, speaks of the great apathy and indifference of English farmers in regard to improvement in dairy husbandry. As this will without doubt be changed when the Association gets in good working order, Mr. S. says it must not be supposed that the object of the Society will be confined to cheese making alone. It will embrace a much broader field, and among the branches of dairying which will come under consideration, there will be, in addition to cheese making, "butter making, the supply of milk to towns and cities, condensed milk manufacture, the marketing of dairy products, the feeding of cattle and the raising of stock, together with other matters and details connected with the above subjects." He thinks that only in a few instances can cheese making be regarded as having come at all near to perfection, and that some people declare that the cheese produced to-day in England is, as a rule, inferior to that which was made half a century ago. In support of this opinion he cites the views expressed by Mr. JOSEPH ASTON of Cheshire, who says:

"It is lamentable to witness the apathy and indifference which are manifested by a great number of cheese makers upon a subject in which they ought to take a deep and an abiding interest. There is a great lack at the present time of intelligence, energy and skill on the subject of dairying. For a number of years nearly all other branches of farming and husbandry have been advancing, but it is very questionable if any improvements have been made in cheese making. I presume it will be admitted by all aged and experienced judges that the bulk now manufactured is of an inferior quality and much more perishable in its nature than it was fifty years ago."

Mr. WALKER, another practical dairyman, observed that cheese making had got to be a more difficult and less paying process every day, in proof of which he said that his wife, who had made cheese for a long time and who had formerly manufactured it at considerable profit, now found it almost impossible to make it in a manner that would pay. They found it almost impossible to make it so that they could derive a profit from it. He thought the transit of milk to London and other chief towns was open to great improvement, and if that improvement could be effected, it would largely benefit farmers generally. He had but just returned from the Royal Agricultural Show at Cork, Ireland, and found great pleasure in inspecting the butter, of which there were some very fine samples, the very best being only from 28 to 30 cents, gold, per pound. But the Irish farmers at the present time found that butter making was not at all profitable. Although they had a great breadth of land, they could not afford to buy stock to put on it; and what was to become of the land in the future he did not know, nor did he think they did.

The facts brought out in the foregoing remarks very plainly show, we think, that the public generally has of late years been educated in its taste for *fine goods*. We presume the facts are not that the art of butter or cheese making is not so well understood as formerly in the districts referred to, but that the great improvement in America and other countries has raised the standard of dairy goods, and that in certain dairy sections in England the dairymen have not kept pace with this march of improvement. The introduction into England of a better class of foreign goods has educated the people to like better things than formerly, and hence the difficulty in suiting consumers with a comparatively inferior article, and hence such goods do not pay. It is the same in America, and we not unfrequently hear people remarking that the cheese of thirty or more years ago was altogether better than that now produced. They forget that their taste has been educated, and that as we have improved in the quality and make of our dairy products, an improved taste is not satisfied with anything common, but is continually seeking for something that is better and better. If it were possible to reproduce to-day the best cheese of thirty years ago with all its peculiar characteristics, the lovers of good cheese, under our present standard of taste, would be surprised that they could ever have liked so inferior an article as that of olden time.

The same rule may be applied to many other things than our dairy products. As wealth increases our whole style of living has underwent a change, and what was considered almost perfection thirty years ago is now found to be far down in the scale of common and inferior things. Hence the importance of being up and doing, in order to be well abreast of the improvements that are being made from day to day; and this is especially so in regard to dairying. The general standard of our goods has been raised, and what a few years ago was tolerated is now considered "worthless trash" and is not wanted in the markets.

With all due respect to our English friends, we must express the opinion that the art of dairying has remained nearly stationary over a considerable part of England (though not in some counties, like that of Somersetshire), and what has tended more to this state of things is the lack of intercommunication among farmers in the different counties and the peculiar systems of cheese making in different counties, which have been persistently adhered to. The advantage there from a British Association, by which dairymen from the whole realm may be brought together to compare notes and discuss the merits of different processes of manufacture, as well as on other branches pertaining to dairy husbandry, must be very great; and we look forward to a spread of intelligence and a flood of light on the subject which will be of value to dairymen on this side of the Atlantic.

And now that British dairymen have adopted the American plan of conventions, we hope there will be no narrow views on either side to prevent the spread of intelligence and intercommunication between the dairymen of the two countries, but that both countries make common cause in progress, so that this branch of industry shall be developed and brought to a high state of excellence. We believe there are possibilities connected with the dairy which are to be reached and which must raise this branch of industry to a much higher plane than that now occupied by those most successful and experienced in the business.

SETTING MILK.

THERE are patent pans sold here, some of which are intended to set the milk 6 inches deep and others 4 inches, but we are inclined to think that shallow setting produces the most butter. Which in your opinion would be the best pan to buy, the deep or shallow setting pan? —SIXBURY & BLODGET, *Lowville, N. Y.*

Whether it is best to set milk deep or shallow for butter making will much depend upon the method employed for reducing the temperature of the milk and the degree to which it is reduced. Thus upon the Swedish system it is claimed that the best butter is obtained by setting the milk in ice water and reducing the temperature to about 35 or 38°. HARDIN'S method, which is a modification of the Swedish system, cools to 49° by using a refrigerator box and cooling the air in the space where the milk stands. Some of our "fancy butter" makers of large experience say they can get as much and better butter on the HARDIN plan than they can by shallow setting. In both these methods the milk is set about 14 inches deep, but it is not massed in large quantities, the cans for holding the milk being only 8 inches in diameter by 18 to 20 inches deep.

The large pans are generally made to take the entire mess of milk from the dairy at one milking, and in cooling the temperature of the milk is reduced by flowing cold water in the reservoir under the pans. Where the cooling is effected in this way with spring water, it is better not to mass the milk in large pans, as there is more liability of its not keeping sound as long as when spread out thin and in smaller quantities. For this reason we should prefer shallow setting, as giving the best results in the two pans.

We have assumed, it will be seen, that the pans are of the same character and the cooling effected on the same principle with cold spring water. Possibly the pan designed for milk to set 14 inches deep may have some features about it different from what we have supposed, as, for instance, cooling with ice and water by flowing the latter in a vat resting on top of the milk. We, therefore, state only the result to be obtained with the different patterns of large pans as they have been commonly used. In these the general experience of butter makers is that shallow setting gives the best returns. We may remark in this connection that the question of deep and shallow setting is a mooted one, and each system has its advocates. Under different circumstances and conditions there is a difference in favor of one or the other, but without doubt, under favorable circumstances for each, an equal amount of butter from a given quantity of milk can be obtained from either plan.

NOVEL MILK HOUSE.

LAST summer while traveling in California we visited the Napa Valley. The weather was intensely warm during the day, though cool at night. About seven miles north of Napa City Mr. JESSE GRIGSBY has a butter dairy, and the following plan for controlling the temperature in his milk house is given by the Napa Register. It says the dairy, though small, is one of the cleanest and best arranged in the State. The milk house is constructed with a view to coolness and perfect ventilation, and consists of a building within a building:—"The outer is a frame house, 14 by 26 feet, and is one story high, and within this is another house, 10 by 18 feet, the walls of each building being quite thick, with a free passage-way between the walls and roofs of the houses. In the inner house are the racks on which are placed the pans of milk." The dairy consists of 23 cows, which are now fed in a barley field about one-third of each day, and are then turned into a large field of alfalfa, where pure water is plenty, and as a consequence, says the editor, "the cream from the milk is very rich and the butter is of a superior quality."

During our stay in California we took notes on quite a number of dairies which we had hoped before this to give in the RURAL. We regret having missed seeing Mr. GRIGSBY'S dairy, as we should have been glad to have examined this novel dairy house and tested his better.

THE DROUGHT AND FODDER CORN.

THOSE dairymen who made ample provision for soiling their stock by raising a crop of corn fodder are now, during the severe and protracted drought, reaping the benefit of their forethought. Pasturage at this writing (Aug. 24) is scanty, brown and dried up over a wide extent of country, and in many instances where cows are receiving no extra feed the shrinkage of milk has been very large. Many farmers, for lack of other forage, have been feeding hay, and this must reduce the winter supply, which at best is below an average quantity in Central New York. Dairymen who have been led astray by the foolish advice of such men as HARRIS LEWIS, who for some years has been strenuously preaching against the raising of corn fodder, stigmatizing it as an almost worthless crop for soiling, will now have ample opportunity to compare the yield of milk from those herds which have their daily rations of fodder corn with those herds which get no such extra feed. Farmers who are feeding corn fodder are now able to keep up the flow of milk from their herds to the usual quantity, and so far as we can learn there has been no fault found with its quality, while on the other hand the half-starved cows on the scanty and brown pasturage, with no supplementary food, are yielding milk that is quite inferior.

In feeding sowed corn it is always well to have the rations cut some hours in advance of the time of feeding, in order that the stalks may be exposed to the sun's rays and wilted. It may be remarked in this connection that cows ought not to be allowed to run down thin and shrink in their milk at this season, and where corn fodder or some other green crop has not been provided for soiling, wheaten bran mixed with ground oats will be found to be a good feed both for producing milk and keeping up the condition of the animal.

Seasons like this carry a convincing argument in favor of the value of corn fodder as a soiling crop to bridge over the defects of scanty pasturage; and we hope those who are feeding fodder corn as a supplementary forage will make a record of results as compared with those who are depending wholly upon pasturage, because the crop ought to be grown more extensively than it is by dairymen.

The Herdsman.

STRANGE CATTLE DISEASE.

EARLY in the month of May, '76, the firm of J. S. AMES & BRO'S. of Hawley, Pa., bought fifty head of Kentucky steers in the St. Louis market. Those cattle were carred and shipped to them from there and arrived at their place all safe and sound, and as fine a lot of cattle as one would wish to see. Those cattle were put in pasture with a number of our native cattle and all did well together.

The pasture is new land and seeded nicely with clover and timothy, and is well provided with shade and living springs of water, which afforded them plenty of cool drink, besides a nice brook ran through the pasture. The pasture itself contains between two and three hundred acres. Up to August 15 the herd all grew nicely and their owners were about to ship them to New York when one cow, a native was found to be sick. She was taken from the herd and well cared for. She became gaunt and thin, refused water and food, hung down her head and appeared very dumpish, showed no symptoms of poison whatever. Her urine was dark as blood, but thin and not clotted. Upon close examination it was found that the cow was infested with a strange tick or bag, of a dark blue color and in shape like a wood-tick or sheep-tick, only larger and longer.

Those bugs bored themselves into the creature so deep, and adhered so strongly that in pulling at one it was as likely to pull apart, leaving the head in the animal as it was to pull off entirely. Medicine was immediately given the cow for bloody urine and tobacco tea, used externaly to remove the bugs but to no avail, for in about forty-eight hours from the time she was noticed to be unwell, the cow died.

By this time more of the native cattle showed the same curious disease, and every available means was tried but to no avail, each one that was taken died, some natives and some Western.

Upon opening the body it was found to be fearfully inflamed internally, and to appearance the animal had been fairly burned to death by an inward fever. All medicines however powerful, seemed to have no effect whatever upon the cattle after having taken the disease.

Up to this time, August 28, fourteen head have died out of the herd. What the disease is remains a mystery, whether the blood becomes poisoned by the bugs (which one would rather doubt) or whether it is a new disease, remains a mystery. Learned cattle physicians and horse doctors are puzzled, no one has ever seen anything of the kind in this place. Up to this time nothing has been found which will have any effect upon the animal internally, nor has any thing been found, not even rank poisons, which will remove the bugs from the animals.—C. H. W., *Hawley, Pa.*

IF any of our readers can throw any light upon this cattle disease, we will be pleased to hear from them.—ED. RURAL.

WHAT IS PURE BLOOD?

AT the recent Short-Horn Breeders' Convention, President WELSH of the Iowa Agricultural College said:—"While coming here to-day, I was thinking of the important subject, How long shall a thoroughbred animal be bred by crossing with a scrub before becoming pure blood? In England they cross four times with the female and five with the male. We take a half-blood and cross with a pure, and at the fifth cross we have an animal with thirty-one parts pure blood to one part scrub—that is, if we compute the crosses arithmetically—but when we take into consideration the fact that the pure blooded animal is prepotent over the scrub, then the animal has but a minute portion of scrub blood. When a pure-blooded Short-Horn bull is crossed with a scrub cow the result cannot be computed arithmetically, for the prepotence of the thoroughbred animal over the scrub controls to a greater or less degree the value of the progeny."

LICE ON CATTLE.

DUST them over with earth, sand is the best but any earth is effectual. This is the remedy that nature teaches them to use and when they can get to the ground they will take care of themselves if not too poor and weak! So writes one of our old correspondents.—ED.

Sheep Husbandry.

SHEEP AND WOOL.

We are indebted to J. R. Dodge, Statistician to the Department of Agriculture, for a copy of the "Report on Sheep and Wool at the Vienna International Exhibition in 1873." Although it has taken three years for this report to pass over the line of "red tape" and reach the public, it is, nevertheless, a valuable compilation, and we thank the author just as earnestly as we would have done had it appeared more promptly, because we presume the delay in publication has been through no fault of his. In speaking of the different breeds of sheep exhibited, Mr. Dodge says:

The merino families of sheep greatly predominated, as they do in all countries in which wool rather than mutton is the aim of the breeder. England, with a dense population to feed and lands of high price, sent only long and middle wools. Germany contributed mainly Merinos, thorough-bred and cross-bred, pure bloods and the ameliorated "land sheep" of the country, with a fair proportion of the various breeds of English mutton sheep. France sent only the Rambouillet Merino, which is the nearest approach to the meat-producing types of Great Britain yet attained by the wool-yielding race of Spain. Italy was represented only by the Bergamask sheep, an ungainly race, bearing a medium wool, and characterized by long legs, long and pendulous ears, and white face and fleece. There were no living representatives of South America, Africa or Australia, but the wool from those countries in the Exposition was nearly all of the Merino type.

The predominance of Merinoes of the various families was very marked among continental exhibitors. Of the 377 animals from Germany, 291 were of this blood; 27 were Southdowns; 26 Oxfordshires; 8 Shropshires: and the remainder Suabian, Franken, and "Haidesnucke." A still larger number of Merinoes, though not averaging so high in purity of blood and other points of excellence, are found in the Austrian contribution—not less than 322 being entitled to this distinctive name from the predominance of Spanish blood. The Southdowns appeared to hold the next place in public estimation, having 68 Austrian representatives, with a strong strain of Down blood in no less than 25 placed in the merino class, and Cotswold-Downs, Southdown-Paduaner, and Southdown-Birki. The Zackel race and "Gadegast" sheep complete the list of 467 animals entered. Hungary presented 322 merinoes and grades in a list of 431, the black Siebenburger, the Wallachian, Zackel, Zigara, and other natives, constituting the remainder.

While this predominance of a single race is so evident, it is true that a tendency has been felt for years, growing stronger yearly, toward a larger infusion of English blood, and a greater comparative importance to meat-production; and the result of this exhibition, most of the English representatives being distributed for breeding-purposes, will be a manifest strengthening of this tendency. The improvement of Merinos, so marked in the last twenty years, has been in the direction of larger yet more compact frames, enlarged flesh-taking capacity, and earlier maturity, with a coarser but heavier and more profitable fleece. Not less active than in the United States, for a generation past, has been the effort to mold the original flocks to suit the changed demands of the woolen manufacture and the pressing requirement for meat. The examination in detail of the material of the exhibition of the several countries will illustrate these aspects of sheep-breeding in Europe.

England.—The Southdowns take the lead in point of numbers, with 40 animals; 20 from the flock of Lord Soudes, Elmham Hall, Norfolk; and as many from the Merton flock of Lord Walsingham. The former represented a flock of 1,200 pure-breed Sussex Downs, founded in 1823, and distinguished for symmetry and thriftiness. They were sold to go to Hungary, Galicia, North Germany and Russia. The latter, from a flock of world-wide renown, were sold to the Archduke Albrecht for his estates in Austria; to Count Fries, Czernahora, Moravia; Baron Magnus, Drosha, Saxony, and to breeders in Russia. The Elmham Hall rams yield fleeces of 8 to 10 pounds, and those of Merton Farm are quite as heavy.

The Cotswolds numbered twenty-six in three entries. Those from the Agricultural College Farm, Cirencester, Gloucestershire, twelve in number, representing a flock of 200 ewes and 60 rams and 180 fattening sheep, illustrated well the especial aims of breeding at the college farm, viz., a heavy fleece, depth of flesh, and great hardiness. The fleeces weigh from 13 to 20 pounds. The rams are in great request for cross-breeding with Southdowns, Hampshires, and mountain sheep, to give length to the fiber and weight to the fleece. There were also eight from Mr. T. Beale Brown, Salperton Park, Gloucestershire; and six from Thomas Fulcher, Elmhall, Norfolk.

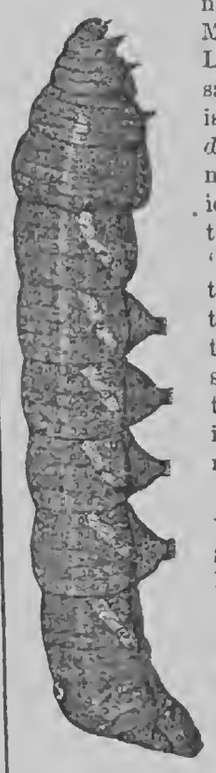
Germany.—The Merinos of Germany have been greatly modified in later years by crossing, so that it might be impossible to find a flock with the precise characteristics of twenty years ago, though bearing the same name. The Electoral, Negretti, and Rambouillet are mingled according to the whim or judgment of the breeder, the better to suit his views of the demands of the market for wool or meat, and the result is the loss of the distinctive character of the originals. The spindle legs have been shortened, the flat ribs rounded, the bald head covered, and the very fine super-Electoral fleece has been displaced by longer, coarser, and more abundant wool, which brings more money at a slightly reduced price per pound.

Entomological.

GRAPE-VINE CATERPILLAR.

I send, inclosed in a tin box, a few caterpillars found eating the leaves on an Isabella grape-vine. Please tell us through the Rural New-Yorker what they are?—Jeff Glidden, *Orleans Co., N. Y.*

The caterpillars sent are the larvæ of the moth figured on page 105, August 12, of the present volume of the Rural New-Yorker, under the name of the Satellite Sphinx Moth (*Philampelus Satellitia*, Linn). We may, however, say right here, that this moth is, without doubt, the *P. Pandora* of Hubner, as the former is a native of South America, the confounding of the two species by Harris in his "Insects Injurious to Vegetation" having been perpetuated by most of our late authors. But the fruit grower is seldom interested further than to know the common names of insects and how to check their ravages.



The specimens you sent were only about one-third grown, or a little over an inch long, and upon the caudal extremity there was a long pink horn which would have grown shorter at each successive moult until at last disappearing entirely, the full-grown caterpillar appearing as shown in the accompanying portrait of a medium-sized specimen. As we have already stated in the Rural of Aug. 12, these caterpillars descend to the ground in the fall and pass the winter in the pupa state, provided no accident or enemy prevent. But in all the specimens you sent us, the presence of an enemy was quite apparent, and not one of the number could ever have passed another moult, much less reached maturity, for they were literally alive with parasites. These parasites are a very minute black fly which deposits its eggs upon the body of the caterpillars, they hatching very soon and the grubs therefrom pass under the skin of the caterpillar, eating out the fleshy parts, but do not penetrate to the vitals, as in that case they would kill their victim all too soon to serve their purpose.

In the meantime the caterpillar feeds away, trying to lay up flesh or fat for its own future use, but all to no purpose, for the score of little parasitic worms hidden under its skin takes every particle as fast as deposited. Matters proceed in this manner for two or three weeks; caterpillars are eating the grape-vines while the little grubs, which are eventually to become flies, are eating up the caterpillars from within, all unseen though they may be to human or other eyes. The fight is a desperate and silent one, but numbers in this case count more than individual strength, and the larvæ of the little fly is sure to conquer the huge caterpillar of the Sphinx Moth. When the little grubs within the moth are ready to make a change, they come out through little holes made in the skin of the caterpillar upon which they have been feeding for so many days or weeks, but instead of bidding adieu to their now almost helpless victim and departing hence, they make him serve a still further useful purpose. Each little grub as it comes forth, from its subterranean labors stops upon the back of the caterpillar, throws out a few silken lines to make its hold secure and then proceeds to enclose itself in a neat little cocoon of the finest and softest white silk. These little cocoons are about an eighth of an inch long and one sixteenth in diameter, and they are frequently so numerous as to cover the entire back and sides of the infested caterpillars. The specimens received from Orleans Co. were covered with the cocoons of this parasite and many of the little flies had hatched out during the journey and escaped when the box containing them was opened. It is scarcely necessary to state in conclusion that whenever a caterpillar is found upon grape-vines, tomatoes or other plants, with small white cocoons upon its back it should not be disturbed, because not only is its fate already sealed but the little parasites if let alone will destroy thousands more of the same and perhaps of other species.

This is but one of the many reasons, why we have so frequently said that a man needs to know something of entomology in order to be able to fight insect foes intelligently and effectually.

The Apiarian.

HONEY, HONEYCOMB AND WAX.

It is a mystery to many why honeycomb is worth from $2 to $4 per pound; and yet it is true, when we take into account that it is made from honey, of which it requires twenty-five pounds for a swarm of bees to make a pound and a quarter of nice honeycomb.

The Cincinnati Gazette explains the matter as follows:—The bee fills itself with honey, and when combs are to be made, the larger part of the swarm will form or cluster themselves into a festoon or bunch in the hive, and by so doing they get up a proper temperature of heat, which causes the honey already in the bees to secrete into wax, and pass through the little flaps, or pockets, on the under side of the abdomen, in the shape of small, white scales, which we can often see quite plentiful on the alighting board. These scales are taken off of each other by the bees themselves, and while it is in a soft, pliant consistency, they make their combs, first forming the very thin sheet which serves as a partition between the two sets of cells.

If we would take the proper calculation of the value of honey, and the amount that a good busy swarm can gather daily, we will find it takes about twenty days for bees to fill their hives with the necessary amount of comb, which if clean will weigh one and one-quarter pounds. We have found, in some instances, when the honey harvest was good, that bees will collect and bring into their hives five to twenty pounds per day. I have often known a good strong stock to gather fifty pounds in the long days of August, when the white and Alsike clover were in full bloom.

Now, dear readers, let us make a fair calculation in this matter, and we will find that at five pounds per day the bees will gather and store one hundred pounds in twenty days. This, at twenty-five cents per pound, would be twenty-five dollars. Suppose we had plenty of nice combs in good movable frames, to have exchanged with our bees, as they filled up, in place of forcing them to build new, and using up the precious nectar in making combs, which to say the least of it, would not be less than fifty pounds of honey. At the price above named it amounts to $12,50; and now reduce this one-half, and we see very clearly that honeycombs are far more valuable than the wax that might be made from it, which sells at twenty-five to thirty cents per pound. The best yield that can be made from an ordinary class of old comb is a single pound of wax to one and one-fourth pounds of comb, which makes a difference against the wax of $6.25.

I have given you the facts in the case; will you study the matter over, dear reader, and forsake the old-time system of bee-keeping, and try to reform in this, the most pleasant, if understood, of all kinds of business, that an invalid, especially, and ladies with small capital, might engage in with profit?

HONEY-BEES AND MUSIC.

It has often been asserted that insects do not hear, upon no better foundation than that entomologists have been somewhat at loss to find organs which correspond to ears in other and larger animals. The following from the London News, has a direct bearing upon the subject and seems to point to an affirmative answer to the question:

The question whether bees have the power of hearing is a mooted point among naturalists. Sir John Lubbock has tried experiments with his bees in order to elucidate the matter. Thus he has played the violin close to his bees, he has tried a dog whistle, a shrill pipe, a tuning fork, and shouting, but no noise seemed to disturb them in the least. Nevertheless, a curious occurrence took place a few days since at Windsor. Col. Stewart, commanding officer Second Life Guards, reports that a few days since, when the regiment was returning down the Long Walk from a field day, a swarm of bees, attracted by the music, followed the regiment into barracks, flying about over the heads of the band. On arriving at the barrack-yard the band formed up to play the regiment into barracks; the bees followed their example, formed up also and settled on a branch of a tree over the heads of the bandsmen. They were at once taken prisoners by the corporal of the guard, and are now hived in the barrack-yard. The distance over which the bees followed the band was more than a mile. We have heard of spelling bees, but these are musical bees with a vengeance. It is a common practice in the country to collect bees by means of rattling a warming pan with a piece of iron, or shaking a stone in a tin kettle, and the idea that bees will follow sounds is as old as Virgil.

BASSWOOD FOR BEES.

Every bee keeper is probably aware of the fact that bees, in regions where the common Basswood or Linden tree abounds, gather large quantities of the finest honey from these flowers. Knowing this, we often thought it strange that farmers did not plant these trees more abundantly for shade and ornament about their grounds. Early autumn—so soon as the leaves are ripe or begin to fall from the trees—is as good a time as any to transplant these trees.

The Naturalist.

MAN NOT DEGENERATING.

In a caustic article, on the alleged degeneracy of mankind, the London Spectator says:—There is not the slightest evidence anywhere that man was ever bigger, stronger, swifter, or more enduring, under the same conditions of food and climate, than he is now.

As to bigness, the evidence is positive. Modern Egyptians are as big as the mummies who were conquerors in their day, and modern Englishmen are still larger. There are not in existence a thousand coats of armor which an English regiment could put on. Very few moderns can use ancient swords, because the hilts are too small for their hands. Endless wealth and skill were expended in picking gladiators; and there is no evidence that a man among them was as big or as strong as Shaw.

No skeleton, no statue, no picture indicates that men in general were ever bigger. The Jews of to-day are as large as they were in Egypt, or larger. The people of the Romagna have all the bearing and more than the size of the Roman soldiery. No feat is recorded as usual with Greek athletes which English acrobats could not now perform.

There is no naked savage tribe which naked Cornishmen or Yorkshiremen could not strangle. No race exists of which a thousand men similarly armed would defeat an English or German or Russian regiment of equal numbers. Nothing is recorded of our forefathers here in England which Englishmen could not do, unless it be some feats of archery, which were the result of long training of the eye, continued for generations.

The most civilized and luxurious family that ever existed—the European royal caste—is physically as big, as healthy, and as powerful as any people of whom we have any account that science can accept. Thiers' Frenchmen is Cæsar's Gaul in all bodily conditions, with an increased power of keeping alive, which may be partly owing to improved conditions of living, but is probably owing still more to developed vitality. There is no evidence that even the feeble races are feebler than they became after their first acclimitization.

The Bengalee was what we knew him twelve hundred years ago; and the Chinaman was represented on porcelain just as he is now before the birth of Christ. No race ever multiplied like the Anglo-Saxon, which has had no advantage of climate, and, till lately, no particular advantage of food. Physical condition depends on physical conditions; and why should a race better fed, better clothed and better housed than it ever was before, degenerate? Because it eats corn instead of berries? Compare the Californian and the Digger Indians. Because it wears clothes?

The wearing of clothes, if burdensome—which the experience of army doctors in India as to the best costume for marching makes excessively doubtful, they declaring, unanimously, that breechless men suffer from varicose veins, as men wearing trousers do not—must operate as a permanent physical training. You carry weight habitually. Because they keep indoors? Compare English professionals with Tasmanian savages, living in identically the same climate, but living out of doors.

The conditions of civilization not only do not prohibit Captain Webb, who would have outwalked, outswam, or strangled any German that Tacitus ever romanced about, but they enable him to live to seventy instead of dying at forty-five, as two thousand years ago, he, then probably a slave, bred for the arena, would have done.

That the human race, even under the best conditions, advances very little in physical capacities, is true; but then it is true, also, that those conditions are fatal to the most powerful of the old improving forces, the survival of the fittest. Still an advance is perceptible in vital power; and we question whether a Greek swimmer would ever have crossed from Dover to Calais just as strongly as we question whether the ancient world ever possessed a horse which would have achieved a place at Epsom. Why should men grow feeble in civilization any more than horses?

Floricultural.

A SIMPLE METHOD OF STRIKING CUTTINGS.

THERE is no time in the whole year better than the present for making and striking cuttings of shrubs, bedding or other plants of which we desire to increase our stock. The following is the simplest and most efficacious method we have ever tried. It is, in fact, so easily managed that we hope our young friends who have never thought of "striking cuttings" before, will give it a trial. By following our simple directions, and the means are within the reach of all, we are reasonably confident that their efforts will be crowned with a success that will encourage to further exertions in the gay and delightful field of floriculture.

A flower-pot eight inches in diameter answers as well as any other size, though of the two, a larger rather than a smaller is to be preferred. Place an inverted flower-pot saucer within the pot, of a size large enough to rest about midway or a little below. This serves the threefold purpose of (1) perfect drainage, of (2) affording a firm base for the sand, and of (3) dispensing with a greater body of sand than can be of any use. Of course other drainage material may be used if saucers are not at hand—but we prefer the saucer for the reason that it has given us better success. Aside from any philosophical causes as to its greater efficacy, its use is less trouble than to half fill the pot with broken crocks, stones, moss or what not; it is a cleaner method; the weight of the pot is less, and that it is more effectual in practice, will appear to others as it has to us upon giving both a fair comparative trial. When there is bottom heat, perfect drainage is of little moment, since the immense evaporation caused by the heat and shallowness of the boxes generally used, render it unnecessary. But without bottom heat, unless the drainage is perfect, the water very soon stagnates and the resulting acids cause the cuttings to damp off at once.

With the space in the pot beneath the inverted saucer empty, let us fill to the brim above with *coarse* sand, as coarse as is ever used for mortar—first sifting and washing it until thoroughly cleansed. Place it on a rack or stand in a window which receives the morning sun until noon and saturate it with water. Another saucer or some other vessel will be required to receive it as it passes through. We need not, as when flat boxes are employed, so much fear watering too much, because the water passes freely away and can never become "sour." It is only *necessary*, however, to preserve the sand constantly moist.

Our readers have, many of them, heard of the "saucer" plan of propagation, which merely consists of any saucer filled with sand and water, in which the cuttings are placed and given as much sun as possible. But the plan is a poor one, and we might better never attempt to root cuttings in this way of plants which are prized, for in most instances failure may be counted upon.

An eight-inch pot will accommodate twenty uttings. Make them from two to five inches long, depending, of course, upon what they are. At this season of the year more leaves may be permitted to remain upon them than earlier in the season, when the sun is higher and the air less cool and moist. Use a sharp knife, and make smooth cuts just beneath the joints or nodes—strip off the leaves nearly to the top and insert them about an inch in depth.

The development of new leaves or buds will generally indicate the proper formation of roots, when the cuttings are to be pricked out (for which purpose a teaspoon is very suitable) and planted in small pots of rich, sandy soil.

One of the greatest drawbacks to the thrifty growth of house plants is the use of clayey soil that, becoming hard—almost solid in fact, is impervious to both air and moisture. The plant *must* suffer, and all the doctoring in the land is not going to help it while thus strangled.

As to the number of leaves to be left upon a cutting, a little experience is required to determine. If too many are left, the cutting is exhausted and the formation of a callus (which is simply the healing over of the wound) and roots is retarded. If all the leaves are cut off or too few are left, the same effect is produced, though from a quite different cause. No better hint can be given than that the drooping of the leaves for any length of time after the cuttings have been inserted, is an indication that they have too many. Where a leaf is too large it may be cut in two, as in the case of *Aristolochia sipho* (the Dutchman's Pipe), *Hydrangea quercifolia*, etc.

Many soft-wooded and all other plants of which green cuttings are taken, are benefited by drying a few hours before insertion in sand. Thus a partial cicatrization occurs and the passage of the sap through the cut is interrupted.

Our readers will not ask us to give a list of the plants that may be propagated in the way we have described, because, among those generally used, either tender or hardy, for bedding purposes or for shrubberies, those that cannot be so propagated are the exception, not the rule.

RHEXIA VIRGINICA.

MEADOW BEAUTY is the familiar name of this. Our object in calling attention to it is to show how differently in this country and in England

the plant is estimated. It is blooming now, and may be found in most meadows throughout the country.

The stems are about two feet in height, for the most part unbranching. They are round, with four vertical foliaceous wings, which make them seem angular. The leaves, sharply-toothed and hairy, grow nearly perpendicularly, prominently three-reined, as shown in the cut. The anthers are long, tapering, of a golden-yellow color. The flower somewhat resembles *Geranium maculatum* in color and size, but it is very perishable, dropping off if touched. This, with the conspicuous urn-shaped calyx, is fairly shown in the engraving.

Of this plant which, strange to say, has never struck us as worthy of being introduced into the garden, the Journal of Horticulture (London) speaks as follows:—"Rhexia Virginica was introduced to our gardens as far back as 1759; the plants of this species require care and skill to cultivate them successfully. Rhexias are but little known and less cultivated, and are seldom met with. There are only four or five kinds enumerated in some of the best works we have, but they are a race of plants of great beauty and ought not to remain longer in the background. It requires time to get them established, and, except for increase, the plants should not be disturbed. They are summer-blooming plants of great beauty, and ought to be much more cultivated than they are at the present. When well grown and caught in condition, they would prove telling plants for exhibition purposes in collections of hardy herbaceous plants."

And the Garden praises it as follows: "*Rhexia Virginica*. This rare and beautiful perennial is now in blossom in the only nursery about London, where it grows freely—viz., OSBORN'S at Fulham. It is a little *Melastomaceous* plant that ventures far north over the American bogs.

EXCHANGE.

B. H. CRANE, Orleans, Neb.—I like your idea of exchange. I shall have, in their season, for exchange, seeds of *Euphorbia marginata* or Snow on the Mountains; *Verbena Montana* (perfectly hardy here) and *Negundo aceroides* or Box Elder.

Plants—*Schrankia uncinata* or Sensitive Brier; *Yucca angustifolia*; *Opuntia vulgaris* or Prickly Pear, and *Mammilaria macromeris*. I can also furnish the curious with seeds of *Solanum rostratum*, the plant on which the Colorado Beetle fed before he put himself on a potato diet. Not noted for beauty. The above are all wild. From my garden I can furnish Cannas and Tuberoses.

HYDRANGEA.

A GENUS of shrubby plants belonging to the natural order Saxifragaceæ, and natives of North America and Asia. This is an old and well-known family of plants, first brought to Europe from China in 1790, of very easy culture, requiring a deep, rich soil, delighting in a cool and partially shady situation, and, as its name indicates, in an almost unlimited supply of water.

Among the native species we have the *Hydrangea arborescens*, *quercifolia*, *radiata* and *canescens*, all desirable shrubs, blooming during June and July, and perfectly hardy. The most interesting species are, however, those introduced from China and Japan, the oldest and best-known of which is undoubtedly the Hydrangea hortensis, bearing large globular heads of rose-colored flowers, sometimes changing to blue, and equally well adapted for pot-culture or the open ground. If grown out-of-doors, it requires some slight protection during the winter months. [It is not hardy with protection.—ED.] A well-cultivated plant, under favorable circumstances, will produce hundreds of corymbs during one season. For decorative purposes we know of no better plant. Var. Imperatrice Eugenie is a beautiful plant, with tricolored petals of white, rose and blue. Var. Macrocephala, is of a delicate rose color, with very large individual flowers. Thunbergia flor. Persica is a very pretty dwarf-growing species, with peach-colored flowers, and a very free bloomer.

Otaksa is a variety producing immense trusses of rose-colored flowers in great profusion. The *Hydrangea paniculata grandiflora* is, however, the most magnificent of all, a shrub from eight to ten feet high—[*Hydrangea paniculata* will never attain the height of *eight* feet in this climate—nor have we ever seen a panicle 18 inches in length.—ED.]—with panicles of flowers from twelve to eighteen inches in length, at first of a pure white, gradually changing to a bright pink and rose color, retaining their beauty until destroyed by frost in December.

Single specimens, under good cultivation, will support a hundred large panicles of flowers, and planted in groups, produce a most gorgeous effect. Its profuse blooming, fine habit and perfect hardiness, makes it one of the most desirable flowering shrubs in cultivation. W. B. BERCHOLZ.

NOTES.

Lilium Krameri, of which a colored plate, is given in the London Garden, Aug. 12, was sent to England from Japan by Mr. KRAMER. It was at first thought to be a form of *L. auratum*, but it is now deemed distinct as well one of the most beautiful of Lilies. It is the size, judging by the plate, of a small *auratum*, but has no spots, and is of a delicate rose color, though in this it varies from white to purple. It will probably prove as hardy as other Japan Lilies.

I have had many opportunities of intercourse with cottage gardeners in various places, both in town and country, but I never yet knew one who truly loved his garden who frequented public-houses. The two are altogether antagonistic. When a man takes up with one he loses all taste for the other.—*E. Hobday in London Garden.*

Read the above twice, gentlemen—you who waver between the two and—take your choice.

It may be questioned whether any man ever truly loved his father, mother, wife or children who frequented "public-houses"—so difficult is it to "serve two masters." The RURAL'S advice is to one and all—Give the public-house a Cold Shoulder; love your family and—your Garden. There is no antagonism here.

Scientific and Useful.

WHERE THE HEAT COMES FROM.

AMONG the many "theories" advanced by scientists in regard to transmission of solar heat to this earth, the following from Dr. ADAM MILLER of Chicago appears to come nearer common sense and within the range of reason than any we have ever read:

The extraordinary hot weather we have endured for several weeks past may well excite an inquiry into the probable cause of the unusual range of the thermometer during this time.

According to the old and long-established theories, that the sun is an intensely-heated body, whose flames are supported by some combustible materials; or the more recent theory, that heat is a "mode of motion" produced by a contraction of the mass of the solar orb, and that heat produced by either of the above named theories is radiated from the sun to all the planets of the solar system, and that it diminishes as the square of the distance increases, we would be led to conclude that just at this time there is either an extra amount of meteoric matter falling upon the sun, or an unusual force of contraction going on in his substance, and consequently causing him to pour an unusual amount of heat upon our earth.

But, unfortunately for this theory of heat radiation from the sun, it is not true, notwithstanding the great names that have given it their support, and the ingenious arguments offered in its favor. What are the most plausible theories worth, when they are contradicted by plain stubborn facts in physical science?

Among the facts that confront the theory of heat radiation we may name the following:—1. The space between us and the sun is cold beyond any degree known to terrestrial inhabitants, and heat could not radiate through this cold space to our earth. 2. We are now about three millions of miles further from the sun than we were on the 21st of December. 3. Heat does not pass through distant space like light or sound, and has a very limited sphere for operation from its source. 4. If heat diminishes as the square of the distance increases from the inner to the outer planets, Mercury would be in a state of fusion, and the comets that have passed inside of the orbit of Mercury would have been dissipated into an invisible gas, and the outer planets and comets, in their passage from the sun, would be bound in perpetual chains of frost and ice—neither of which is the case. 5. It is not true that the aqueous vapour of our atmosphere absorbs much of the sun's heat before it reaches our earth; for the higher regions of our atmosphere are colder and increase in cold as you ascend from the earth's lower plane till you reach its highest mountains, where vegetation is impossible in consequence of perpetual frost and snow, even in tropical climates.

The cause of solar heat, then, must be looked for on a different principle from that of radiation from the central orb of our solar system. Heat is not an entity with an independent existence. It is dependent upon some cause, and may be produced by mechanical action, friction, or compression of material substances, or by chemical action. My theory is that heat is produced by the passage of the rays of light through our atmosphere, which is in the form of a concave-convex lens, and the different degrees of heat and cold are proportioned to the varying angle at which these beams from the sun pass through this refracting medium. The variation of temperature is caused by the different electrical conditions and the different degrees of density or rarity of the atmosphere at the same inclination of the earth to or from the sun. An artificial concavo-convex lens, resembling the form of the atmosphere, will give us positive proof of the variation of temperature with the different angles at which light passes through the lens. The seven different colors of the solar spectrum show the difference of refrangibility in the rays of light in proportion of 453 to 727 from extreme red to extreme violet in undulations, which indicate different chemical properties, and it is not unreasonable nor unphilosophical to conclude that heat will result from a crowding of these rays of light into a smaller compass by the action of the concavo-convex lens. If heat came to us by direct radiation from the sun, the obliquity of the rays of light in the winter in passing through the atmosphere would not increase their distance over the direct rays in a summer over 200 miles, and this does not sufficiently account for the difference of temperature between summer and winter, considering that we are, as already stated, three millions of miles nearer the sun in the winter than we are in the summer. We are, then, led to the conclusion that our solar heat is produced by the refraction of our atmosphere, and the dense and vaporous condition for some weeks past has increased this refracting power to an unusual extent, and this is the cause of our heated term.

WATERPROOF BLACKING.—Dissolve an ounce of borax in water, and in this dissolve gum shellac until it is the consistency of thin paste; add lampblack to color. This makes a cheap and excellent blacking for boots, giving them the polish of new leather. The shellac makes the boots or shoes almost entirely waterproof. Camphor dissolved in alcohol, added to the blacking, makes the leather more pliable and keeps it from cracking. This is sold at 50c. for a small bottle. By making it yourself, a dollar will buy materials for a gallon.

The Swine-Herd.

CALOMEL FOR HOG DISEASE.

CALOMEL was at one time supposed to be almost a specific for all the disease which "flesh is heir to," and while this remedial agent will probably never go out of use it has lost some of its popularity. We notice that a correspondent of the Southern Farmer recommends calomel for disease of swine and we give his experience.

Last fall I had a litter of eight choice pigs somewhat similarly attacked. They became scabby about the eyes and bones of the head, would eat mincingly, purge, cough, dwindle—and all died in from one to three weeks after the attacks, although I used various remedies, none of which seemed to have any good affect. Soon after these all died, one pig of another litter was attacked, and as an experiment I gave it about fifteen grains of calomel, and it got well immediately, and none of the others became affected. This spring, the same sow which lost all her pigs last fall, had another litter, and when a few weeks old they began with the bad symptoms, and two died before I thought of the calomel. I gave it to four others affected, and all got well. From these experiments and their success, I deem their publication worth the attention of the farmers. I notice the same disease prevails amongst pigs in Ohio and other localities, and I have great faith in calomel as a remedy, be the disease what it may.

Landscape Gardening.

HORTICULTURAL EDUCATION.

BY S. B. PARSONS.

In continuation of my remarks last week on "Horticultural Education,"—We will suppose that a man has bought his place and desires now to know what to do. The first thing is to put his ground in perfect order. The stumps of old trees should all be taken away, and all rocks reserved for creeping and climbing plants. Then get Allen's largest plow, with the requisite chains, put to it four yoke of strong oxen and plow twice in the same furrow. In this way you can thoroughly stir the soil to the depth of twenty and sometimes twenty-four inches. Then put on as much manure as you can afford and cross plow it again to the same depth.

The grounds are now ready, and your evergreen belt on the boundaries can be planted either between the first and middle of September, or in May. If planted before the autumnal rains, they will get well settled in the ground before winter. The best three trees for this purpose are Norway Spruce, White Pine and Austrian Pine. They all grow quickly and will make a screen quickly. This being done, other evergreens or deciduous trees can be planted either singly or in groups. Masses of shrubs can also be thrown in, care being taken to have the planting rather on the edges than in the middle of a lawn, and keeping open from the house a clear view of a broad expanse of turf. Of evergreen trees, the most desirable for general planting are the following, which I will describe in the order of their merit.

Abies excelsa or *Norway Spruce.*—There is no evergreen so well adapted as this for a variety of purposes. It bears transplanting better than any other, grows rapidly, has a drooping habit at all times, and is very beautiful in the spring when the young shoot, of two or three inches in length, droops down below the line of the older branch. Its color then is very delicate, and there is a soft, feathery richness about it which is very beautiful. It is excellent for a belt; it bears trimming well and makes a good hedge, while for grouping in threes and fives, it is unrivalled. Neither sun nor cold, drought nor moisture seems to affect it, and it is a tree which will always give satisfaction.

Abies canadensis or *Hemlock Spruce.*—This is a little shy of transplanting and, therefore, is not so valuable as the Norway Spruce. It is also somewhat impatient of the cold winds of winter. To guard against this, when small, it is well to plant on the North and West sides a screen of Norway Spruce five feet apart. These can be removed when the Hemlocks have grown sufficient to endure the wind. I have sown 800 feet of Hemlock belt on my own grounds, which have been so sheltered, and they are now the admiration of all who see them.

Those who have traveled in Northern New England, cannot have failed to notice the extreme beauty of the Hemlock when it has had room to develope. It is safe to assert that this is the most beautiful, coniferous, hardy tree yet known. It has none of the stiffness of its congeners; but is varied and picturesque in its outline, and preeminently graceful. It will bear cutting well, and is adapted to situations where a mass of trees is wanted, through which a view can be cut when they become too large.

It preserves a rich green throughout the winter, drooping gracefully over a smooth lawn; but in the spring and early summer is in the greatest perfection, when its young leaf-buds rest like flowers upon the rich darkness of the old foliage, reminding one of Raphael's picture of the young child resting his head against his mother's cheek. If planted two feet apart, and when two feet high, carefully trimmed for a few years, it will form a close hedge of great beauty.

Abies alba or *White Spruce* has the same general character as the Norway Spruce, but is more dwarf, more compact, and grows more slowly. A fine specimen is a beautiful object, and the glaucous tint of its foliage produces a striking effect. It is a tree which should be in every lawn.

Pinus Strobus or *White Pine* is an old and well-known evergreen. A native of Maine and other Northern districts. It is perfectly hardy. It grows with rapidity in any situation, and will make a thick screen quicker than any other tree. It has always been a favorite of mine, for near my father's house was planted one which I climbed when a child; and when a man, gave me pleasure by the musical sound of the wind among its branches—like the beating of waves upon a distant shore.

Pinus excelsa or *Bhotan Pine* is similar to the preceding in its general characteristics; but its longer leaves and light glaucous foliage give it a softer appearance. It is perfectly hardy, grows with great rapidity, and when sold, its abundance enables nurserymen to sell it at as low rates, it will be greatly preferred to White Pine. It is particularly adapted to situations where it is desired to obtain the effect of distance by the introduction of light foliage. In England, it is stated by some, to be the only evergreen which is thoroughly hardy against the winds which blow upon the sea coast.

Pinus Austriaca or *Austrian Pine* is valuable for its strong, robust habit, its rapid growth, and its persistent green, without any of the rusty hue which many evergreens assume in the winter. It is very valuable for belts or masses, and a single specimen, with room to spread, will attain great beauty. It is somewhat shy of transplanting, and requires care in removing.

Pinus sylvestris or *Scotch Fir* is like the above in general characteristics. Its points of difference are less robust branches, more glaucous foliage, and somewhat less rapidity of growth. Like the preceding, it is very hardy, and adapted to exposed situations. It also retains its color well in the winter.

Pinus cembra or *Siberian Stone Pine.*—This tree rarely grows more that 50 feet; but is close, compact, of fine color, hardy under any circumstances and very symmetrical. It is of slow growth, but its close foliage and symmetry make it one of the most beautiful evergreens. When properly appreciated, it will be always recognized as scarcely second to any in desirable qualities.

Around the Republic.

FROM OLD CONNECTICUT.

He who is born and bred in a city knows nothing of the delights the country imparts to those whose earlier recollections are of the fields and rocks, and trees and mountains, by which he was surrounded. And there are few who spend their early years in their native country town who entirely outgrow the impressions and influences its surroundings made upon them. A return, after years of absence, is only to renew acquaintance with natural objects, which, while they have been out of mind, have never been forgotten. True, the hills, down which in winter they used to guide their little sleds, seem not so high as they once were; and the rocks, from whose summit a leap was proof of great courage, have apparently sunk into the ground, or by the rains and frosts of years been worn to the dimensions of moderate-sized boulders; and the stream in which they sailed their little boats and fished for minnows with a pin-hook, can be erased with a step, they are all there still—the hills, the rocks and the stream—and a moment's reflection shows they have not changed. The trees, alone, have outgrown us. Little sprouts that could have been severed at a blow with a Barlow knife, are now trees giving shade and comfort; while those that were fully grown, are gone, passed away, as we shall soon pass, leaving our places for others. "Well," says George Eliot, "a human life, I think, should be well rooted in some spot of a native land where it may get the love of a tender kinship for the face of earth, for the labors men go forth to, for the sounds and accents that haunt it, for whatever will give that early home a familiar unmistakable difference amidst the future widening of knowledge."

That the general surroundings of a country life give to the young a more healthy moral tone than those of a city, is too generally acknowledged to require argument: and while we are too well aware that there is more than enough of sin and evil among all classes and conditions of people in the country, there is still more of fellow feeling and neighborly kindness than in cities. There are so few homes in the city, places to which one becomes really attached, from any thing there is about them in themselves, that the retention of only a very few becomes in any manner essential to our happiness. And those who, from choice or necessity, are frequently removing from one domicile to another, cannot gather around them the thousand little things that, valueless in themselves though they be, serve to give a feeling of home growth and permanence, while the continual change of habitation prevents the formation of those neighborly acquaintances which seem to add so much to the enjoyment of life, for can I believe that there is the same family love and attachments of children to parents, and to each other, when they are reared in the city?

But, perhaps, we are creatures of circumstances, or, as Dr. Draper would have it, of law; and where the tide takes us we must go, struggle and buffet with it as we may. Still, it seems proper that we should endeavor to choose that which we think the best for us, and, under all circumstances, to do that which we believe will serve to insure our own highest happiness, or to put it more laconically, look out for number one.

With this bit of moralizing, which seems to have pressed for utterance this morning, I will pass on to remark:

Riding about town considerably during a few days past, I have noticed that the crop of apples is not so good this season as in some years. The soil in the western portion of the township under the mountain is well adapted to fruit culture, and here apple trees seem quite full; but there is not a large crop. The Golden Sweet, which is a native of this vicinity, were abundant. They are gathered early in August, and sold this year for about one dollar per barrel. Pears seem to be growing in abundance, and, I am told, their culture is much easier and more certain than in former years.

Have you any theory to explain why, in the same location and apparently under the same circumstances, there seems to be times when, for a series of years, certain fruits will do well, and then for a long time all attempts at their cultivation be total failures? Twice, within my recollection, in this immediate vicinity, peaches, large and luscious, and almost without measure, could be raised with very little care. Several years intervened between these times, and since the last Peach Cycle, if I may so call it, it has seemed impossible to coax a tree into bearing.

There are those who hold that when the necessity for any change arises, a way for making it will be found out. Years ago much wood was taken from this township to feed the fires of the Connecticut river steamboats, which, together with the amount consumed for the ordinary purposes of cooking and eating, exhausts the forests quite as rapidly as growth renewed them. When railroads were built, a new demand for fuel was made. This, together with a constant increase in population, requiring a larger supply for domestic purposes, created quite an alarm, and the old farmers prophesied that in twenty years there would not be enough timber left for fencing purposes. But the fuel famine has not yet come. Steamboats and railroads no longer burn wood; and the hearthstones of our fathers have given place to ranges, grates and hot-air furnaces. Coal has, to a great extent, taken the place of wood for fuel, and, with the exception of large timber, which seems to have diminished—having been used for ship timber—there is probably as much growing here to-day as thirty years ago—at least its price in market has not increased out of proportion with other commodities.

Within sight from my window are three churches. They used to be called Meeting Houses—only the places of worship belonging to the Roman Catholics and their, as then thought, junior brothers, the Episcopalians, were called Churches—which belong respectively to the Congregationalists, the Methodists and the Baptists, and the congregations are usually numerically in the order named, filling only about one-third of the sittings provided. From a population of 1,500, scattered over 40 square miles, three large congregations could not be reasonably expected. The result is, neither society is well supported, the largest paying the minister but $1,000 a year (with promised donations). The worthy man who administers to the Methodists, subsists and supports a wife and six children on a salary of $800, and house free of rent; while the Baptists, few in number but fervent in faith, contribute still less to him who furnishes them with their spiritual sustenance. He preaches, and intelligent members of these churches will no doubt agree that there are no differences among them in point of doctrine so great as to necessarily defeat the main object, and that all worthy members will probably cast anchor alongside in the desired haven at last. If they could agree to unite, there would be one good congregation where there are now three small ones, and the amount of money expended by the three societies would, if used by them jointly, better serve to accomplish the ends all seem to have in view. If the people had three roads to their market town, when one could be made to accommodate them as well, rather than be to the expense of keeping the three in tolerable repair, it would not be long before two of them would be given up and the remaining one kept in first-rate condition. But man is a stubborn animal, as contrary as a pig, as mulish as a mule, and is sometimes blind to his own interests, both physical and spiritual.

Bloomfield, Conn.

The Vineyard.

SOME PROMISING NEW GRAPES.

Both cultivators and consumers of grapes have long felt the need of some really good light-colored sorts—something which would, in part at least, take the place of the exotic varieties generally raised under glass. The Anna Rebecca, Allen's Hybrid, and similar sorts, which were highly extolled years ago, have almost, if not entirely, passed out of cultivation, and we are still waiting to have their places occupied by better sorts of the same color. The Martha was a step in the right direction, coming of a hardy stock; but it failed to meet expectation, being inferior in quality and appearance, consequently it will probably be numbered among the superseded sorts. Next in promise came the "Lady"—a very handsome early white grape—seedling of Concord. We received specimens of this variety from Mr. Geo. W. Campbell of Delaware, O., last year, and again this, and we are well pleased with them, the samples showing earliness, large size of berry and good quality, which is certainly a promising outlook for this comparatively new grape. We also understand that the vine is hardy and the foliage tough enough to withstand mildew in ordinary seasons. The Lady grape, therefore, may be set down as promising well for general cultivation.

The Concord having become one of the most popular black varieties for general cultivation, numerous efforts have been made to raise from it a white sort possessing all the excellent properties of the parent, and while we are scarcely prepared to say that it has been accomplished, we can assert that some who have experimented in that direction have come very near obtaining the desired results. Among the promising white seedlings we have seen are several raised by the veteran ex-editor and pomologist, T. B. Miner of Lincoln, N. J. He has something like a dozen white sorts, all from the Concord and raised without any attempt at hybridizing or crossing with other species or varieties, which give promise of great excellence, not only in the quality of the fruit, but in the hardiness and vigorous growth of the vines.

Without attempting a description of either of these sorts, we will say that we had the pleasure of testing the light-colored varieties last year, and were highly pleased and somewhat surprised at their excellence, considering that they were of pure native blood. We shall have more to say of them when we find time to visit and inspect the original vines, but meantime will mention that one named the *Eugenie* was fully ripe this season on the 15th of August. It is one of the sweetest white grapes we have ever tasted. The *Pauline* is another excellent sort, ripening a few days later and coming nearer to being a *white* grape than most of those classed under this head. If these new white grapes raised by Mr. Miner from seed of the Concord do not fill a vacant niche, then appearance and quality of fruit are not to be considered trustworthy guides. Mr. M. has no vines of any sort for sale.

Domestic Economy.

ORIGINAL RECIPES.

Graham Gems.—I wish to give you my recipe for Graham Gems. I saw a recipe in the Rural, a few weeks since, for "nice" Graham Gems, which contained buttermilk, cream, molasses, soda, and I don't remember what else, and I said to myself: "Why will people take the most healthful article of food and fix it up in that way, making it very unwholesome, when it can be made so simply." I make mine simply of sweet milk and Graham flour; one cup of milk to one even cup of flour; if made thicker they will not be light. But if this rule is followed, and the oven and gem-pans are hot, they will be like mine, *light as a feather*, and much more delicious than when made with saleratus. They do not need salt.—Mrs. E. J. F., *Warren, Maine.*

[There is a great diversity of opinion in regard to what is or is not considered wholesome. For our part, we do not know why buttermilk, cream, molasses and soda should be any more unhealthy in "Graham Gems" than in cake, if they suit the palate better with these additions. What's the objection?—Ed.]

Crab-Apple Preserves.—Weigh the apples, and with an equal weight of refined sugar make a sirup; wipe the apples, and be sure to remove all of the calyx; prick them; put them into the sirup and boil till tender; when soft, take out and let them drain on a sieve; when cold, place them in jars; boil the sirup until quite thick, then pour over the fruit, and when cold, seal.

Crab-Apple Jelly.—Fill your preserving kettle with apples, then cover with water; boil until they are very soft; when cool enough, squeeze through a thin towel or coarse muslin. To each pint of the juice, add a half pound of loaf-sugar: return the juice to the fire and let it come to a boil before adding the sugar, then boil two or three minutes; pour off into glasses or bowls; when cold, lay fine white paper upon the jelly and fasten thick paper over the bowls with mucilage or paste. Quince jelly can be made in the same way.

Peach Marmalade.—The fruit should be finely flavored and thoroughly ripe, but perfectly sound; pare, remove the stones, weigh; put the peaches over the fire in a preserving kettle, and boil until very soft with a few of the kernels; stir them often to prevent burning; remove them from the fire, mash to a pulp, and add three-quarters of a pound of refined sugar to each pound of peaches; return to the fire and

boil briskly five minutes; skim carefully any scum that may rise. It should be a smooth paste. Put up in jelly glasses; lay soft paper over the marmalade, and seal up.

Sweet Pickled Pears.—To seven pounds of fruit, make a sirup of four pounds of sugar and one quart of vinegar; peel the pears, cut out the calyx, and stick cloves into them, say half an inch apart; boil the pears in the sirup until tender; take them out and drain on a sieve: when cool, place in jars; boil the sirup fifteen or twenty minutes longer, then pour over the fruit: when cold, fasten thick paper over the top.

MRS. RUSTIC.

Recipe for Canning Pumpkins Wanted.—EDS. RURAL: Will some of your lady readers of the Domestic department give me a recipe for canning pumpkin so it will be fresh in the winter or spring?—MRS. E. J. W.

[Will some of our lady readers respond and oblige.—ED.]

To "Anib."—To drive away ants—black or red—I sprinkle fine salt all over the pantry shelves, also occasionally wash them out with hot salt water. They hate salt as much as they love sugar. I have heard that tobacco dust is also very good for this purpose.

A wet sponge, sugared, will collect them, then throw it in hot water.—C. H. C.

Another.—My remedy for that pest, the "red ant," is kerosene. If they go in the cupboard, I rub it on the shelves. In a few days they will be gone, then you can wash up with hot soap-suds. You can rub kerosene on the outside of barrels or large jars. I, for one, think kerosene can be tolerated better than "red ants."—MRS. H. H. ANDREWS.

Hygienic Information.

MALARIA.*

The terms *malaria* and *miasm* in medicine include the causes of a large class of affections—what are known more particularly as *zymotic* diseases, which depend upon a variety of specific organic poisons whose essential nature, composition, and form, are mostly inappreciable as yet by scientific research. The general understanding, however, of these terms, is more limited; and, in conformity with the popular idea, I shall in the present paper confine their application to the cause of those wide-spread disorders, *intermittent* and *remittent* fevers—the former of which is so well known as "chills and fever" or "fever and ague."

"Time out of mind," as Watson remarks, "it had been matter of common observation that the inhabitants of wet and marshy situations were especially subject to these definite and unequivocal forms of disease." The same natural agencies which are now at work elaborating, evolving, and disseminating malaria must have been equally in operation ever since the surface of the earth assumed its present condition. Vast and remote wildernesses that have never known human presence teem, as of yore, with deadly exhalations that almost preclude the bold attempts of enterprising man to lay bare their secrets. There are some parts of India, as Bishop Heber informs us, which even monkeys and other wild animals instinctively desert between April and October of each year. The tigers go up to the hills; the antelopes and wild-hogs make incursions into the cultivated plains; and those persons, such as *dak-bearers* and military people, who are obliged to venture into the marshy jungles, agree that not so much as a bird can be heard or seen in the frightful solitude.

Taking the United States census of 1870 as a guide for our own country, we find malarial fevers forming a very important feature of the mortality-tables. They are most fatal in Florida, Louisiana and Texas. Next in order follow Arkansas, Mississippi, Alabama, Georgia, Missouri, Kansas and Nevada. In another group distinguished by a somewhat less mortality we find New Mexico, the Carolinas, Virginia, Tennessee, Kentucky, Illinois, and Indiana. Those States marked by the lowest mortality are the New England and Middle States, Wisconsin, and Minnesota. In California there is a considerable ratio of mortality, diminishing easterly in Utah, and northerly in Oregon and Washington Territory, while it augments largely toward the south in New Mexico. Since the census was taken, however, that is, since about 1869, there has been noticed an evident extension of the subtile miasmatic agency over regions previously exempt from it, in the Middle and New England States. The increase of mortality by this cause in New York City has been notable, but can scarcely be attributed entirely to local influences. In 1868 there were registered in this city only 98 deaths from malarial fevers. In 1869 they rose to 128; in 1870, to 213; in 1871, to 291; and in 1872, to 348; an increase of 350 per cent. in four years. Since then some diminution in their fatality has occurred. They occasioned 282 deaths in 1873, 295 in 1874, and 275 in 1875.

Let us now consider under what circumstances malaria may be produced. Although it cannot be denied that there are peculiar localities where, with apparently every presumed condition existing for the development of malaria, that poison is entirely absent, yet the concurrence of malarial emanations with such conditions in innumerable places establishes beyond a question their direct relation. The *essential* element in the production of malaria would appear to be *vegetable decomposition;* and, in order that this process shall ensue, the simultaneous operation of *air, moisture,* and *a certain high range of temperature,* is absolutely required. Localities, therefore, where such combination occurs, are prolific of malaria. Of this character are swamps and morasses, alluvial deposits, loose, porous, sandy, and argillaceous soils, or deep, loamy, marly lands underlaid by impermeable strata affording capacity for the retention of moisture, regions exposed to periodical or occasional inundation, places left bare by the subsidence of lakes or drying up of streams, and particularly areas subject to the intermingling of salt and fresh water—as salt-marshes into which fresh streams discharge, or regions liable to tidal overflow and recession.

The exhalations from marshy tracts are recognized by their effects upon the human system throughout the world; and the fact that marshes bear a causative relation to malaria has been demonstrated in numerous instances by the disappearance of fever after thorough drainage and cultivation, and its reappearance upon their being allowed to relapse into neglect. The favorable effect of drainage and cultivation is owing both to the systematic removal of water near the surface, and most probably also to the absorption by the growing crops of the products of organic decomposition. On the same principle Prof. Maury succeeded in antagonizing the noxious emanations from a marsh surrounding the observatory at Washington by planting it thickly with sunflowers, which seem to possess an extraordinary absorbing power. Sebastian is inclined to believe that the *Calamus aromaticus* which grows in some swamps has a similar neutralizing quality. Swamps covered with water are not so dangerous as those partially dry, the layer of water serving as a protection against the access of air and heat to the vegetable matter underneath.

A certain continuous range of temperature seems essential to the development of malaria, which is almost unknown beyond 60° north and 57° south latitude, and during the cold season in the temperate zone. [There are localities where intermitting fevers are even more common in winter than in summer in the temperate zone.—EDS.] According to Hirsch, it prevails up to various degrees of latitude and average annual temperature. It is the average summer temperature, however, that is of account, and the northern limit of this lies between the isotherms of 59° and 59.8° Fahr., giving a prolonged temperature sufficiently high to insure vegetable decomposition.

The alluvial soil along the banks of rivers and at their deltas, as those of the Ganges, Nile, Orinoco, and Mississippi, gives rise to fevers of a very malignant type. Their banks are subject to overflow, and frequently have a clayey subsoil, presenting an obstacle to percolation—thus upon the river's receding into its ordinary channel its banks remain damp below the surface, and disease is generated by the sun's agency. A like process annually takes place in the extensive plains and table-lands formed of alluvium washed down from mountain-ranges during the lapse of centuries, and having few actual marshes. Profuse rains, succeeded by dry hot seasons, render such regions exceedingly insalubrious during certain periods of the year. Somewhat similar in character are the oases of the Desert of Sahara, which abound in malaria. Hirsch describes these spots as consisting of trough-like depressions in a rocky or highly-hygroscopic soil, the receptacle of subterranean waters, and covered with a layer of alluvium, the surface of the oasis. In this the fierce heat of the sun causes cracks and deep rifts in the earth, which give free vent to the miasm evolved from beneath.

Localities subject to the intermixture of salt and fresh water are particularly prone to malaria. The Maremmas of Italy afford examples of this on a large scale. The Maremma of Lucca consists of three basins formerly dotted over with ponds and pools. It had been for centuries frequently overflowed by the sea-tides which intermingled with its fresh ponds. Malarial fevers ravaged it and rendered it almost uninhabitable. To the wayfarer who was so imprudent as to spend a night of August or September within its desolate bounds, the penalty was almost certain death. A remedy for this deplorable condition of things was long sought. A proposition had been made in 1714 by the engineer Rondelli to attempt the exclusion of the sea. Renewed in 1730 by Manfredi, and six years later by Zendrini, a mathematician of Bologna, the idea was finally carried into execution in 1740. The initial attempt was made upon the principal and most unhealthful basin. A sluice was constructed at the entrance of the canal of Burlamacca through which the waters of the sea penetrated into the basin to its central pond. The flood-gate was so arranged as to act like a valve, shutting by the pressure of the rising tide and opening when it fell. The success of this enterprise was so complete that in the following year the miasmatic diseases which had never failed to show themselves annually did not reappear, and the whole district was rendered salubrious. It was at this period that the village of Viarregio, previously abandoned and composed only of a few fishers' huts grouped at the foot of an old tower where galley-slaves were confined, became a place of fashionable resort during the summer for the aristocracy of Lucca. This fact of a region's being rendered healthy by the exclusion of sea-water is curious, but made more decisive still by its counter-proof. In 1768–'69 fevers suddenly sprang up again as bad as ever in the same territory. Upon the cause being investigated, it was found that the sluice had become deranged and the mixture of waters had been re-established. Upon the flood-gate being repaired, the malaria was again extinguished. The same occurrence happened in 1784–'85. The sluice having been neglected, there took place in 1784, out of a population of 1,900, the enormous number of 1,200 cases of malarial fever and 92 deaths. In the following year there occurred 103 deaths. The trouble was remedied in the same manner as before. The other portions of the Maremma were rendered healthy later, by sluices successively established at different points. Such a remarkable result necessarily attracted public attention. Leopold II., Grand-duke of Tuscany, was particularly impressed by it, and he conceived the great idea of improving the whole Tuscan Maremma in the same manner. It was an immense undertaking which he contemplated—an actual transformation of a large part of his dominions—and it redounds to his glory that he succeeded, in the face of almost insurmountable obstacles, by the means described, and a properly-directed system of canalization and field-culture, in regenerating a very considerable portion of his territory.

It is not difficult to account for the generation of malaria under such circumstances as those just mentioned. The minute forms of vegetable life with which both fresh and salt water teem require their own special element for continued existence. The intermixture of salt with fresh water introduces a new element with which the life maintained in each separately is incompatible. The surface of the soil consequently after every invasion and retirement of the tide exposes to the action of the heat a mass of defunct vegetable material spread out over an extensive area, and in most favorable condition for speedy decomposition.

Besides the localities enumerated, malaria is apt to be induced or intensified in a region wholly or comparatively exempt from it before, during the disturbance of large extents of soil, as in the construction of canals, roads, railways, fortifications and dikes, rooting out of timber, preparation of virgin land for cultivation, etc. Vegetable organisms previously hidden and protected underground are thus brought to the surface and exposed to the agencies of putrefaction. Laborers engaged in such works and the neighboring inhabitants soon suffer. The "polders" of Holland, those parts reclaimed from the sea by the erection of dikes, are of this character, and the workmen engaged on them are attacked with malarial troubles of great severity. In this country such instances are common. We have an example at our very doors in the increase of malarial fevers which accompanied the opening of the new boulevards, and the engineering excavations of the Harlem Railroad. After such works have been completed, however, it is not unusual for the vicinity to be restored to healthfulness.

It must be acknowledged that occasionally miasmatic fevers appear and disappear without there having occurred any perceptible changes in the relations of the soil. Such circumstances were reported to the Pennsylvania State Medical Society as having been noticed in 1856 along the Juniata River. Reports to the Connecticut State Medical Society also mention the appearance of miasmatic disorders without any recognized cause in portions of the State previously exempt from them.

An impeded outflow which raises the level of the ground-water has been productive of an immense spread of paroxysmal fevers. Demster, Taylor and Ferguson, have reported such to have been the case in portions of India. The severe and fatal fevers prevailing in Burdowan, Lower Bengal, during the last fifteen or twenty years, have been coincident with obstruction to the natural drainage from mills, and blockage of water-courses. The same cause has doubtless operated to a great extent in producing the fevers of Bloomingdale, Manhattanville, Yorkville and Harlem. The establishment during the past five years of extensive subsoil drains in those portions of New York has had a visible tendency to diminish the area of malaria. A similar result on a large scale has been noticed in Lincolnshire and other parts of England, where many malarious tracts have been rendered quite healthy by similar measures, having for their object the lowering of the subsoil water-level by an increased outflow.

With regard to the question, "Can drinking-water act as a vehicle for the introduction of malaria into the animal system?" *a priori* it seems reasonable to suppose that such may be the case. If malaria, be it a gaseous substance or an accumulation of minute organisms, cannot pollute water, it differs essentially from other materials of similar form with which we are better acquainted. But, in fact, we have positive proof that malarial fevers may be due to drinking impure water. In 1834 there returned to Marseilles from Bona in the ship Argo 120 soldiers, of whom 103 were seized with various forms of malarial fever after drinking marsh-water taken on board at Bona. On the other hand, the sailors of the same vessel, who had pure water, and 780 men embarked on two other vessels, remained well. The few soldiers on the Argo not attacked had purchased their drinking water from the sailors. Against such positive evidence as this the statement of Finke that in Hungary and Holland marsh-water is drunk without injury is of little value.

The stratum of air overlying typical malarial marshes has been examined with particular care. It has been found to contain an excess of carbonic acid—watery vapor in large quantity—often carburetted hydrogen, and occasionally free hydrogen, ammonia, and phosphuretted hydrogen. If the marsh contains sulphates, sulphuretted hydrogen is present. Its organic matter blackens sulphuric acid—gives a reddish color to nitrate of silver—has a flocculent appearance, a peculiar odor, and affords evidence of ammonia. These various examinations, though interesting, bring us no nearer to a solution of the question, *What is the nature of malaria?* All of the many substances and forms thus far observed in malarial localities may be found equally in districts perfectly salubrious.

That it gains access to the system principally through the respiratory organs is quite certain. What we really do know of it has reference more particularly to its mode of action. It is most dangerous when the sun is down, and it seems almost inert during the day. It appears providential that the same agency which is so potent in its production should be the principal instrument of its destruction. It loves the ground, where in many regions it is so concentrated and deadly as to destroy the incautious sleeper on the earth almost as quickly as the most noxious gas. Hence it is generally regarded as having a specific gravity heavier than that of air, but this is by no means certain. It is doubtless rendered heavy by combining with night-fogs and dews, but upon their being dissipated by the sun it rises into the air and probably becomes innocuous by wide diffusion and dilution. It is intercepted by impediments, such as walls and groves of leafy trees, which obstruct the winds that bear it. Perhaps the latter also neutralize it by absorption. It is likewise neutralized and probably absorbed in passing over a considerable body of water—especially salt water. The distance necessary to effect this result naturally varies with circumstances—force of winds, concentration, intensity, and abundance of the poison itself. According to Blanc, in the channel between Bevoland and Walcheren, 3,000 feet of water rendered it inert. In China, three-quarters of a mile, and in the West Indies, one mile, have been required to be effectual.

Recognizing the facts mentioned, the precautions to be observed against malaria are quite obvious. In built-up cities we are protected by pavements and sewers to a great extent, and probably also by the character of the atmosphere, which is artificially warmed by radiation at night, and impregnated with gases, which, though injurious in other ways, are antagonistic to malarial emanations. But in malarial suburban and country districts it is otherwise. There certain precautions are necessary. If possible, elevation of a dwelling place, at least 500 feet above the source of the miasm, is to be recommended in temperate climates, and from 1,500 to 2,000 feet in the tropics. If this be not practicable, thorough subsoil drainage, filling up of low and moist grounds, covering the earth with closely-cut herbage, belts of umbrageous trees interposed between the dwelling and the point of danger, but at a sufficient distance to permit free ventilation, and the access of sunlight; doors and windows opening principally away from the malarial quarter; the house, if possible, to be raised on pillars or arches a few feet above the ground, otherwise a sub-cellar thoroughly cemented—all these are measures of primary importance. The sleeping apartments should not be below the second story, and should be provided with open fireplaces in which on damp or chilly nights a little fire may be kindled. Exposure to the open air after sunset, or until several hours after sunrise, should be avoided. As whatever tends to lower the vital powers predisposes the individual to malarial invasion, personal hygiene is indispensable. It should of course be dictated by common sense, with the object of establishing and maintaining, in the words of the old maxim of the sanitarian, *mens sana in corpore sano.*

SATURDAY, SEPT. 9, 1876.

DO NOT DECEIVE YOURSELF.

It is claimed, and doubtless with truth, that the chief reason why the Chinese have remained so far behind Europeans in the fine arts and higher branches of science, is the consummate vanity they possess, which induces them to look with contempt upon the real knowledge of every other nation. The ignorant pretender thinks he understands everything that comes in his way, while our greatest philosophers know that their ignorance outweighs all their accumulated knowledge. LOCKE's advice on this point is worth repeating and remembering: "Our knowledge being so narrow, it will perhaps give us some light into the present state of our minds if we look a little into the dark side and take a view of our ignorance which, being infinitely greater than our knowledge, may serve to the quieting of disputes and improvement of useful knowledge."

Now would not this be a good lesson to learn and heed in relation to all matters pertaining to rural pursuits? for it is just possible that a man who thinks he knows all about certain breeds of animals or kinds of fruits, grain or vegetables, has yet something to learn, and is deceiving himself by refusing to investigate or to look upon the opposite side to that upon which he has been wont to gaze. It is certainly surprising to note how tenaciously a person will cling to an error after it has been shown to be such, if a change is likely to interfere with his pleasures or profits.

As a familiar example of how some persons deceive themselves, we may mention the manufacture of what are termed home-made wines. It matters little what they are made of—whether grapes, gooseberries, currants or elderberries—the principles are all the same and the results vary only in degree, some being stronger than others. Such beverages are almost as common and popular among country folk as the higher-priced wines are among the residents of our larger cities and, for aught we know, just as good and wholesome; but the objective point is that thousands of persons deceive themselves into believing that they do not contain any intoxicating properties—in other words, that they are really pure and free from alcohol. Many a time have we heard the good farmer or his wife say, this currant, or other "home-made" wine, is "pure, and does not contain a drop of spirits, for I made it myself."

Now the persons making such statements may be perfectly honest and truthful to the extent of their knowledge of the facts of the case, and yet at the same time they are grievously deceived in supposing such home-made beverages contain no intoxicating properties. Cane-sugar through fermentation, produces rum at the rate of about one pint to a pound, and it makes little difference whether fermented in connection with elderberry, currant, or the juice of any other fruit, the rum is in the mixture, however well it may be disguised to the palate. The effect upon the human system is the same as though drank in its pure state or diluted with water.

Many a sample of good, generous currant wine, contains twenty per cent. of alcohol or New England rum, although not a drop of anything was added to the juice but "three or four pounds of sugar;" consequently, every time one drinks a glass of it he takes one-fifth of a glass of rum. For our own part, we could never understand wherein there was any difference, morally, between offering a friend a glass of home-made or other wine and a glass of rum, whisky or brandy, except one's vanity may be tickled and the rum deceit give zest to flavor. Would not it be more honest and manly to offer the pure undisguised article than the deceptive one, and would not the young men and women be far more likely to reject the rum than the wine, and thereby never acquire the taste for strong drink? Are not fathers and mothers deceiving themselves in this wine making business, owing to an indisposition to look on the dark side taking, as LOCKE says, a view of our ignorance? Let us be honest with ourselves in such matters and not permit vanity and conceit to get the better of our judgment, and thereby shut out the light which is freely offered to those who should be capable of receiving it.

LOCAL VALUE OF THINGS.

THE stubbornness of mankind is probably exhibited more conspicuously in the unwillingness to admit that a thing may be of great value to one person and quite worthless to another. Or, to express the idea in other words, a thing may have a local value far above its general worth.

The ignoring of this fact is frequently the cause of much bickering among individuals and nations and of more or less unhappiness generally. But we have no need to go far away from home to find abundant examples of this local valuation of things important and unimportant.

A dog may, under certain circumstances, be actually worth to his owner more than a first-rate horse or a half dozen cows. Still, few other persons could be induced to take the animal as a gift; but the arbitrary ruling of a statute law would, perhaps, ignore any individual or local valuation.

Certain breeds of farm stock are known to be far more valuable in particular localities than others, depending upon local circumstances, of which those residing outside of what may be a circumscribed region of country can know little, and still the latter are generally ready to express an opinion as to the folly of the former in placing a value upon their own property.

Fast horses with records of 2.20 or less, may be in demand among a certain class of men; but of what earthly use are they to those who have work to do on a farm in the way of plowing or hauling loads to market? It is an old saying, that "A thing is worth what it will fetch in market, and no more;" but there are many exceptions to this rule, and the local value of things in general come under this head. The camel may be a very useful animal in Africa and the elephant in India; but who, in this country, could be induced to take either and keep it for use or ornament?

This same principle holds good in all the various phases of rural life. The apple, pear, peach, grape or other fruit which may prove to be of inestimable value in one state or location, may be almost worthless in another. Of course, we are not to believe that the old Pound pear is as sweet and delicious in California as the Seckel is in New York—no matter who or how many persons might make such a claim for it. Still, if the Pound pear is found to succeed where the Seckel does not, then we would be bound to own that it was the most valuable of the two sorts, for a certain locality or under certain conditions. We may feel like pitying a person who is compelled to eat Scuppernong and Fox grapes because he cannot raise Delawares or Ionas; but the circumstances may be such that the former are more valuable, locally, than the latter. There is, however, no need of pursuing this subject further, as the man using his reasoning powers will readily perceive how absurd it is in him to place a valuation upon things of which he must necessarily know little or nothing.

RAILROAD RISKS.

IT is stated that JOHN BRIGHT once said that the safest place in which a man could put himself was inside a first-class railway car. This, perhaps, is not absolutely true, but it is much nearer the truth than might at first be supposed. We do not realize the immense number of people who ride in cars nor the number of miles traveled.

The last report to the Massachusetts Legislature relative to the railroads in that State, contains much valuable and interesting information, some of which has been used by CHAS. FRANCIS ADAMS, Jr., in the preparation of articles published in the Atlantic Monthly. From this source we learn that in proportion to the number carried the accidents to passengers in the "good old days of stage coaches" in France during forty years, were, as compared to those of the present time on railroads, as sixty to one. Adjusting the stage risks in France to the modern travel of Massachusetts, eighty passengers should be killed and eleven hundred wounded every year by railroad travel in that State, which is fifty times more than the actual average. More were killed and wounded in Massachusetts fifty years ago by stage travel than at present on railroads.

It must be remembered that these remarks refer only to those who are subjects of accidents which are entirely beyond their control. Deaths or injuries arising from carelessness or inattention of the sufferers are not considered. Employees of railroads become so accustomed to being in places of danger as to take risks that are entirely unnecessary; and people will persist in walking on and driving across tracks without regard to the repeated warnings, and if the result of their acts be suffering or death, it is not properly chargeable to the railroad system.

During the fifteen years from 1861 to 1874, inclusive, there were 350,000,000 passengers carried by railroads in Massachusetts, of which thirty-nine were killed and two hundred and fifty injured—or less than one in each 8,900,000 killed and one in 14,000,000 injured. For each death 115,000,000 miles were traveled, and for each death and injury not resulting in death, more than 18,000,000 miles.

During the four years, 1872–75, 130,000,000 of passengers journeys over 1,700,000,000 miles of railroad were made within the limits of the State, in which only one person was killed and but forty-two injured. With the same risk, if a person was born upon a railroad car and traveled five hundred miles a day, he would be about two hundred and twenty years old before meeting with an accident involving any personal injury.

In comparison with the above facts, Mr. ADAMS goes on to state that during the year 1874, in Boston alone, fifteen persons were killed by falling down stairs, twelve by falling out of windows, fourteen burned to death, and seventeen by having been run over in the streets.

We take pleasure in presenting the above statistics to our readers, because many whose duties are principally near their homes, in the shock given them by reading some railroad accident, forget to what extent travel is made, and we know further that many of these people when they do take a seat in a car of the best-conducted road, suffer intensely from a nervous fear during the whole of their journey. Facts, like the above and a little thoughtful consideration thereof, may do much to allay such apprehensions.

RURAL NOTES.

Georgia State Hort. Soc.—On the 16th and 17th August, it was my pleasure to attend a Convention of Horticulturists in the city of Macon and during these days we perfected the organization of the Georgia State Horticultural Society upon a firm, satisfactory basis. P. J. BERCKMANS, President, Augusta; J. S. NEWMAN, Sec'y, Atlanta. Besides garden products, many of which were very fine, we had on exhibition over 300 plates of fruit, comprising 40 varieties of apples, 35 of pears, 25 of peaches, 25 of grapes, 6 of plums—many of which were quite creditable. In view of the lateness of the season, the general failure of our best fruits, the very short notice of the meeting, the exhibition was regarded as an unlooked-for-success. President BERCKMANS delivered an address, a copy of which I inclose. You will be pleased with it, I trust. I also inclose a copy of the second day's proceedings, except the report on exhibition of fruits and vegetables.—J. J. TOON. [We are always pleased to hear of the formation of new Industrial Societies, and especially Horticultural and Agricultural.—ED. RURAL.

A Word from Advertisers.—Advertisers rarely give, voluntarily, such flattering testimony as is contained in the letters below. It is very gratifying to the management of this journal to know that our advertising columns are such a true index of the wants of our subscribers:

NEW YORK, Aug. 28, 1876.

GENTLEMEN:—We have advertised in your paper for upwards of six years, and during that time we received more letters and applications for the celebrated Borel & Courvoisier Watches from persons and dealers who wrote and informed us that it was by having seen the advertisement in RURAL NEW-YORKER, than in any other journal. We are free to say that our advertisement in your paper paid us better than any other medium we employed. We shall advertise in the RURAL again this fall and winter, and hope that it will lead the van as formerly. Yours,
QUINCHE & KRUGLER.

RANDOLPH, N. Y., Aug. 28, 1876.

GENTLEMEN:—Inclosed find check for our bill for advertising in the RURAL NEW-YORKER. Please acknowledge receipt of same and oblige. We are well pleased with the investment and will patronize your paper another year. Respectfully yours, WILLARD & HAMMOND,
M'f'rs. of Champion Milk Pan and Cooler.

RURAL BREVITIES.

THE oyster shell bark louse, which is so common upon apple trees in the Eastern States, has made its appearance in California upon pear trees.

FARMERS residing in the "Burnt districts" of the East this season, should sow rye this fall for early spring pasture, as the grass is likely, from present indications, to be exceeding short and thin next season.

THE Grangers of California are again shipping their wheat direct to Eastern markets in vessels chartered for the purpose, thereby taking all the risks themselves and saving the middleman's commissions.

PARTIES desiring trees, plants or bulbs, are referred to ELLWANGER & BARRY's advertisement, now appearing in our columns. Their establishment is recognized as one of the largest and most reliable in the United States.

SMALL hogs of from 200 to 300 pounds' weight command a better price in English markets than larger ones; which certainly shows that the pork eaters on the other side of the Atlantic know the difference between a coarse and fine-grained article.

IF the Judges at the Centennial Exhibition on Live Stock and other Agricultural and Horticultural products are not fitted for the positions they hold, the Chief of the Agricultural Bureau should not be held responsible, but the old "Fogys" among the Commission.

THE South publishes a long and labored article to prove that white men *can* labor in hot climates with as little inconvenience and injury to health as the negroes, thereby assuming what few have ever denied; but the most important question to be answered is, "Will they? or do they?"

THE manufacture of a tobacco sheep wash is carried on quite extensively in Liverpool, Eng., and it is said one company has boiled down more than a ton per day. Into the tobacco water is put sulphate of copper, turpentine and salt, the mixture being employed for destroying scab on sheep; but gardeners use it as a general insecticide.

CALIFORNIANS are talking of opium-poppy culture in the State and thereby supplying the Chinese population with the home-grown article. The only question to be settled in connection with the production of opium anywhere in this country, is whether labor can be had sufficiently cheap to enable the producer to compete with other nations.

AIR CASTLES.

CASTLES in air,
Castles in Spain,
Dream-mansions fair,
Over again
Build we in youth
Only to see
Turret and wall
Crumble—Ah, me!

Dreams of the past
Too fair and bright,
Aye, sweet to last,
Haunt me to-night—
Pale ghosts of dreams
Cherished how long?
Till Youth's young May
Died like a song?

Four precious ships
Sent o'er life's main,
Love, Wealth and Fame,
Ne'er came again.
Only one ship
From that lone sea,
Freighted with Faith
Came home to me.

Moored in Hope's bay,
Anchors made fast,
On Christ, my stay,
Peace—*rest*, at last.
Argosies fair
Laden with gold,
Never can buy
Christ's love untold.

[*Emma May Buckingham.*

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 157.]

THE TERRITORY NORTHWEST OF THE OHIO was in 1787 erected into a District, with a Governor, Legislative Council and House of Representatives. The act of Congress provided for the formation from this Territory of three and not more than five, States. The Western State to be bounded by the Mississippi, the Ohio and the Wabash Rivers, and a line due north from Post Vincent on the Wabash to the Territorial line, thence by said line to Lake of the Woods and Mississippi River; the Middle State to be bounded by said direct line, and the Wabash from Post Vincent to the Ohio River, by the Ohio, by a meridian line from the mouth of the Great Miami to the Territorial line, and thence west on said line. The Eastern State to be bounded by the last-named direct north and south line, the Ohio River, Pennsylvania and the Territorial line—reserving the right, if Congress pleased, to form one or two States in that part of said territory which lies north of an east and west line drawn through the southerly bend or extreme of Lake Michigan; and providing that when either of these Districts should have a population of 60,000, it might apply for admission to the Union. It was further provided that neither slavery nor involuntary servitude (except for crime) should exist in this Territory; but also providing that slaves escaping and found within the Territorial limits should be returned. The population of this section increased rapidly.

In 1796 Wayne County was established, embracing what is now Northwest Ohio, a large tract in Northeast Indiana, and all of the Lower Peninsula of Michigan. In 1799 there were 5,000 free male inhabitants and eight organized counties. A Territorial Government was adopted and WILLIAM HENRY HARRISON elected the first Delegate to Congress.

In 1801 the Territory was divided into two Governments by a line from the mouth of the Kentucky to Fort Recovery, and thence north to Territorial line. East of this line the Government already established was continued. The Territory was named Ohio, (the beautiful,) with the seat of Government at Chillicothe. West of the line a similar Government was established, embracing all of the northwest except Ohio, and the Territory named Indiana.

DISTRICT OF COLUMBIA.

Previous to the adoption of the Federal Constitution the Congress had no stated place of meeting. Sessions were held at New York, Trenton, Annapolis, Philadelphia, Baltimore, Lancaster, York, and Princeton. It became evident that a permanent place of meeting should be selected and suitable buildings erected, not only for the sessions of Congress but for the offices of the various departments of Government, and that this place should be under the jurisdiction of the Federal Government and not subject to the control of any State. With this end in view an article in the Constitution provided that Congress should have power "To exercise exclusive legislation over such district (not exceeding ten miles square) as may by cession of particular States and the acceptance of Congress, become the seat of Government of the United States."

In 1789 the question of location was discussed, and it was agreed that it should be situated with reference to the center of wealth, population and territory, having also in view ease of access by navigable waters and a due regard to the situation of the Western country. Various places were named, among which were Philadelphia, Germantown, New York, Harrisburg, Wright's Ferry, (on the Susquehanna, thirty miles above the head of navigation,) Peach Blossom, (ten miles lower down,) Wilmington and Baltimore. Southern members favored a location to be selected on the Potomac, and preferring the present site of Washington—then called "Connogocheague." Pennsylvania offered to give $100,000 toward the erection of buildings if located in that State. Delaware, Maryland and Virginia each agreed to surrender right of jurisdiction to the required land should a location within their boundary be chosen.

Considerable discussion was had in which much sectional feeling was exhibited, but no decision was arrived at until July, 1790. At that time the Assumption bill was pending in Congress. This bill provided for the assumption by the General Government of the debts incurred by the several States during and for the prosecution of the war. It was warmly supported by most of the Northern members and by those from South Carolina who represented the States most to be benefited by its passage, but who were in a minority. At length, two of the "Potomac" members, so-called, agreed to change their votes and support the Assumption bill if, in consideration thereof, enough "Assumption" members would vote to locate the seat of Government on the Potomac as to secure a majority therefor. This was done and both bills were passed—the latter, however, with the agreement that Congress should continue to meet in Philadelphia until 1800, that time being supposed necessary for the selection of a proper situation and the erection of suitable buildings thereon.

OHIO.

In 1802 Ohio was admitted as a State. The Constitution and ordinance of admission, containing a proviso that if the north line of the State as determined by the ordinance of 1787 should not be so far north as the north cape of Maumee Bay, then the north line of Ohio should be a line drawn from the south end of Lake Michigan to said north cape of Maumee Bay. This was done to include Toledo, the best harbor of Lake Erie, and gave Ohio the strip of territory adjoining Michigan, with an average length of eighty miles and six miles wide, and a triangular tract in the northeast corner of the State embracing 700 square miles—all north of the line of 1787.

In connection with the early history of Ohio an incident occurred that shows what great results are sometimes produced by trivial causes. In 1788 or soon after, Judge SYMMES established himself with quite a colony at North Bend, on the Ohio, about fifteen miles below Cincinnati. Here he laid out a spacious city, to which he gave his name. About this time a detachment of troops were sent, with orders to erect a fort between the Miamis. Influenced probably by the Judge, they halted at North Bend and commenced their search for the best site for the fortification. Unfortunately for the Judge, the officer in command met and immediately became enamored with a beautiful black-eyed woman, wife of one of the settlers. The husband being a man of peace and apparently aware of the powers of the sons of MARS over the average woman, with great discretion retreated, abandoned the locality and removed all his household gods, wife included, further up the river, where he supposed he could rest securely at Cincinnati. North Bend immediately lost all charms for the gallant officer. No place suitable for a fort could be found and, beside, as he reported to the Judge, he thought the fortress should be located nearer midway between the two rivers and, at any rate, he would commence no building before examining further up. So the troops were put in marching order and moved up the river. An admirable location was found at Cincinnati and the erection of Fort Washington was forthwith commenced. The settlers at North Bend followed the troops, and thus the pretty face of a woman was the means of transferring the site of the commercial emporium of Ohio from the place where it was first established to the location it now occupies.

It is to be regretted that history records no further facts relative to the lady. But perhaps it is better so. You of imaginative minds may from this beginning work out a romance to your liking. Choosing your plot for yourselves, you may make of it Tragedy, Comedy or Farce, as you will.

LOUISIANA.

The French were never satisfied with the transfer in 1762 of their possessions in America to Spain and had never lost sight of their countrymen subjected to Spanish rule; and now Spain, having become involved in the European war, was obliged to yield to the wishes of the French and NAPOLEON determined to restore to France her ancient dominion in Louisiana and after negotiation, by treaty confirmed in 1801, Spain ceded to France the territory with the same extent it had when before in possession of France. In return, NAPOLEON promised to settle upon the Duke of Parma, son-in-law of the Spanish King, the sovereignty of the kingdom of Tuscany, with the title, "King of Etruria."

NAPOLEON made great preparations to take possession. A force of 25,000 men was collected and a fleet made ready to take them to America. But

"The best laid plans of mice and men
Gang aft agley."

The English were not entirely satisfied that the destination of this force was America and, as a matter of prudence, concentrated a powerful fleet in the British Channel, effectually checking the project of the French. Then NAPOLEON began to fear that so soon as Louisiana was again declared a French Province, this fleet of the English would at once sail for the Mississippi, blockade all entrance, and taking possession, proceed to conquer and occupy it. He could, as then circumstanced, ill afford to spare men and means to protect it, and much as it hurt his pride and ambition, he determined to sell the whole territory to the United States before his enemies should wrest it from him, thus weakening England by strengthening America. Both parties being desirous of consummating the arrangement, terms were soon agreed upon, and in 1803 a treaty was signed by the agents of each power by which, in consideration of $10,000,000 to be paid to France and $5,000,000 to be paid to American citizens in discharge of claims against France for spoliations and an agreement to submit to the ceded territory all goods duty free for twelve years, NAPOLEON obligated France to give possession in six months.

Spain was indignant at the transfer and claimed that by the deed of cession from Spain to France, it was agreed that the territory should never be alienated from France. This matter was, however, amicably settled, and in November 30, 1803, Spain made formal delivery to France, the French flag was raised and for a few days the country was again under French rule; but on the delivery of the country to the United States December 20, 1803, the tri-color slowly descended, meeting the Stars and Stripes at half-mast. When the sale was completed BONAPARTE is said to have remarked that by that act the power of the United States was forever established, and that England had now a rival that would sooner or later dispute her supremacy on the sea and humble her pride.

The purchase of Louisiana more than doubled the area of the United States, and settled forever the vexed question of the navigation of the Mississippi. Amicable relations could not have been long sustained with any nation holding possession of New Orleans and the Delta of the Mississippi. Nor would entire harmony have been possible with with any trans-Mississippi Government. What this country now is is owing largely to this territorial acquisition; and this was consequent, in large degree, to the clearness of foresight, soundness of judgment and energy of prosecution, of that Democratic-Republican, than whom, in his time or ours, none has lived wiser or better —THOMAS JEFFERSON.

ORLEANS.—In 1804 Congress erected the whole area purchased from France into two Governments. All south of Mississippi Territory and a line commencing at the Mississippi River and running on parallel 33° to the west bound of the country ceded by France, was named the District of Orleans. The form of Government was similar to that of the Northwest Territory, having such modifications as were required to adapt it to population of a foreign origin.

LOUISIANA.—In 1812 Orleans—after much discussion as to the constitutionality of making States from acquired territory—was admitted to the Union and named Louisiana; and the territory lately bearing that name was called the Missouri Territory. Shortly after Congress extended the limits of the State to embrace the Florida Parishes, giving boundaries as at present—Pearl River on the east and Iberville's line (so-called) on the north.—[To be continued.

The Story-Teller.

A SPECIAL CONSTABLE.

BY CHARLES READE.

Two women, sisters, kept the toll-bar at a village in Yorkshire. It stood apart from the village and they often felt uneasy at night, being lone women.

One day they received a considerable sum of money bequeathed to them by a relation, and that set their simple souls all in a flutter.

They had a friend in the village, the blacksmith's wife: so they went and told her their fears. She admitted that theirs was a lonesome place and she would not live there, for one, without a man. Her discourse sent them home downright miserable.

The blacksmith's wife told her husband all about it when he came home for his dinner.

"The fools!" said he, "how is anybody to know they have got brass in the house?"

"Well," said the wife, "they made no secret about it to me; you need not go for to tell it to all the town—poor souls!"

"Not I," said the man; but they will publish it, never fear; leave women folks alone making their own trouble with their tongues."

There the subject dropped, as man and wife have other things to talk about beside their neighbors.

The old women at the toll-bar, what with their own fears and their Job's comforter, began to shiver with apprehension as night came on. However, at sunset the carrier passed through the gate, and at the sight of his friendly face they brightened up. They told him their care and begged him to sleep in the house that night.

"Why, how can I?" said he. "I'm due at ——. But I will leave you my dog. The dog was a powerful mastiff.

The women looked at each other expressively. "He won't hurt us, will he?" sighed one of them, faintly.

"Not he," said the carrier, cheerfully. Then he called the dog into the house and told them to lock the door, and went away whistling.

The women were left contemplating the dog with that tender interest apprehension is sure to excite. At first he seemed staggered at this offhand proceeding of his master—it confused him; then he snuffed at the door; then, as the wheels retreated, he began to see plainly he was an abandoned dog; he delivered a fearful howl and flew at the door, scratching and barking furiously.

The old women fled the apartment and were next seen at an upper window screaming to the carrier:—"Come back! come back, John; He is tearing the house down!"

"Drat the varmint!" said John, and came back. On the road he thought what was best to be done. The good-natured fellow took his great coat out of the cart and laid it down on the floor. The mastiff instantly laid himself on it. "Now," said John, sternly, "let us have no more nonsense; you take charge of that till I come back, and don't ye let nobody steal that there coat nor yet t' wives' brass. There, now," said he kindly to the women, "I shall be back this way breakfast-time, and he won't budge till then."

"And he won't hurt us, John?"

"Lord, no. Bless your heart, he is as sensible as any Christian; only, Lord sake, women, don't you go to take the coat from him or you'll be wanting a new gown yourself, and maybe a petticoat and all."

He retired, and the old women kept at a respectful distance from their protector. He never molested them; and, indeed, when they spoke cajolingly to him he even wagged his tail in a dubious way; but still, as they moved about, he squinted at them out of his bloodshot eyes in a way that checked all desire on their part to try on the carrier's coat.

Thus protected, they went to bed earlier than usual. They did not undress; they were too much afraid of everything, especially their protector. The night wore on, and presently their sharpened senses let them know that the dog was getting restless; he sniffed and then he growled and then he got up and pattered about, muttering to himself. Straightway with furniture they barricaded the door through which their protector must pass to devour them.

But, by-and-by, listening acutely, they heard a scraping and a grating outside the window of the room where the dog was, and he continued growling low. This was enough; they slipped out at the back door and left the money to save their lives; they got into the village. It was pitch dark and all the houses black but two; one was the public house, casting a triangular gleam across the road a long way off, and the other was the blacksmith's house. Here was a piece of fortune for the terrified women. They burst into their friend's house. "Oh! Jane, the thieves have come!" and they told her in a few words all that had happened.

"La!" said she, "how tiresome you are! Ten to one he was only growling at some one that passed by."

"Nay, Jane, we heard the scraping outside the window. Oh, woman, call your man and let him go with us."

"My man—he is not here."

"Where is he, then?"

"I suppose he is where other working women's husbands are—at the public house," she said, rather bitterly, for she had her experience.

The old women wanted to go to the public house for him; but the blacksmith's wife was a courageous woman and, besides, she thought it was most likely a false alarm. "Nay, nay," said she, "last time I went for him there I got a fine affront. I'll come with you," said she. "I'll take the poker and we have got our tongues to raise the town with, I suppose."

So they marched to the toll-bar. When they got near it they saw something that staggered this heroine. There was actually a man half in and half out of the window. This brought the blacksmith's wife to a stand-still and the timid pair implored her to go back to the village. "Nay," said she; "what for? I see but one—and—hark! It is my belief that the dog is holding of him."

However, she thought it safest to be on the same side with the dog, lest the man might turn on her. She made her way into the kitchen, followed by the other two, and there a sight met her eyes that changed all her feelings, both toward the robber and toward each other. The great mastiff had pinned a man by the throat and was pulling at him to draw him through the window, with fierce but muffled snarls. The man's weight alone prevented it. The window was like a picture frame, and in that frame there glared, with lolling tongue and starting eyes, the white face of the blacksmith, their courageous friends' villainous husband. She uttered an appalling scream and flew upon the dog and choked him with her two hands. He held and growled and tore until he was all but throttled himself; then he let go and the man fell. But what struck the ground outside, like a lump of lead was, in truth, a lump of clay; the man was quite dead and fearfully torn about the throat. So did a comedy end in an appalling and most piteous tragedy; not that the scoundrel himself deserved pity, but his poor, brave, honest wife, to whom he had not dared confide the villainy he meditated.

The outlines of this true story were in several journals. I have put the disjointed particulars together as well as I could. I have tried hard to learn the name of the village and what became of this poor widow, but have failed hitherto. Should these lines meet the eye of any one who can tell me, I hope he will and without delay.

PHYSICAL INFLUENCES UPON CHARACTER.

THE influence of physical comforts upon us is far more considerable than we think, or would like it to be thought, perhaps. Let the most prayerful mind be ever so bent upon service to its Maker, its litany, its confessions of wrong-doing, and yet, in the very midst of its devoutest desires for amendment, the chilling frost of an uncongenial place or posture will nip the stoutest protestations in the bud. Temporal inconvenience, in nine cases out of ten, assuredly takes the upper

hand where spiritual prostration essays to acknowledge itself. However devotional the character of our mind, however we may make the best intentions to observe a lively faith in God's Holy Word," not to let it sink into mere hebdomadary letter-worship, clogged by the constant round of repetition, yet, should hard-backed seats beset us, should it unfortunately chance that a preacher's voice is droning or monotonous, these will, spite of an earnest endeavor to fix the attention, more or less affect our thoughts, and otherwise dispose of them. Even the flicker of an elusive sunbeam, or a dazzling fugitive mote, will have more influence in unsettling the mind of a would-be conscientious listener than any moral truth that is being poured out before him, and to which he would fain persuade himself to attend.

Among the lower classes, how very often it is to be remarked that physical comforts are more effectual in softening their character than the wisest words of the most judiciously-selected tracts. What, say they, is the use of trying to cure our souls, to ask us if we are true Christians, when our children are starving and we ourselves in cold and nakedness? Mere creature comforts will do more for ourselves and for them than any bare words or a holding up of exemplary lives. Among the women, too, more particularly, a brave burial and a worthy funeral is apparently more a matter of concern than even the loss they have sustained. All the comforting assurances with which kind neighbors ply them fail to create half as much personal satisfaction as the fact of their dead having a "decent" interment.

Of all the physical conditions most conducive to a rough but ready estimate of the character of any new acquaintance, or to give you an appreciable understanding of the neighbor besides whom you chance to take a seat, and which is as quick a process of discovering the "inner man" as any I know, is most certainly a dinner. A good dinner is a very safe criterion by which to form an opinion of another; and, let me add, a bad one will do equally as well. Whatever there is of good in a man—wit or humor, consideration or want of consideration, his pet foibles or his peculiar ambitions, will all manifest themselves and creep out bit by bit here and there, and proclaim the man despite himself, though, to be sure, you may be excluded from a certain share of unequable temper and such minor failings as are more specially reserved for home use, or rather home buse.

LENGTH OF MODERN CAMPAIGNS.

The great social feature of the present day is "pace;" everything goes ahead and armies must conform to this rapid order of things. Accordingly, military operations and results which used to occupy years are now compressed into months, it might almost be said weeks. The war of 1859 was declared by Austria on April 26; the first action, Montebello, was fought on May 19, and the war finished at Solferino on July 24. In 1866 the Prussians virtually declared war by crossing the Austrian frontier on June 23, and in seven weeks the latter power was forced to come to terms at the very gates of her capital. Prussia received the French declaration of war on July 19, 1870. On Sept. 2 France's last army in the field was destroyed at Sedan, and the last shots were fired on Feb. 2, 1871.

Here, then, we have at once an immense saving of life. The long delays, which meant for the soldier exposure to the weather and to sickness; the defective communications, entailing insufficient food; the slowly dragging campaign, with all its privations and hardships—all these fertile sources of disease and death have vanished, or are vanishing. It is true that the French soldiers both in and out of Metz suffered terribly from want of proper food and supplies; but it must be remembered that their administration was exceptionally bad and the very magnitude of their defects will prevent a repetition of them. Let us, for comparison, take one or two instances from the wars of the first Napoleon. Here is the state of his army during the invasion of Russia in 1812, not after but before meeting the enemy otherwise than in small skirmishes:

"From the want of magazines and the impossibility of conveying an adequate supply of provisions for so immense a host, disorders of every kind had accumulated in a frightful manner on the flanks and rear of the army. Neither bread nor spirits could be had; the flesh of over-driven animals and bad water constituted the sole subsistence of the soldiers, * * * and before a great part of the army had ever seen the enemy, it had undergone a loss greater than might have been expected from the most bloody campaign. When the stragglers and sick were added to the killed and wounded, the total reached 100,000."

Again, Massena entered Portugal in October, 1810; spent weeks and weeks in futile examination of the lines of Torres Vedras; and re-crossed into Spain on April 3, 1811, "having lost 30,000 men by want, sickness and the sword." As the only action of any importance that occurred during the retreat was that of Barrosa, at which the French loss was under 1,000, the reader can estimate for himself what proportion of the total loss was due to "want and sickness." These are but two instances out of many that might be quoted, but enough. Such protracted neglect and suffering would be impossible in these days, for the simple reason—if for no other—that the soldier is now much too expensive an article to be squandered in such a wholesale manner.

PERILS OF STAGE BALCONIES AND BOATS.

Do you see that lovely little balcony jutting out from that second story window of the scenery? Of course you do, for as you look the prima donna steps gracefully forth and warbles a song to the stars. You envy her picturesque surroundings and imagine that she stepped through the casement out of a dainty boudoir. Not a bit of it. With trembling limbs she scales a shaky ladder, treading on her dress at every step and mentally blessing the carpenter. Her maid holds her train and the stage manager and one of the chorus guide her uncertain footsteps. Everything is dark and gloomy before her eyes. In a moment she steps out upon the balcony and faces the applauding audience with an angelic smile upon her countenance, while she wonders if the props are perfectly secure and whether the whole thing will come down and cripple her for life. Then she sings her song and steps out upon the little platform and backs down into the arms of her mother, who wraps a shawl around her shoulders, while the maid again takes up the train and the three run into the dressing-room to get out of the way of the draughts.

Another thing the audience dote on is a chorus song without accompaniment—sort of impromptu, you know. But they should see the preparations made for the impromptu. The boat is about leaving the wharf and the sailors stand round to sing a parting song. The leader, who is generally an excitable German, gets them together, and the audience wait in pleasant expectation. He counts one, two, three, and gives the pitch. "Mein Gott! a tone below!" and he rushes away with his fingers in his ears, while the men sing on as lustily as though they were on the right track, and the audience says, "How sweet!"

In "The Star of the North," when Catterina goes to the wars, she gets on board a boat and sails away. It looks beautiful from the front, where everything seems so real. All there is like a boat is a painted side. She steps upon a platform on rollers and is pulled along by a couple of stalwart scene-shifters standing in the wing. Sometimes the rollers want greasing and stick so that no pulling will budge them; then the singer, if she has presence of mind, steps upon the stage and wriggles out with as little of the motion of walking as possible. One night, when Miss Kellogg was playing "Somnambula," as she was crossing the bridge the planks broke, not in the usual way, but really, and left the gentleman who was leading her along on the other side standing in bold relief before the audience—dress coat, crush hat and all. Fortunately no harm came of the accident.

One night, Mr. Lawrence Barrett and Miss Marie Gordon were playing a part on top of a tower some twenty feet above the stage, and while they were up there, something cracked and the whole thing swayed to and fro like a ship at sea. The props had not been made firm and, had the actors not luckily got down in time, they would have been killed, or worse. I shall not repeat what Mr. Barrett said to the stage carpenter.

TEACHING A SMART DRUMMER THE GOOD OLD ENGLISH LANGUAGE.

As a newly engaged commercial traveler was about starting on a commercial trip from his place in Chicago, the other day, he suddenly turned to his employer, a grave old merchant, and inquired:

"I say, boss, what shall I do when I get out of soap?"

"Soap?" said the old man, "why, save your samples and you won't get out."

"But I mean what shall I do when I get out of grease?" continued the young man.

"Grease—grease?" pondered the old man, "why, you don't need any grease; you are not working for a lubricating estab——"

"Oh, but you don't understand me," chimed in the youthful employee, rather embarrassed. "I mean, what shall I do if I run out of spondulix—stamps—wealth?"

"Spondulix—stamps—wealth?" echoed the mystified merchant, looking at the young fellow over his glasses, to see if he had gone crazy.

"Yes, currency—greenbacks," exclaimed the drummer, "cash money, you know?"

A light seemed to dawn on the old gentleman's mind at this moment, for gazing upon the creature before him with a look of contempt and pity, he broke forth:

"Young man, what are you giving us? I rather guess you needn't go out, for I don't believe your class of customers could get along very well with you—they all speak English. Pull down your vest, step up to the cashier's desk and get your sugar. Now cheese it, cully, you're bounced."

And that is the way the high-toned kid got bounced—all through the pernicious habit of slinging slang.—*Cincinnati Enquirer.*

RECIPE FOR A "PATHETIC" POEM.

The following recipe for a "pathetic marine poem" appears in a new English book:—"Take one midnight storm and one fisherman's family, which, if the poem is to be a real success, should be as large and as hungry as possible, and must contain at least one innocent infant. Place this last in a cradle, with the mother singing over it, being careful that the babe be dreaming of angels, or else smiling sweetly. Stir the father well up until he disappears. Then get ready immediately a quantity of cruel, crawling foam, in which serve up the father, directly on his reappearance, which is sure to take place in a hour or two, in the dull, red morning. This done, a charming saline effervescence will take place among the remainder of the family. Pile up the agony to suit the palate, and the poem will be ready for perusal."

THE SALARIES OF GOVERNORS.

New York pays to its Governor an annual salary of $10,000, which is the highest paid in the Union. Louisiana pays $8,000, California $7,000, Nevada $6,000. Eight States—Kentucky, Massachusetts, Missouri, North Carolina, Pennsylvania, Texas, Virginia and Wisconsin—pay $5,000; Maryland $4,500. Three States—Alabama, Georgia and Ohio—$4,000. Arkansas, South Carolina and Florida pay each $3,500. Kansas, Indiana, Minnesota, Mississippi, New Jersey and Tennessee pay each $3,000. Illinois, Iowa and Maine pay each $2,500. West Virginia $2,700. Connecticut $2,000, Oregon $1,500, Delaware $1,300, and Michigan, Nebraska, New Hampshire, Rhode Island and Vermont pay their Governors respectively a salary of just $1,000.

The Literary World.

RECENT LITERATURE.

Haydon's Life, Letters and Table Talk. Edited by R. H. Stoddard. Sans-Souci Series. [12mo.—cloth; pp. 311. Price, $1.50.] New York: Scribner, Armstrong & Co.

The success of the "Bric-a-Brac" Series has, it seems, justified the publishers in issuing these volumes, which differ from their prototypes only in degree. Mr. Stoddard has displayed his usual good judgment in selection, but the reader who takes up the life of Haydon in a careful spirit and diligently follows its suggestions, will shortly be plunged into a sea of art matters and gain an idea of the most interesting period of British art which, while giving pleasure, will certainly not be gained sans-souci.

Haydon was an iconoclast and broke idols with true English fervor and completeness. To him more than to any one is the British nation indebted for the Elgin marbles. He perceived their excellence and maintained his views against the combined Royal Academy, with Mr. Payne Knight thrown in as a sort of compensating balance. His career was one long struggle, mainly because of his own fractiousness, and while personally he was severely treated, his influence on the Academy and art generally in Britain was most salutary.

As an instance of his tremendous energy, it may be mentioned that Haydon had chosen subjects and contemplated composing and painting 38 pictures. In view of the fact that he was painstaking to a most minute degree and that he lived to finish but nine or ten, may give an idea of the possibilities he contemplated. His first picture, "Dentalus," was painted in and out several times, and Fuseli found fault with it on the ground that it "looked too much like life." Soon after he saw the Elgin marbles. "The first thing I fixed my eyes on," he writes, "was the wrist of a figure in one of the female groups, in which was visible the radius and the ulna. I was astonished, for I had never seen them hinted at in any female wrist at the antique. I darted my eye to the elbow and saw the outer condyle visibly affecting the shape, as in nature. I saw that the arm was in repose and the soft parts in relaxation, as in nature. My heart beat! If I had seen nothing else I had seen enough to keep me to nature for the rest of my life." This decided him and was the turning point in his career.

The volume under notice is divided into three parts—Life, Letters and Table Talk. The letters are sprightly and give evidence that he was quite as skillful and much more sensational with the pen than the brush. Some of his observations are piquant to a degree, as "Fuseli said to me once that people generally went to church in proportion to their profligacy. I had it on the tip of my tongue to tell him that I wondered he did not go every day."

"One of the greatest annoyances in life is the remarks of common minds when criticising great works. Such people always miss in great works the very things their minds would not have left out. They never think it possible for a man of genius to have left them out *by choice*. Oh, no! They imagine such things never occurred to his conception, and thus they chuckle over illusive imperfections with a self-congratulatory air of conscious superiority."

One bit of advice would have saved him a deal of trouble had he had the wit to take his own medicine. It says:—"Never disregard what your enemies say. They may be severe; they may be prejudiced; they may be determined to see only in one direction; but still in that direction they see clearly. They do not speak all the truth, but they generally speak the truth from one point of view; so far as that goes, attend to them."

The anecdotes related of various celebrities are in many instances capital. Brief, the book is exceedingly readable and typographically sustains the reputation of the house that issues it.

THE OLD PASTOR'S DISMISSAL.

"We need a younger man to stir the people
And lead them to the fold,"
The deacons said: "We ask your resignation,
Because you're grown so old."

The pastor bid the deacons out in silence,
And tenderly the gloom
Of twilight hid him and his bitter anguish
Within the lonely room.

Above the violet hills the sunlight's glory
Hung like a crown of gold,
And from the great church spire the bell's sweet anthem
Adown the stillness rolled.

Assembled were the people for God's worship:
But in his study-chair
The pastor sat unheeding, while the south wind
Caressed his snow-white hair.

A smile lay on his lips. His was the secret
Of sorrow's glad surcease;
Upon his forehead shone the benediction
Of everlasting peace.

"The ways of Providence are most mysterious,"
The deacons gravely said,
As with wondering eyes the people crowded
About their pastor—dead!

"We loved him!" wrote the people on the coffin,
In words of shining gold:
And 'bove the broken heart they set a statue
Of marble white and cold.

The end? Ah, no—the undiscovered country
Somewhere in the brightness lies;
Though only stars may be discerned
By man's shortsighted eyes.

[*Elizabeth Cummings.*

REMINDERS.

BY MRS. HATTIE F. BELL.

"Rev. —— received twenty-five hundred dollars from his congregation the other day, to remind him he was fifty years old." Did he? That was a very happy reminder, I should judge. I wonder who, among us all, would refuse to receive such reminders, as year after year bears away our freshness and youth and gives old Father Time renewed license to scamper helter-skelter over our faces, leaving his ungraceful footprints at every corner and scrawling his crooked autograph in indelible distinctness in horizontal furrows upon every brow. Twenty-five hundred dollars! I'm sure that's more than a dollar for every wrinkle that fortunate fifty-year-old divine possesses or could ever count on his benign face with the aid of a microscope. We all have such a direful dread of growing old, we are not very apt to relish anything that suggests the fact to us, however remotely, and we try to conceal, as much as possible, the slightest appearance that would hint to any one the bare possibility that old age is creeping on and we are leaving our youth behind us. But oh! who could frown upon such a timely reminder as this! Would you? I'm positive I wouldn't if I should ever be so old. I wouldn't object to one even now; but I'm not a minister nor even a minister's wife, (though I am sister-in-law to a couple of the profession,) so I do not expect my down-hill journey to be smoothed by any such startling event; but what a blessed thing it would be if every pastor had so appreciative a people! Why don't every church remind its pastor he is fifty years old in this pleasant way? Or at thirty, or forty, I presume the reminder would not come amiss. Not that every church could give twenty-five hundred dollars, but even a small amount would gladden the heart and cheer the soul of some faithful pastor and give him new courage and inspiration for a year to come. Alas! how many prefer rather to remind their minister he is growing old by keeping him upon so meager a salary that want stares him in the face and reflects its own image thereon, and the poor man has only to look into the mirror when he combs his thin locks, to behold a very forcible reminder that he is growing old. They perhaps give him a bread-and-butter donation, where they carry their own supper and eat it all up before they go away, leaving a half bushel of chicken bones and a few unleavened biscuit, and they nod their wise heads and say, "I don't see but that he ought to get along, now." Get along? Yes, he does get along. He gets a long account drawn up with the doctor, for sour biscuit can't be traded off for flannel and chicken pie won't buy children's shoes. And then, after toiling and wearing himself out uncomplainingly for such an unthankful, unappreciative people, he some day receives another gentle reminder that he is growing old. They "Want a smarter, younger man, some one who will keep up with the times." As if any man could keep up with the times or keep up at all, under such a pinching and grinding process and such a desperate struggle for life! But I'm glad there is at least one church in the land who appreciates its pastor and who will not groan for the next half century because of this extra "lift" in thus happily reminding him of his fiftieth birthday.

Heaven bless that people—I was going to say, Heaven bless that pastor. But he is blessed in having such a people, so I will only add, Heaven bless us all and give us grace to appreciate our blessings before they brighten in a fast, long flight.

Religion finds the love of happiness and the principles of duty separated in us; and its mission—its masterpiece—is to reunite them.—*Vinet.*

Ladies' Portfolio.

RAMBLES IN AN OLD GRAVEYARD.

DEAR RURAL:—

"Of comfort no man speak;
Let's talk of graves, of worms, and epitaphs."

And particularly of epitaphs. And firstly I want to enter a protest, in the name of respect and propriety, against the people hereabouts for the want of proper care and attention to the grave-yards. Here is one,—the most neglected,—that in this Centenary year at least should, by its age, be entitled to sufficient attention to cause the elder trees, whortleberry bushes and blackberry vines to be kept out and the weeds and grass cut sufficiently often to render access to the graves practicable, in which only a few lots are kept with care, attesting the fact that those buried therein have left behind some relative or friend to whom their memory is dear. And these exceptions only serve to make the neglect of the remainder more apparent. This, too, in a community including many who seem to believe it possible for the spirits of the departed to visit and communicate with them relative to mundane affairs. Is is not preposterous to suppose they would hesitate to make a row about this insult to their memories, if they had the power and opportunity.

In another yard or cemetery, as I find they are all called now, which is of more recent dedication and more pretentious, the same general neglect obtains, but not to the same extent, while the fact that it is owned by a corporate company, of which each lot-owner is a member, and that there is money lying idle in the treasury, only awaiting proper direction for expenditure, to put and keep the whole grounds in good condition, seems to fix the blame more directly, and to hold up the officers of the company as the persons toward whom the finger of scorn should be pointed. I might have omitted all this but from the fact that I know other rural communities sin in the same direction, and indulge a hope that their attention may be called to the error of their ways.

Individually, I don't believe in grave-yards, funerals, mourning costumes, or any of the fashionable services or ceremonies attendant on that change which we call Death. But this is not a place for an essay on the subject.

At the risk of scratched hands and torn clothes, I recently forced my way through the obstructions to some of the old head-stones with which I was familiar long ago. Some of them have fallen on the ground, and are nearly covered with the accumulated remains of the grass and weeds that grew above them years ago; some are broken in half, and others, still standing, are so far from perpendicular as to give no promise of retaining their position through the frosts of another winter.

Near one corner of the yard is a plain, red free-stone, about two feet square and two inches in thickness, which bears the following legend:

Here lies ye
Body of LUCE the
Daughtr of Sergt
Isaac Skinner who
Died Febry ye 22rd
1739-40 aged 18 year
this was the first Perso
that was Buried Here

The custom of putting both the old and new year for a date until March was continued in New England until long after the time above named.

Many of the stones bear, beside the name and age of the person for whom they were erected, a few lines of counsel, admonition or advice; some of whom, from their frequency, seem to have been quite popular—as these:

"Behold and see as you pass by,
As you are now so once was I,
As I am now so must you be,
Prepare for death and follow me."

It is said some wicked fellow once wrote under this inscription:

"To follow you I am not content,
Until I know which way you went."

"Afflictions sore long time I bore,
Physicians were in vain—
Till God did please to give me ease
And take away my pain."

"Friends and physicians could not save
My mortal body from the grave,
Nor can this clay confine it here
When Christ shall call me to appear."

The following, although inscribed with no regard to orthography or measure, was evidently selected by one of higher poetic feeling:

"Life's a journey! Man the rugged path with hope and fear alternate travels on; but ere his journey half is o'er grim death like villain in the dark lets fly his quivering dart; the traveller falls."

"Death is a debt to nature due,
Which I have paid and so must you."

and many others common elsewhere.

Others bear the evidence of originality in their composition or arrangement—as these:

"No. I'll repine at death no more,
But with a *cheerful gasp* resign
To the cold dungeon of the ground
These dying, withering limbs of mine."

"My flesh shall slumber in the ground
Till the last trumpet's joyful sound,
Then burst *the chains of sweet surprise*
And in my Saviour's image rise."

"Ah fled forever from my view,
Thou partner of my soul adieu."

"Farewell my friends who are alive,
Who visit my abode;
I wish you all to live in love
And make your peace with God."

"When I was young I did die;
Why not you as well as I?"

"In youthful bloom death laid me down,
Here to await the trumpet sound;
Repent, repent now you have time,
For I was taken in my prime."

"Cease, friends, to mourn your tender parents' fate,
But think of death before it is too late."

"In blooming youth death called on me
To leave my friends and family;
At his command I then must go,
And bid adieu to all below."

The epitaph of HEZEKIAH GOODWIN, A. M., and Minister of the Gospel, aged 27 years, was, as certified on his head-stone, composed by himself on his death-bed, as follows:

"How short, how precarious, how uncertain is life! How quick the transition from time to eternity. A Breath, a Gaspe, a groan & lo, we're seen no more. And yet on this point, oh alarming thought, on this slender point swings a vast Eternity."

We do not see precisely where the point is to which reference is made—whether it is Life, a Breath, a Gaspe or a groan—but perhaps it is as clear as could be expected. Possibly death-beds are not the best places on which to compose epitaphs.

It is fairly inferable that the Widow SAMANTHA COOK had a talent for epitaphs. Mr. PINNEY COOK was presumably her husband, as his grave is beside hers, and a stone adjacent marks the resting place of a son of PINNEY and SAMANTHA COOK, but on three others, which I have always been told were inscribed by her direction, the record is, "Daughter of Widow SAMANTHA COOK," and gives no clew to the personality of the male progenitor. Nor does that for herself inform us of whom she was widow.

On one of these stones—that of Mrs. ALMA MEACHAM—is a condensed biography, thus:

"Sixteen years I lived a maid,
Two years I was a wife,
Five hours I was a mother,
And so I lost my life.
My babe lies by me, as you see,
To show no age from Death is free."

The next stone says of MIRA COOK:

"One day in health I did appear,
The next a corpse fit for the bier."

SAMANTHA'S is equally brief:

"Friends and brothers see where I lie.
Remember you are born to die."

This for the husband is more elaborate, as is eminently proper:

"What sudden terror death doth bring!
It takes the Peasant and the King:
Then prepare beath one and all
For to be ready when God doth call."

The stone for a young lady of 24 years bears this couplet:

"Sleep safe, *sweet babe*, till Jesus comes
And raises all from sleeping tombs."

It is seldom that more information relative to different persons is condensed in the same space than in this:

"In memory of Mrs. ELESABETH NEWBERRY, Relict of Capt. Roger Newberry, who died in the Cuban Expedition, A. D. 1741, in the 35 year of his age. Eldest daughter of the Hon. Roger Wolcott, Esq'r, sometime Governor of the Colony of Connecticut. She died the 6 day of July, A. D. 1775, in the 70 year of her age."

I wish it were possible to transfer to your columns specimens of the handiwork of the artist whose designs ornament some of these head-stones. I doubt if anything equal in absurdity has ever been cut. The hieroglyphics of Egypt, although sometimes uncouth, have a meaning, but if any sense pertaineth to these, it is past the finding out of the present generation. Their uncouthness haunts me while I write, and I am inclined to think it was the remembrance of them, more than the fear of ghosts, that used to impel us boys to keep our courage up by whistling when passing at night.

If there was more originality in monumental inscriptions, they might give valuable assistance to the historian who shall endeavor to set forth the Progress of Religious Ideas in New England. It is somewhat noticable that even in the days when almost the entire community professed to believe in the everlasting torment of all save the elect,—"the chosen seed of Israel's race,"—condition after death was seldom referred to on tomb-stones.

Perhaps it is true, what a good orthodox lady once remarked to a Baptist friend of mine, while at a burial, "We are all Universalists at funerals."

L. A. R.

Bloomfield, Conn.

WHAT IS A BACHELOR?

ADAM with a choice of Eves.

A mule that shirks his regular load.

A wild goose in the air, hissed at by tame geese in the farm-yard.

A wise child, who declines to buy sugar candy by the hundred weight.

WHAT IS LANGUAGE?

GOLD leaf to blazon knowledge or cover ignorance.

A servant who too often is master.

A large issue of notes, sometimes on a small basis of capital.

A chain which unites men, yet keeps them disunited.

Reading for the Young.

MOTH-ER MOUS-EY'S LECT-URE.

My dear lit-tle mice,
You're old e-nough now
To get your own liv-ing
If I tell you how.

The times are so hard,
That I need all the bits
I find for my-self—
You must live by your wits.

Do you see that square door?
And the nice toast-ed cheese
On the end of that wire?
Keep a-way from it, please.

Last even-ing your aunt,
And your young cous-ins four,
Saw that cheese and went in
Through the wide o-pen door.

I watched a long time,
But they nev-er came out;
For this is the trap
That you've all heard about.

Now prick up your ears
And hear what I say:
Never taste of a thing
That is left in your way.

But when, snug-ly hid,
You find a rich cake,
Or a nice, cream-y cheese,
Then a good din-ner make.

So will your days pass,
With-out a mis-hap,
And you'll live to old age
In spite of the trap.

LETTERS FROM BOYS AND GIRLS.

A Pretty Parlor Amusement.

RURAL COUSINS:—A clever little trick occurs to me which a year or so ago I enjoyed greatly perpetrating upon some of my young friends, and I doubt not you will enjoy it too unless they chance to know it already. Try first your papa. Ask him for five cents; then produce five cents yourself. If not the possessor of so large an amount, one cent each will answer.

"Now, papa," you say, "If you answer to the first question I ask 'No,' both pennies are mine. If you answer 'Yes,' both pennies are yours. Will you agree to that? I assure you there is no catch."

Your papa will of course agree to so fair a proposition—anybody would.

"You agree, do you, papa?"

Papa answers that he does.

"Now," you say, as if the thought suddenly occurred to you,—"*But have you not seen this trick before, papa?*"

In nineteen instances out of twenty the answer will be No!

Both pennies or five cents are yours.

What do you think of this trick, RURAL Cousins?—JOE STEELE.

Thanks for the Extra Column.

DEAR EDITOR:—As I was reading your paper to-night I saw the notice saying we (the young folks) could have one more column in the RURAL. And as I was so pleased with it, I could not help sitting down to write a letter of thanks for it. I have written two letters to you before, but as I saw only the first in print I suppose that Uncle TRUE did not receive the other. As there are a good many new Cousins, I suppose I will have to tell my age and residence over again. I am twelve years old, and I live not far from the village of Amsterdam, in the Mohawk Valley. I have one sister and two brothers younger than myself. I attended a Centennial Picnic about two weeks ago, near the Schoharie Creek. It was on the farm of my great-grandfather, and there was only one aunt living there (out of a large family), and she was ninety-three years old. O dear! I came near forgetting it, i. e., to thank you for your kindness to us little folks.—ROMPING MINNIE, *Amsterdam, N. Y.*

A Firebrand Among Us.

YOUNG LADIES AND GENTLEMEN:—I will not say Cousins, for I fear that when you have read this you will not be willing to admit me as a Cousin—some of you at least. But I have been wanting to speak for so long that now I must have my say. First, I would say that I think CRITIC is a perfect gentleman, and he ought to win the admiration of all the ladies. Second, I don't at all agree with YOUNG ARTIST about piecing quilts. One don't regret the time one spends in cutting cloth in pieces to make ruffles, knife plaiting, etc., and I think piecing quilts is the best invention ever made. Of course people have a right to their own opinion, of which I am very glad. Third, YOUNG EDITOR, I think you are very accommodating indeed. How much did Y. A. give you for taking up on her side? You can hold your own with her easily, you agree so nicely. SCHOOL GIRL is very sensible, and she has my regards. Perhaps you would like to have me describe myself, to see what sort of a girl I am. Well, I can do it, so here goes: I am about five feet tall; have dark hair, eyes and complexion; am in my teens, and will be for several years to come. Let me hear your opinions—you cannot frighten me by any of your words. Excuse this lengthy scolding. Now is your time, Y. A. and Y. E.—BELLE E. F., *Maplewood Glen, Ills.*

[WILL my spirited young friends brook this taunt? No, never! If YOUNG EDITOR is made of the true stuff he will respond with a "leader" that will define his position in vigorous Anglo-Saxon.—UNCLE TRUE.]

A Typo in the Field.

How do you do, Cousins? I know some of you are ready to ejaculate, "Well!—where did you come from?" I can easily answer your inquiry. I live in Illinois, south of Chicago, on a farm of about 400 acres. I am a printer by trade, but am rusticating at present. I think it is a jolly life for those who choose to make it so. Uncle has taken the RURAL for over 18 years. He takes 12 papers, of which I think the RURAL is the best, as it has an interesting column for everybody. I watch the Young Folks' column with interest. Our Young Editorial Cousin gives us quite a spicy little article, but I don't exactly agree with him. He "can't see the use of cutting up calico just for the pleasure of sewing it up again," but let me ask, why do you distribute your "form" of type after you have had the trouble of setting it up? Why simply for this—you want to show your patrons something new from old material. Don't try to discourage the girls from learning to sew, for it may some day prove beneficial to somebody if not Y. E. He goes on to say the girls "need not think they can preach decorum. If they try we will make a noise and not listen to them." Now I say that if our manners are not what they should be, who is more qualified to give a reproof than the fair sex?

I, like Young Artist, am "in my teens." I should like to correspond with Y. A. if agreeable, as I have also a natural taste for drawing and think I could give her some valuable information on that subject.—YOUNG PRINTER.

From a Floriculturist.

DEAR RURAL COUSINS:—I always read the letters from boys and girls, and noted the one about writing and telling of our flowers. I love flowers *ever so much*, and I like to read about them. I have a real nice Botany which I study every spring. I have an Oleander which is in bloom, and I think the flowers are handsome. Such a delicate perfume and beautiful color! Then I have some Morning Glories; they have blue and pink, white and pink, and white flowers on them. One or two vines have dark purple flowers with bright crimson edges. These are the prettiest, I think. Mother has a Portulaca which has crimson flowers on one side and pink and crimson striped on the other. Isn't that strange? Of running house plants we have only two, a Wandering Jew and a Madeira vine. The former grew finely, and had beautiful, glossy green leaves. I thought ever so much of it. But all at once the leaves grew whitish, and one day mother found some ants and little black bugs in the soil it was in. She cut it almost all off, changed the soil and put it out of doors. It is now growing nicely. The Madeira vine we trained over the window, and it grew nicely. But one day there came a great wind (they are common here in Jersey) and broke it off down almost to the roots. I felt almost sad enough to cry over it. I had lots of flower seeds, but had no place to plant them. The hens scratched up almost all my Flowering Beans, and ate up nearly all my Morning Glories at first; they recovered though, and grew real fast. They are as high now as the string goes. The hens tipped over my pan of Portulacas and broke them all up. I am twelve years old, weigh 122 pounds and am five feet, six and a-half inches high.—CORA A. L., *North Vineland, N. J.*

One More Recruit.

DEAR UNCLES:—I was just reading over the letters from the girls and boys. It made me think I could write too. I have made several attempts, but did not succeed. I live on a farm in St. Lawrence Co., about four miles from the St. Lawrence River. I am thirteen years old, and milk from six to eight cows twice a day. I go to school, summer and winter. We keep seventy-three cows, one Short-Horn calf, six horses, one colt, fourteen hogs, fourteen pigs, one dog, three cats, and I don't know how many kittens. We do the most of our work by machinery; use a hay loader, horse fork, mowing machine; churn with a sweep power, and use a churn that holds more than 100 gallons. We are having a dreadful drought in this section, and grasshoppers are very thick and destructive. Some of our neighbors are cutting their grain green on account of them, and are not going to thresh at all. I think this will do for my first attempt.—A. J. D., *Massena, N. Y.*

[I THINK A. J. D. should feel encouraged to continue. For a first attempt his letter is a success, combining as it does news and clear statements. —UNCLE TRUE.]

Early Snow.

DEAR UNCLES:—As you were so kind as to publish my first letter, I thought I would write again. I had begun to despair of ever seeing it in print, but on opening the RURAL of April 15, lo! it met my gaze. Whereupon I took heart and have ventured to throw myself for a second time upon your mercy. I wish "Young Naturalist" would write again, also Miss "Dew-Drop." "Dew-Drop," make your tongue wag to the best of your ability and if "Young Bach.," the saucy fellow, says anything about it (your tongue) I will come to your aid and help defeat him. Father says that perhaps "Young Bach." is only treasuring up all you have said to him girls, and that by-and-by he will bring matters to a grand climax and write a letter that will send us all down into the valley of humiliation. But I do not think he is capable of it, any way.—SNOW DROP, *Norfolk Co., Va.*

From Ulster Co., N. Y.

DEAR FRIENDS:—I have been reading with a great deal of interest your letters for the past few

months, and find them very interesting. As I had not seen any from Ulster Co I thought I would contribute my share. I think the Editor is very kind to let us have a nook all to ourselves, where we can converse with each other and have a general good time. I would like to tell you something of my studies, but have only time to say that History and Grammar are my favorites. In addition, I take lessons in swimming, rowing and driving. I am not skilled in the finer arts as are some of the cousins. I have a taste for drawing, but lack the patience. I can crochet very nicely. Perhaps you will think I am boasting when I tell you all I can do. But if I should tell you all I can *not* do, it would more than overbalance that which I can do. I like "Young Artist," and would like to see another letter from her. Of course I like you all, so you must not take offence. Brevity being the soul of wit, I will close.—MAY BELLE EVERSON, *N. Y.*

A Wild Crab.

DEAR EDITORS:—As you were so kind as to publish my other letter, I thought I would write again. How many of the Cousins have been to the Centennial? Many of the girls are smarter in school studies, but they cannot beat me working out-of-doors on the farm. I drove on the reaper again this summer. I have had enough to keep me busy all the time, as we are building a new house. We have been told by some that it is the largest house they have seen for a farm residence. I guess my letter is as long as the majority of them, so I will close, hoping to see my letter printed.—WILD CRAB.

Still They Come.

UNCLE TRUE:—I have been thinking for a long time of writing a letter to the RURAL, but have not attempted it until now. I hope you will print my first letter. My father is a farmer. I live six miles from Webster City. I go to school three months in summer and four in winter. I am 16. I am a reader of the RURAL and like it. Please accept me as a niece.—IDA M. C., *Webster City, Iowa.*

Brief, But to the Point.

MR. EDITOR:—I take your paper and am very much pleased with it. I get some very valuable information from it. I have been reading the letters from the girls and boys. I am 15 years old. I go to school and study various things.—A. BRYAN, *Monterey Co., Cal.*

The Puzzler.

ILLUSTRATED REBUS.

☞ Answer in two weeks.

DECAPITATIONS.

1. DECAPITATE a kind of grass, and leave an admirer.
2. Anything counterfeit, and leave a kind of meat.
3. A ship, and leave a noose.
4. A pattern, and leave sufficient.
5. A domestic animal, and leave a preposition.
6. An article of furniture, and leave competent.
7. A character in music, and leave a musical instrument.
8. A common implement, and leave a hut.
9. An article of furniture, and leave a filament.

☞ Answer in two weeks. O. S.

MISCELLANEOUS ENIGMA.

I AM composed of 21 letters:

My 9, 13, 6, 19 is a model.
My 1, 10, 16, 13, 20 an index.
My 4, 9, 17, 21 to dispute.
My 2, 14, 7, 16, 6, 12, 3 grass.
My 8, 11, 17, 7, 20 a trap.
My 5, 3, 18, 15, 20, 7 soft.

My whole is the pride of every American.

☞ Answer in two weeks. W. W. P.

DOUBLE ACROSTIC.

1. AN afternoon siesta. 2. A man of the Bible. 3. A lake of Ireland. 4. A river of England. 5. A city of Birmah. 6. A merry play. 7. A town on Long Island. 8. A country of India. 9. A loch of Ireland. Both primals and finals form fruits.

☞ Answer in two weeks. LITTLE ONE.

PUZZLER ANSWERS.—Aug. 26.

GEOGRAPHICAL ENIGMA.—Whoso keepeth his mouth and his tongue keepeth his soul from troubles.

NUMERICAL ENIGMA.—Knowledge is power.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

As we are now entering upon the second volume of the Twenty-seventh year of the RURAL NEW-YORKER, it would be well for the proprietors to say to subscribers and agents that a more prosperous time than the present has not been seen in this office for many a year.

Notwithstanding the cry of "hard times" which has been echoing through the land, the rural population seem to be able to take their paper. It may not be known to many of you that at the end of each year and half-year a newspaper changes a large number of its subscribers. Some old ones discontinue and their places are filled with new, so that while the list does not diminish in numbers, the changes frequently amount to many hundreds.

There were hundreds on our list whose subscriptions expired with the last number in June, and of these every one has *renewed* but *six*. This is something unprecedented in the annals of a newspaper office, and is the most flattering indication to the new management that their strenuous and laborious efforts to make a *good* paper are fully appreciated. With such encouragement as this, subscribers and agents may rest assured that nothing which time, labor and money can procure will hereafter be omitted to make the RURAL still better than it is.

The Literary Departments will be kept up to their standards of excellence and morality, while the Practical Departments will continue to be made up of the most straightforward common sense which can be obtained. In these matters the aim will not be to make them so scientific that they may not be readily understood by every one; but it will be our constant endeavor to publish that which is *absolutely correct*. Now, all that is needed is for each subscriber to get another and our list will at once be doubled.

News of the Week.

HOME NEWS PARAGRAPHS.

GEORGE ADAMS, the young man who so successfully played the role of the hero in the late averted railroad disaster at Fairport, has been arrested in Buffalo, N. Y., the evidence of his being the author of the outrages having been worked up by Special Detective Hugh Bottles of the New York Central Railroad. After his arrest he made a full confession. He alone, it seems, misplaced the switch which threw the train from the track of the Lake Shore and Michigan Southern Railroad on the 11th ult., whereby the engineer and fireman were badly scalded and the engine completely wrecked.

A serious accident occurred to the steamship Colon of the Pacific Mail Steamship Company. She broke a shaft in mid-ocean, the assistant engineer and an oiler were killed, and the vessel was towed back to this city.

A granite block weighing thirty tons was recently taken from the quarries near Hallowell, Me., and one weighing forty tons is soon to be brought out. It will require forty oxen to move it from its position.

A prize fight between two Philadelphia pugilists, Weedon and Walker, took place at Pennville on the New Jersey shore, on the 31st ult. It is said the Sheriff made an attempt to interfere, but was restrained by the mob. After 62 rounds Weedon was declared the victor. After the gang had left Penn's Grove they seized two small boats and put the principals on board of them. It is said that Weedon was landed at Chester, Pa. Early in the evening the dead body of Walker was found at the salt wharf at Greenwich Point. An investigation by the police disclosed the fact that a row-boat containing three men was seen about the wharf, and it is supposed that the men, in the boat placed the body ashore. Weeden was arrested in New York Sept. 1st and taken to Philadelphia.

The Tribune's La Crosse special gives details of a terrible explosion of the boiler of a steam thresher working at the farm of C. J. Jones, near Chatfield, Minn. The machine was in full operation when the explosion occurred. The engineer, Mr. Lawton, was blown 160 feet, his body breaking off a tree top twenty feet from the ground, and was instantly killed. Charles Arnold, the band cutter, was literally torn to pieces, and portions of his body scattered all around the separator. William Burnett, the measurer, had the top of his head taken off by a piece of the boiler. Everett Jones, the feeder, had a leg and an arm badly broken. The boiler was blown a distance of 200 feet.

Captain Turtle's detectives have successfully worked up the case of the bank robbery in Rensselaer, Ind., and have arrested three men—James Filkins, alias Martin, Martin Davis of Chicago, and N. V. B. Warner, a saloon keeper at Rensselaer.

FOREIGN NOTES.

THE impending change of rulers in Turkey was carried into effect on Aug. 31. In virtue of the decision of the Sheikh-ul-Islam, who is head of the Mohammedan Church and supreme interpreter of the law, Sultan Murad V. was deposed and his brother, Abdul Hamid, placed in power. The deposed Sultan was incapable of ruling because of mental infirmities. The new Sultan, it is thought, will be a vigorous ruler. He is in his thirty-fourth year and sound in health. The Turkish Minister at Washington has received the following dispatch, dated Constantinople, Aug. 31, from the Turkish Minister of Foreign Affairs: "The cruel disease of which the Sultan Murad Khan has been suffering ever since the tenth day of his accession to the throne, which aggravation has been constantly increasing, having put him in the manifest impossibility to take any more the reins of the Empire, in virtue of the Fetvah (decision) rendered by his Highness the Sheikh-ul-Islam, and conformably to the laws regulating the exercise of the sovereignty in the Empire, His Majesty the Sultan Hamid, presumptive heir to the imperial throne, has been to-day proclaimed Emperor of Turkey."

Abdul Hamid, the new Sultan, who has succeeded his infirm brother as ruler of the Ottoman Empire, is the second son and fourth child of Abdul Mejid, who was Sultan from 1839 to 1861. He was born Sept. 22, 1842. He is the 35th Sultan of the line of Osman, and will be known as Abdul Hamid II. His life has been quiet and uneventful. His mother died young, and he was adopted by his father's second wife, herself childless, who is very wealthy, and has made him heir to all her property. During the lifetime of his father, he, as well as his elder brother, the deposed Murad V., led a merry life, his every wish and fancy being indulged to the utmost, his education chiefly consisting in being diverted by the amusements and tricks devised for his entertainment by the numerous slaves surrounding him. His initiation into all the depravities of harem life was unusually early and complete; but his vigorous constitution withstood the effects of the excesses that undermined his brother's health, and when he married he was a strong, hardy lad. He accompanied his uncle, Abdul Aziz, and his brother Murad to the Paris Exhibition in 1867. He picked up a few French sentences on this journey, but this was not all the good it did him. He acquired a taste for political geography, and in his kiosk on the Sweet Waters, which he has hitherto inhabited regularly every summer, he has a very extensive and comprehensive collection of maps, military, geological, and statistical, the studying of which constitutes his favorite pastime. He also contracted a fondness for European manners and dress, the result of which is that he gets all his clothes from Paris, and has introduced French customs and demeanor into the daily existence of all those by whom he is intimately surrounded.

Abdul Hamid inherited from his father a small palace on the Sweet Waters. He has resided there with his wife and two children, a boy of six and a girl of three years, quite contentedly, eating at the same table, and playing with the little ones. He has a fondness for tame animals, as well as for stuffed ones, and has devoted much time and money to the collection of a choice assortment of handsome weapons. He is an orthodox Turk, and a resolute opponent of the "Young Turkish" party—being, in fact, an "Old Turk," but not, it is said, one of the fanatical sort. There is no question of his being a much abler man, mentally and physically, than his brother who has just been deposed. The only symptom of Orientalism in his own personal appearance is in the fez, which he dislikes, but still continues to wear, because it is the necessary token of his nationality. He is represented as taking a deep interest in the working classes and their condition, is said to be measurably free from the special vices of Turkish princes, is neither a drunkard nor a spendthrift, and lives a quiet, domestic life, with his one wife-in-chief, although, in accordance with the tenets of his religion, he owns a number of female slaves, or odalesques, as they are called.

A dispatch from Constantinople, Sept. 1, says the deposition of Murad occasions no excitement or disturbance. The deposed monarch has been assigned the Teheregan Palace as a residence. Abdul Hamid, the new Sultan, was yesterday received by the Ministers and functionaries at the Topcapen Palace, where he was proclaimed Abdul Hamid II.

The entire city was illuminated at night in honor of the new Sultan. The Turkish and foreign ships in the harbor were decorated with flags. The ceremony of girding Abdul Hamid with the sword of Osman is announced for the 9th inst.

Giuseppe Mantegazza, sixth Marquis of Liscate, charged with forgery, fraud and falsification in forging the names of King Victor Emanuel, Prince Humbert of Savoy and the British Consul at Florence to a number of bills of exchange, has been convicted and sentenced to eight years' penal servitude.

A Ragusa dispatch says that Dervish Pasha had reached Podgoritza with a strong detachment of Egyptians and Arabians. The Turkish force at Podgoritza is now formidable. It has 54 guns. The Prince of Montenegro's headquarters and army are between Danilloograd and Grahoca.

The Standard's special correspondent at Belgrade asserts that Gen. Leschjanin shot himself purposely; that the Servian reports of victories are inconsistent with each other and mostly imaginary, and that English correspondents have been obliged to take the war news, cut and dried, from the Servian Press Bureau.

Philip Phillips, the "Singing Pilgrim," now in London, has sung through India and Australia.

Official intelligence received announces that the Turks were defeated at all points on the right bank of the Morava and subsequently taken in flank and put to flight. Their bridges over the Morava were destroyed. The Servians occupied the Turkish intrenchments on the right bank of the Morava.

Beef and mutton cost about three cents a pound in Servia, a turkey fetches a shilling, a pair of fowls may be had for six cents, and a draught ox only costs from $10 to $12. Native tobacco and wine are similarly cheap, but bad.

A fire broke out in the western end of the City of St. Hyacinthe, Province of Quebec, at 1:30 P. M., Sept. 3, which, fanned by a high wind, swept the lower part of the city out of existence, the St. Hyacinthe, Quebec and National banks, Post-Office, Market, Court-House, factories and over 80 wholesale and retail stores being among the buildings destroyed. The people had no time to save anything, and by 7 P. M. 600 houses had been consumed. Montreal sent a steam fire-engine by special train at 7:30 P. M., but was too late to be of much service. Hundreds of families are now homeless and without food. The loss is roughly estimated at $2,000,000. The Royal, Stadacona, Quebec, Provincial and Royal Canadian insurance companies are heavily interested. St. Hyacinthe is a post town of Canada East, and is the capital of the County of St. Hyacinthe. It is about thirty miles east-northeast of Montreal.

WEEKLY OUTLOOK.

G. T. complains that prayers for rain are of no avail in his locality, but omits to state the locality. We desire crop reports, but, to be serviceable, County and State must accompany information.

From G. W. G., Christian Co., Mo. In this County the crops are good. There seems to be a plenty of everything. Money is scarce; but the soils have yielded us an abundance of superior wheat and corn. The prices rule low. Tobacco is growing finely. The fruit crop, too, is superior. We have a good country—very fertile and very healthy. We have a good many New York people, also many excellent German and English families. There are splendid opportunities to get homes here. Lands are cheap, fertile and handsomely located. I shall be glad to give information about this country to any person who may contemplate coming here.

Lands for Sale.—One of the choicest farming sections in the country is in Southwest Missouri; and the many people throughout the East and West who are meditating a move cannot do better than settle in this territory. They should, at least, take a tour of inspection; and if, when satisfied with the advantages of the country, they care to purchase, free transportation to the lands will be furnished by the Atlantic and Pacific Railroad Company. There are now 1,200,000 acres for sale in Southwest Missouri, embracing first-class stock farms, excellent agricultural lands, and the best tobacco region in the West. Short winters no grasshoppers, good markets, and a healthy country are the most striking advantages. The land sells at from $2.50 to $10 an acre, with easy payments. For full particulars about these choice lands, write to A. L. DEANE, Land Commissioner, St. Louis, Mo.

INQUIRIES FOR ADVERTISERS.

[OWING to the many inquiries from subscribers concerning things that have a commercial value, and are offered for sale through the medium of newspaper advertising, we have deemed it for the best interest of all concerned, to classify our "Answers to Correspondents," so that each inquiry will appear under its appropriate head, either in "Inquiries for Advertisers," or "Answers to Correspondents." This, we believe, will enable advertisers to more effectually comprehend the wants of our subscribers, and will enable us to make our advertising columns what they should be—a true reflection of our readers' wants. This department will be edited carefully, it being our aim to use it in the interest of both advertisers and readers (and we shall not hesitate to give our reasons for excluding bad or doubtful advertisements) and such other matter as will be of legitimate interest. At the same time it must be understood that such inquiries as may appear must appeal to the advertiser himself for answer. The advertisement should answer the want and the want is indicative of its need.]

R. N., Atlanta, Ga., wants Ayrshire Cattle.

M. E. R., Astabula Co., Ohio, wants Game Fowls.

M. A. Y., Lowden, Iowa, wants a first-class Brick Machine.

R. G., Fairfield County, Conn., wants full-bred Cotswold Sheep.

G. R. B., Manchester, N. H., wants a number of Pure-Bred Game Bantams.

H. A. W., Bucks Co., Pa., wants a cheap and good Ten-Horse Portable Farm Engine.

H. E. V., Clay Co., Va., wants a good Cider Press. We refer him to advertisements in this issue.

H. M. B., Franklin County, N. Y., wants a Chilled Iron Plow, and would like to know which is the best.

R. H. G., Walla Walla, Washington Territory, wants a good Farm Wagon and wishes to know which is the best. We cannot say, as there are now several good wagons manufactured that are sold throughout the country. Some of these manufacturers should advertise.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 2, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	72,200	Molasses	—
Whisky	2,175	Rice, bbls	650
Corn meal, bbls	1,900	Cut meats, pkgs	5,627
Corn meal, bags	330	Lard, pkgs	2,884
Wheat, bush	205,389	Tobacco, hhds	3,194
Corn, bush	186,291	do. pkgs	5,377
Oats, bush	107,707	Butter, pkgs	—
Rye, bush	9,709	Cheese, bxs	66,111
Malt, bush	11,974	Cotton, bales	4,715
Barley, bush	—	Rosin	11,370
Beans, bbls	6,208	Sats, turp., bbls	2,026
Grass seed, bush	9,188	Dried Fruits, pkgs	635
Beef, pkgs	1,161	Eggs, bbls	5,593
Wool, bales	1,329	Peanuts, bags	251
Hops, bales	134	Leather, sides	46,430
Pork, bbls	1,007	Sugar, hhds	—
Tallow	1,093	Oil cake	6,663

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off quill points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEESWAX.—Is slow of sale and at easy prices: Western quoted at 30½@31c.; Southern at 31@31½c. Exports past week 4,017 lbs.; since Jan. 1st, 55,341; same time last year, 58,821 do.

BEANS AND PEAS.—Exports of beans past week, 963 bbls.; since Jan. 1st, 42,811 do.; same time last year, 34,824 do. Exports of peas past week, 1,589 bu.; since Jan. 1st, 474,023 do.; same time last year, 231,314. There has been a decided and sudden improvement in beans, and the market has ruled very strong since its occurrence early in the week. The drop is known to be below the smallest recent estimate, and both interior and city holders are firm. A few samples of new are in market; quality good, but of stunted growth. Green peas steady. Canadian weak.

Beans—Prime pea, $1.15@1.25; fair to good, $1.20@$1.30; prime mediums, $1.25@1.30; fair to good, $1@1.15; poor, —@—c.; prime marrows, $1.70@1.75; fair to good, $1.45@1.60; prime white kid., $1.55@1.60; other, $1.25@1.50; prime red kidney, $1.50@1.55; other, $1.25@1.40; Lima (Cal.), $2.75@3. Black beans, $3.75@4.00. Canadian peas, bulk and bond, 86@87c.; free bbls, $1.14. Green peas, $1.15; split do, $6.

BROOM CORN is depressed and dull. Nothing sensational has transpired in reference to the new crop. From the way the market has run during the past year, almost any yield would seem abundant. Nominal quotations are 5@8c. for short green brush and hurl; 5@6c. for green medium and 3@4c. for red and red tipped.

BUTTER.—The market is not quotably changed, yet the feeling is easier and it is not improbable that a shade in buyers' favor for State will be brought about by the threatened accumulation of stock. We say threatened because trade is somewhat quiet, and the new month will be apt to give us larger daily supplies. Besides buyers can now take longer lots and will of course hesitate at paying the extreme rates that have become current for summer sized parcels. Exporters have again operated heavily. In fact, transactions for their use have exceeded any period from June 1st to date, during the last five years. The market is well cleaned up of under grades, and an agreeable feature is the attention foreign buyers are giving some lines of State. All good serviceable lines of Western have a ready sale at the prices. Some apprehension is felt about the fall yield as pasturage is not looking well in many sections where late made stock is a specialty.

We quote:—Choice pails, 20@—c.; prime, 20@28c.; poor to good, 15@24c.; creamery pails, choice, 30@31c.; good, 28@29c.; sweet cream pails, 25@30c. State firkins, choice, 27@28c.; fair to good, 24@26c.; do. half firkin tubs, choice, 27@28c.; fair to prime, 23@26c.; do. Welsh tubs, choice, 25@27c.; other, 22@24c.; Western creamery, choice, 23@26c.; other, 20@27c.; do. firkins, best, 20@21c.; other, 14@17c.; dairy tubs, choice, 21@23c.; other, 14@16c.; factory choice, 19@21c.; other, 14@16c.

Comparative receipts and exports from June 1st.

	Receipts, pkgs.	Exports, firk.
June 1, '76, to Sept. 1, '76	328,120	25,362
June 1, '75, to Sept. 1, '75	255,114	7,005
June 1, '74, to Sept. 1, '74	241,181	21,618
June 1, '73, to Sept. 1, '73	299,388	11,295
June 1, '72 to Sept. 1, '72	176,122	11,814
June 1, '71, to Sept. 1, '71	179,409	21,828

CHEESE.—There is an advance this week of ½c. on all grades. The demand has been very fair, and fancy factories are closely sold up, with no marked accumulation of other grades. The markets abroad were weak early, but they have since reacted. The cooler weather placing the supplies in better order has led as much as anything else to the improvement. Quotations are:

Fancy factory, 10@10½c.; fine, 9¾@—c.; good and prime, 8¾@9¼c.; fair, 7@7½c.; do. half-skimmed, 5@6c.; do. skimmed, 3@4c. State farm dairy, fancy, 8@8¾c.; good to prime, 7@8c.; fair and good, 6@7c. Western factory, good and prime, 7@8c.; fair lots, 6@7c.; do. cheddar, choice, 8c.; do. flat, choice, 8@8¼c. Exports past week, 64,526 boxes.

Comparative receipts and exports from June 1st:

	Receipts, pkgs.	Exports, pkgs
June 1, '76, to Sept. 1, '76	1,015,464	45,769,285
June 1, '75, to Sept. 1, '75	1,133,765	52,801,085
June 1, '74, to Sept. 1, '74	991,288	57,867,033
June 1, '73, to Sept. 1, '73	999,637	54,553,607
June 1, '72, to Sept. 1, '72	868,558	40,341,565
June 1, '70, to June 1, '71	741,532	36,998,713

COTTON.—There has been a good business in spot lots on export and spinning account, but the favorable crop advices have led to easier prices. The latest quotations are:—September, 11 19-32@11¾; October, 11 7-16@11 15-32c.; November, 11 11-32@11¾c.; December, 11 11-32@11¾c.; January, 11 15-32@11¾c.; February, 11 21-32@11 11-16c.; March, 11 27-32c.; April, 12@12 1-32c.; May, 12 3-16c.; June, 12¾c.; July, 12¾@12 17-32c.; August, 12¾@12 11-16c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9¾	9¾	9¾	9¾
Strict ordinary	9¾	9¾	9¾	9¾

Stained.

Good ordinary	8¾
Strict ordinary	9 15-16
Low middling	10 5-16
Middling	11 3-16

DRIED FRUITS.—New apples are more plenty, and at easy prices. New Tennessee quarters have been placed at 5¼c.; Virginia quarters, 5@6c., according to quality. Peeled peaches are dull; sales in small lots at 14¾c. for prime. Unpeeled peaches are neglected. Cherries and blackberries are firm at the advance.

Apples—State, sliced, 8@8¼c.; do., quarters, 7¼@8c.; southern sliced, new, 7¼@8c.; choice do. at 8@9c.; do., new quarters at 5@6c. Blackberries, 7@7¼c. Peeled peaches, new, nominally 13@15c., as to quality; unpeeled peaches, new, nominal. Plums at 13@15c. Raspberries, 24c. Cherries, 16c.

Exports, past week, 281 bbls. dried apples; since Jan. 1st, 2,441 do.; same time last year, 10,857 do.

EGGS.—Have done well most of the week, falling off a little at the close. The markets will not stand heavy receipts; the intervals of warm days keep buyers away from market.

Near points, 20@23c., State and Penn., 20@21c.; Western, prime, 19c.; do. other, 18@18½c.; Canadian, 18@18½c.

ESSENTIAL OILS.—The following are the latest revised quotations:

Oil peppermint, glass, $3.75; do. tin, $2.90; spearmint, glass, $3.50; do. tin, $2.75; wintergreen, $2.80; sassafras 38c.

FEATHERS dull; prime live geese, 50@55c.; mixed, 35@60c.

FLOUR.—There has been a liberal business from English shippers, brought about mainly through the scarcity of desirable lots of wheat. On shipping grades better rates are made. The general market is stronger and fairly active. We quote:

For poor to very choice superfine State, $3.50@4.25; $4.35 4.65 for very common to fair extra do.; $4.70@4.80 for good extra do.; $4.85@5.15 for fancy do., and $5.20@5.50 for very choice extra; $3.50@4.25 for superfine Michigan Indiana, Iowa, &c.; $4.30@4.60 for shipping extra do., the inside price for inferior, and $4.65@5.15 for choice to very fancy extra do.; good to choice white wheat extras at $5.20@6.50; fancy do. $6.55@7.50; winter wheat, good to choice family city mill extras, $6.00@7.25, round-hoop Ohio, $4.50@4.85, and trade brands of do. at $5.00@6.75; St. Louis, $4.90@6.00 for common to fair extra, and $6.05@8.50 for good to very choice; Minnesota "straight" at $5.60@7.10, and patent at $6.50@9.00; unsound stock at from $2.25@5.60; city mill extra for West Indies at $5.00@5.85; do. English brands, $4.65@4.80; do. trade and family brands, $5.25@5.50; No. 2 at $2.20@3.25. Corn meal—Yellow Western, Jersey and Pennsylvania, $2.55@2.35, Brandywine, $3.25@3.30.

FRESH FRUITS.—Apples have improved, owing to fine quality and the reduced quantity of peaches. Bartlett pears are still cheap. A good many arrive in green condition and a large class of buyers do not know how to put them through the requisite course of ripening, preferring to wait for even nursery lots later on. Several consignments of California pears are here, all shipped to ripen. Sales are forced, and that means irregular prices. The supply includes some large American Russets. They are rather tough-skinned, but their delicious honey-flavor compensates for that fault. The range for California pears is $2.50@3 ₱ box; but their condition is so tender that most all buyers return for reclamation. A good showing of California Golden Drop plums are quoted at $3@3.50 ₱ box; State and Western low. Grapes slow of sale. Melons are doing better. Peaches steady under moderate receipts. Choice yellow brings $2 quick.

Apples, best, double-head bbls., ₱ bbl., $2.50; good to prime, near-by, $1.25@1.75; common, 75c.@$1.25. Peaches, Delaware, fancy, ₱ basket, $2; fair to good, 70c.@$1.50; fair to extra, crate, $1@2.50; N. J., ₱ basket, 30c.@$1.50. Pears, Bartletts, Southern, ₱ bbl., $3@5; Seckel, $3@5; Flemish Beauty, $3@4; cooking, $1.75@2. Plums, California, choice, ₱ box, $3@4; fancy, ₱ bbl., $3@3; good, $7@8; poor, $5.50@6.50. Grapes, Delaware, ₱ lb., 10@14c.; Concord, State and Jersey, 5@8c.; do. Southern, 4@6c.; Hartford, State and Jersey, 4@7c.; Southern, 3½@4½c. Whortleberries, ₱ bush., $1.20@2. Nutmeg melons, Jersey, ₱ bbl., $1@1.50. Watermelons, N. J. and Baltimore, ₱ 100, $8@20. Peanuts have moderate sale when prime; prime to fancy Virginia, $1.10@1.60; common to fair, $1@1.35.

GRAIN.—For wheat the meager supplies of prime lots have limited business. The foreign advices are favorable, but the orders come untimely for sound lots. For these full rates can be made. For the lower grades lower prices are made; latest sales of ungraded spring at 94c.@$1.05; No. 3 Chicago spring at 85c.; No. 2 soft Milwaukee spring at $1.01; new ungraded spring at $1.05; fair No. 1 Minnesota spring at $1.10; old winter red, in store, at 99c.; new winter red Toledo at $1.16; fair old white Michigan at $1.13, and fancy new amber Michigan at $1.27. Corn has been in large supply, and lower; latest sales at 50@53c. for heated and warm, in store and afloat; 53@54½c. for steamer mixed; 55@56½c. for ungraded mixed, the latter for choice; 57@57½c. for Kansas mixed; 54c. for graded western mixed; 56c. for steamer yellow; 57c. for yellow western; 58½c. for southern yellow, on dock; 54c. for white western, and 56½c. on dock for white southern. Oats have been in good demand and at higher prices; sales at 35@42c. for mixed Western and State, and 36@45c. for white do.; mixed Western, in store, at 40½c.; new white Western at 40@45c.; new State at 45c.; No. 2 Chicago, in store at 42c.; No. 2 Milwaukee quoted nominally 41@42c. Rye at 73c. for new Western for first half September.

HAY AND STRAW.—There is a good business in prime hay at firm prices. Shipping lots are hard to sell. Straw is in active demand and favoring the seller.

Bale hay is quoted:—Shipping, 60c.; retail qualities 70@90c.; clover, 55@60c.; salt, 55@60c. Straw is quoted at 70@75c. for long rye; 50@55c. for short rye; 50@60c. for oat.

Exports past week 31 bales; since Jan. 1st, 32,909 do.; same time last year, 31,020 do.

HOPS.—New do not arrive sufficiently as yet to warrant important dealings; in a small way, 25@35c. made. Last year's growth of the better grades have been closely sold up. The market has probably never been in better shape to enter on a new crop. From EMMET WELLS' Weekly Circular, we take the following:—"We have shipped to London during the year, in round numbers, 50,000 bales. In the fall and winter of 1868 and 1869, the shipments were heavier than during the past year; but the business of that season was entirely of a different nature; then hops were shipped and consigned at random, while last year very few hops were exported except on special order from there and at stated prices. The price paid here for good shipping hops during the past year average about 15c. ₱ lb. Very few growers realized even these figures, most purchases being under 15c. The new season gives promise of a much better state of things. Contracts and purchases have already been made for a few thousand bales as high as 25c.; this improvement over last year's opening price is based upon a partial failure of the German crop and a comparatively light crop in England. Early estimates put the new English crop at ⅓ths less than last year; that of Germany ½d of last year's. We will, therefore, be likely to have a call from Germany as well as from England for hops." The quotations are:

N. Y. State, 10@20c.; Eastern, 8@15c.; Wisconsins, 8@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias (nominal), 15@18c. ₱ lb.

POULTRY AND GAME.—There has been a fair trade in live in fowls and chickens; turkeys, ducks and geese active for Jewish holidays. We quote Spring chickens, near-by, ₱ lb., 16@17c.; do. Western, 15c. Fowls, N. J., ₱ lb 15@16c.; do. Western, 14@15c. Roosters, 8@10c.; Turkeys, N. J. 14@15c.; do. Western, 14@15c.; Ducks, N. J., pair, 75c.@$1; do. Western, 65@75c.; Geese, N. J., $2.00@2.50; do. Western, 1.37@1.75.

Dressed poultry nominal. We quote:

Dry-picked chickens, 17@21c.; scalded, 12@17c.; dry-picked fowls, 16@18c.; scalded, 14@16c.; turkeys, 13@17c.

Grouse and partridge are now legally salable. The former have brought 75c. and the latter 90c.@$1 per pair. Woodcock are not so much inquired for now that grouse and partridge are offering, and therefore rule lower. Wild pigeons are no longer arriving in sufficient quantity to be quotable.

Partridges, ₱ pair, 87c.@$1; grouse, do., 75c.; woodcock, State, do., 75@85c.; Western, do., 70@75c.

PROVISIONS.—There is a very good export demand. Mess pork quoted at $16.75 for spot lots, $16.55 for October, and $15.50 for December. Bacon, long clear, 9⅝@9¾c.; short do., 9¾c. Western steam lard at $10.15 for spot, September and October, $9.55 for November and $9.42½ for December. Stearine at 12¾c. for prime Western. Beef hams at $26@28 for choice. Tallow at 8¾@8 7-17c. for prime. Barreled beef at $8@10 for plain mess, $10@11 for extra mess, $11@12 for packet, the outside prices for small lots choice. Tierced quoted nominal for prime mess and India mess. City extra India mess at $19.

SEED.—Small lots of new have been received. Timothy, car lots, $2; flower seed, $1.40@1.43.

SUNDRIES.—Ginseng, ₱ lb., Southern, $1.15@1.30; Seneca root, 75c. Cider, ordinary to refined, 14@18c. ₱ gal.; cider vinegar, 18@25c. Sheep skins clipped, 30@35c.; do. unclipped, 50c.@$1; lamb skins, 60@65c.

TOBACCO.—The export demand has been brisk and at strong figures. The quotations are:

KENTUCKY LEAF—NEW CROP.

	Light.	Heavy.
Common lugs	6 @ 6¾	7 @ 8
Good lugs	7¾@ 9	8¾@ 9¾
Low leaf	9¾@10¾	10 @11

VEGETABLES.—Potatoes are now coming from all parts and prices are tending downward. Choice Eastern Early Rose only bring $3. Complaints are still being made about the careless packing of Western. Sweet potatoes low, but the improved quality keeps them active. Corn is in good demand. Tomatoes have advanced. We quote:

Early Rose potatoes, choice, $2.75@3; fair, $2@2.50. Western do., $2@2.50; Sweet do., $2.75@3. Onions, red and yellow, $1.25@1.75; white, $2@2.25. Marrow squash, ₱ bbl., $1@1.25. Cabbages, ₱ 100, $6@10. Tomatoes, ₱ bush. 50@90c. Corn, ₱ 100, $1@1.50. Wax beans, ₱ bag, $1@1.25; Lima do., 75c.; shelled do., ₱ bush, $3. Egg plants, $1. Russia turnips, $1@1.25.

WOOL.—There has been a liberal margin from manufacturers, and prices are again ½c. higher. X Ohio fleeces selling at 40c. and XX do. 42c.; pieklock, 46@48c. Unwashed Western fleeces sold at 24@25c.; Western do., 29@33c. including N. Y.; State fleeces, 33½c. Spring California at 17½@28; Oregon at 28c.

ROCHESTER, Sept. 2.—Flour market active; spring, $6.50; amber winter, $6.75; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.00. Wheat lower: Milwaukee club, $1.16@1.18; amber winter, $1.00@1.05; white winter, $1.05@1.15. Oats, nominal at 30@33c. Corn quiet at 58@62c. Corn meal, $1.25@1.50. Butter, 20@22c. Cheese, 10c@12c. Eggs, 15@16c. Lard, 11¾@12¾c. Apples, bu., 50@75c. Potatoes, bu., 65@75c. Beans, ₱ bu., 70c.@$1. Mess pork, $21.00. Wool, 20@25c. Hay, $8@11. Straw, $5@8. Timothy seed, $2.75@3.50; clover, $9.25@10. Mill feed strong at $16 for shorts, $13 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 40c. ₱ bbl.; to New York, 30c.; to Albany, 25c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Sept. 2, 1876.

THERE has been a more active market this week for cheese and prices have advanced a trifle. The general impression is that we have seen the lowest rates for the season and that fine goods will advance, and this opinion is predicated upon the fact of drought prevailing over an extensive area and the consequent shrinkage of the cheese crop.

About 500 boxes of farm dairy cheese were on the market and sales were made at 7@9¾c., the latter figure having been reached by only a few lots. The bulk of sales may be quoted at 8@8¾c.

The offerings from factories were estimated at 12,000 boxes and upward, the larger part of which changed hands. Sales were made at 9c., 9¼c., 9¾c., 9¾@10c., while the highest price reached by "fancy" was 10¼c. The bulk of sales may be quoted at 9¾@10c.

The weather is cooler, but the delivery of butter this week has been light. Farm dairy butter in Welsh tubs sold at 23@24c., while creamery was reported to reach from 25c. to 27c.

We have recent advices from abroad. Our London correspondent says fine English cheese is in demand. The low price of American cheese secures a large consumption; extra fine is short and sought for. We give prices as follows:

American, extra fine, 51s.; fine, 50@52s.; good, 46@48s.; secondary, 36@44s. English cheddar, 76@82s.; Wiltshire double, 63@72s.; Cheshire medium, 50@58s.; fine, 66@76s.; Scotch, 56@64s. Dutch cheese—Edams, 52@54s.; Gondas, 50@52s.; Derby shapes, 52@54s.

Butter is in good demand and the tendency of the market is upward. The quotations are as follows:

Cloonmels, 130@132s.; Corks, 132s.; Jersey, 100@120s.; Dorsets, 150@154s.; Friesland, 128@140s.; Normandy, extra, 100@140s.; American and Canadian, 95@100s. ₱ cwt.

Oleomargarine (artificial butter) sells at from 90s. to 96s. ₱ cwt., according to quality.

LIVE STOCK MARKETS.

NEW YORK, Sept. 2, 1876.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Sixtieth St.	3,996	10	1,905	11,883	000
Forty-Eighth St.	37	26	513	3,312	000
Fortieth St.	000	00	000	000	3,818
Harsimus Cove	4,582	00	000	15,001	9,039

" last week	8,715	72	2,696	25,583	17,504

BEEVES.—Trade opened on Monday last slow but firm, the run of horned cattle was light, and all to hand were sold off from 7¾@10½c. ₱ lb.; weights, 4¾@8¾ cwt. The quality of these herds were generally coarse, the aggregate being grass-fed. Wednesday, trade was slow on a light run; quality generally very coarse; prices, 7¾@10¼c., weights, 5@8 cwt., Thursday, trade small at 8¾@10c.; weights, 5¾@8 cwt. Friday, the markets closed weak at 7¾@10¼c.; weights, 5¼@8¾ cwt. From 58@57 lbs., net, have been allowed; general sales on 56 lbs. net. The quality of these herds were from poor and rough grass-fed animals to coarse and fat steers. Only a very few good quality steers came to hand and these were all sold off at retail on a small advance on above quotations. Spanish herds, grass-fed, sold at 7¾@8¾c. ₱ lb.; grass-fed native steers, 8@9c.; part corn-fed do., 9¾@9¾c., with tops at 10c.; grade do., 10¼@10¾c.

Comparative Rates.

Quality.	This week. Cents.	Last week. Cents.
Good	11 @	11 @
Fair	10¾@	10¾@10¾
Poor	9¾@10¼	9¾@10¼
Poorest	7¾@ 9	5¾@10¼
Gen. selling rates	8¾@ 9¾	8 @ 9¾

MILCH COWS.—Trade so small and slow that dealers withhold quotations. Two cows sold for $70@72 ₱ head—calves included.

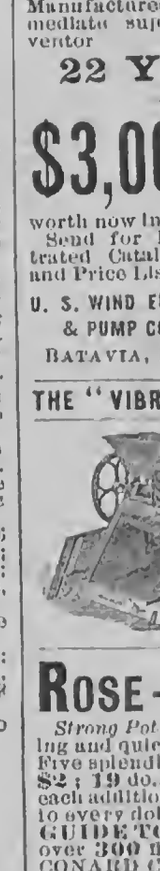
VEALS AND CALVES.—Trade slow in coarse quality calves and moderate in smooth quality veals. Calves, part buttermilk-fed, sold at 3¾@5¾c. ₱ lb. Grass-fed calves at $5@12 ₱ head. Smooth quality veals at 7@8¾c. ₱ lb., with a few selected animals at 9c. State calves sold at 3¾@6¾c.; Pennsylvania do., very coarse and heavy, at 3¾@4c. State veals at 7@8¾c.; Pennsylvania do., 7¾@8¾c.; Jersey do., 7¾@9c.

SHEEP AND LAMBS.—Trade slow but steady in sheep. Lambs slow and declining in value. The quality of the flocks to hand has been from coarse to good—in general fair. Monday last sheep sold at 4@5¾c. ₱ lb.; lambs at 5@7c.; mixed flocks, 4@6c. Wednesday, sheep, 4@5¾c.; lambs, 5@7c. Thursday, sheep, 4½@6¾c.; lambs, 4½@6¾c. Friday, the markets closed firm; sheep, 4¾@6¾c.; lambs, 5@6¾c. State sheep, 4@5¾c.; Michigan do., 4¾c.; Pennsylvania do., 4@5c.; Ohio do., including mucks, 4@5¾c.; Canada do., 5¾@5¾c. Canada lambs, 6¾@7¾c.; Kentucky do., 5¾@6¾c.; Virginia do., 5@7¼c.; State do., 5¾@6¾c.; Jersey do., 7c.

HOGS.—Ohio hogs, live weight, 260 lbs. ₱ head, sold at $6.57½ cwt. State hogs, 207 lbs. ₱ head, sold at 6¾c. ₱ lb.; only 41 head were sold in all. City dressed trade active on a light run, which causes rates to advance; 7¾@8¾c., extreme range, save a few selected pigs at 9c. On the close of the sales, rates were weak.

HORSE MARKET.—City trade easier in inferior quality horses. Fifty poor quality light harness horses sold at $30@100 ₱ head; 20 do., $50@95 ₱ head; 43 ordinary quality do., $110@175 ₱ head; 40 coarse quality heavy draft do., $115@182 ₱ head; 10 pairs family carriage horses, $325@495 ₱ pair; 11 ponies, $12@200 ₱ head; 8 roadsters, with moderate trotting action, $200@400 ₱ head; 1 pair light carriage horses, aged, $700.

New Advertisements.



What will the Weather BE TO-MORROW? THE Signal Service Barometer WILL TELL YOU.

It will detect and indicate correctly any change in the weather 12 to 24 hours in advance. It will tell what kind of a storm is approaching, and from what quarter it comes—invaluable to navigators.

FARMERS

can plan their work according to its predictions. It will save 50 times its cost in a single season. There is an accurate thermometer attached, which alone is worth the price of the combination. Will send it express paid to any address on receipt of **$2.00.** Send Money Order or Registered Letter.

Agents wanted—send stamp for Circular. **H. W. POOL & CO., 835 Broadway, New York.**

The Boston Traveller says:—"We carefully inspected the above-described Signal Service Barometer, and found it to be as stated by Messrs. Pool & Co., who are honorable and reliable."

FEW children go to Saratoga Springs.

IN England the stylish beverage is snowed milk.

MISS BRADDON, the novelist, is to go on the stage.

NINE railroads are in process of construction in Texas.

A NEW theater in New Zealand was opened by Ilma di Murska.

YOUNG ladies in blue flannel in Wisconsin swim across half-mile-wide lakes.

SENATOR EDMUNDS is ill and has gone to Canada, away from State committees.

BEN BUTLER in his new role of a "widow," makes the country laugh all over its face.

IT is rumored in London that Father Hyacinthe is about to enter the Church of England.

ROSES have done blowing this season, and so have members of Congress at Washington.

"I HAIN'T heern one this year," laments Mrs. Partington, "not one Bacchanallan sermon!"

RANDOLPH ROGERS, who goes back to Rome next month, thinks of returning to Washington to live.

LONGFELLOW:—"The sunshine of life is made up of very few beams that are bright all the time."

A RECENT fancy makes car-rings of black velvet and watered ribbon, held in place by small buckles.

SEVENTY car loads of machinery, for the cotton mill now building at Atlanta, Ga., were received there recently.

GEN. LEW. WALLACE is writing a new novel. His first attempt, "The Fair God," has reached its sixth edition.

CÆSAR conquered the world, but he could not hit a fly on his nose three times in five, any more than the rest of us.

THE jail at Exeter, N. H., is so full of prisoners that there is talk of organizing chain gangs for work on the streets.

A RICH vein of coal has been discovered under an Alabama cemetery. It is supposed to be of the buy-tomb-inous kind.

SPECIMEN postage stamps from Persia and Iceland have just been, for the first time, received at the Washington Department.

MR. LARKIN G. MEADE, the sculptor, and his sister the wife of Mr. W. D. Howells of The Atlantic, are cousins of Gov. Hayes.

IT is reported that, while Alfred Tennyson is a spiritualist, Mrs. Tennyson is not, and forbids all mention of the subject at her hearth.

SAN JOSE, Cal., has been sued by a Fourth of July orator, who wants $1,000 for speaking his piece, while the city offers him but $10.

A COLORED woman has received the appointment of postmistress at Terry, Miss., in the place of Mr. Seals, a white Democrat removed.

AN insectologer has discovered that the best time to examine the wonderful architecture of the hornet's nest is after the hornets have moved out.

WHAT effect does cutting off a dog's tail have on his locomotion? It has no effect on his carriage but stops his waggin'.—*New Orleans Picayune.*

PRESIDENT and Madame MacMahon were run away with recently, and were saved by a prompt and active grocer, who jumped at the horses' heads.

A PRIZE of $500 is offered by the Georgia State Agricultural Society for a preventive or cure of hog cholera; and another of $200 for chicken cholera.

A GREAT exhibition of sacred objects will be opened in the Vatican on May 21, 1877, in celebration of the jubilee of the Pope's elevation to the Episcopate.

"WHAT does 'Good Friday' mean?" asked one schoolboy of another. "You had better go home and read your 'Robinson Crusoe,'" was the withering reply.

PH. D. is the title under which the studious dame, Madame Sophie Goldsmith, has been received by the Faculty of Philosophy at the University of Zurich.

JOSEPH PITMAN, the last survivor of Napoleon's custodians at St. Helena, has died in England in his ninety-third year, having been a pensioner for full fifty years.

SEEDY tramp—gazing at a railroad hand bill: "Through without change! That's the line for me," and he proceeded to ensconse himself in an empty freight car.

THE Sultan begins to think of getting well, and, according to official report, one symptom appears to be that he is "becoming communicative, as he was in his youth."

A PHYSICIAN advertises in the Meriden, Conn., newspapers that he has no power over his appetite for alcohol, and that he will prosecute anybody who sells him any.

A SIXTEEN year old boy robbed his employer in Philadelphia, and went to Chicago, where he spent the money so riotously that the police arrested him on suspicion.

A BILL passed by the Texas Legislature, authorizing Sheriffs to shoot any person against whom any offence is alleged, if he should fail to halt or surrender when called upon, was vetoed by Gov. Coke.

INDIGNANT husband—I suppose I have the liberty of speaking my mind? Truthful wife—Yes, John; but if you had nothing but your mind to speak, you'd be always dumb.

AT a medical examination a young applicant for a physician's diploma was asked:—"When does mortification ensue?" "When you propose and are rejected," was the reply.

MR. GEORGE NORTON, an Italian of English descent, and who was formerly an editor of the *Eco d' Italia* of this city, is now prominent and popular among the journalists of Rome.

THE best men know that they are very far from what they ought to be, and the very worst think that, if they were a little better, they should be as good as they need be.—*Froude.*

MR. WILLIAM BLACK, the brilliant English novelist, is in this country on a visit of two months. He is now at Saratoga, and will visit Niagara and Boston before returning to New York.

WHEN Dom Pedro was in this city, Fall River sent its Mayor and another citizen to induce him to pay a visit, but the mission failed, and the Common Council hesitates about paying $256 for the expenses.

THE handsomest Hebrew roll in the United States—the five books of Moses written on parchment—has been presented by Sir Moses Montefiore to a Bostonian, and was dedicated on the 8d of September.

A BOOK agent was recently shot in Texas, whereupon the Worcester Press heartlessly and malignantly remarks that "there is a universal demand all over the country for more book agents—in Texas."

MISS PITMAN is a cousin of the King of the Cannibal Islands—that is, King Kalakaua—and she swims exceedingly well off the coast of Martha's Vineyard this summer, and is reverentially called "the Island Princess."

AMONG the arrivals by the steamship St. Laurent from Havre was M. Charles Limousin of the Paris *Journal des Debats*, a notable addition to the list of European journalists and writers whom the Exposition has brought here.

OVER the new Earl of Beaconsfield all the London papers pour forth what Willis termed "platitudinous commonplaces." They agree in stately language that his promotion is the crown of his career—and so shelve him.

THE son of the washerwoman with whom Byron lived in Venice, before he resolved to study the Armenian language as a means of avoiding dissipation, is now the proprietor of the Hotel de Lepre, a well-known restaurant in Rome.

"I CAN scarcely breathe, because I have stuffed so many of my diamonds in the waist of my dress. I cannot wear them all at once, and I am afraid to leave any in my room." Thus spake a watering-place belle the other day. Isn't it sad?

THE Rev. Dr. Cuyler, who has been to the Adirondacks, complains of a signboard that he saw there, near the grave of John Brown, which said:—"To John Brown's Home—fresh trout, chickens, and lodgings always supplied!"

A STRANGE marriage took place at New London recently. When the ceremony was finished, the bridegroom refused to fee the clergyman or to allow his wife to be kissed, and told her to go her way and he would go his, which they both did.

HERR WAGNER appears to have enthusiastic literary tastes. He was so delighted with a Life of Schopenhauer, lately published by an English lady, that he sent her a ticket for the Bayreuth performances—not a small item by any means.

THE following was written on the window of an inn, in 1714:

"Who'er has traveled life's dull round,
Where'er his stages may have been,
May sigh to think he still has found
His warmest welcome at an inn."

LOW-NECKED dresses are the fashion at the Buckingham Palace entertainments; but a Countess recently wrote to the Lord Chamberlain that her shoulders had grown so thin during long illness that they were not "really fit to be seen," and she was allowed to violate usage.

PROF. SUMNER intends to read a paper on the commercial crisis of 1819, at the coming meeting of the Social Science Association, over whose deliberations he will preside. David A. Wells is to discourse on a subject of more immediate interest, the Cause and Cure of the Present Hard Times.

BERNARD MCNULTY of Everett, Mass., has for three months been inciting boys to steal, and then informing the police where the plunder could be found. By this means he has kept the village excited, and got himself and the boys imprisoned. No sane motive for his conduct is apparent.

THE Dowager Lady Lytton, the widow of the novelist, and in her youth the black-browed, scowling, Oriental beauty, Miss Wheeler, has published a volume of meditations with the somewhat sentimental title, "Shells from the Sands of Time." Therein she discusses with satisfaction what she calls the "stuckupativeness" of the modern servant.

MR. ROBERT BROWNING, who is not celebrated for sweet humility, in his new volume, "Pacchiarotto," calls the British reviewers "chimney-sweeps," and gets in return this rap among others from The Saturday Review:—"He challenges all who presume to form and express an independent judgment of his poems in language so unprovoked, so unreasonable, and so coarse that it would be almost an act of cowardice not to answer his defiance."

Implements and Machinery.

Centennial Year of American Independence,

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you samples of the Celebrated Watches, manufactured by our countrymen, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION. These Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, fine Ruby Jeweled, set in Clinton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

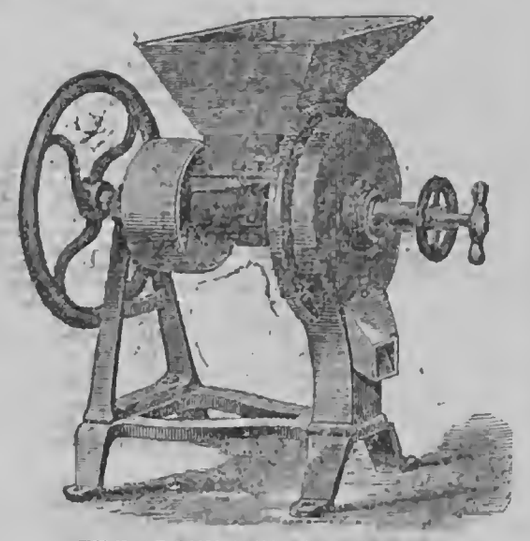
SEC'Y BERGEN CO. POULTRY ASSOCIATION,
Ridgewood, Bergen Co., N. J.

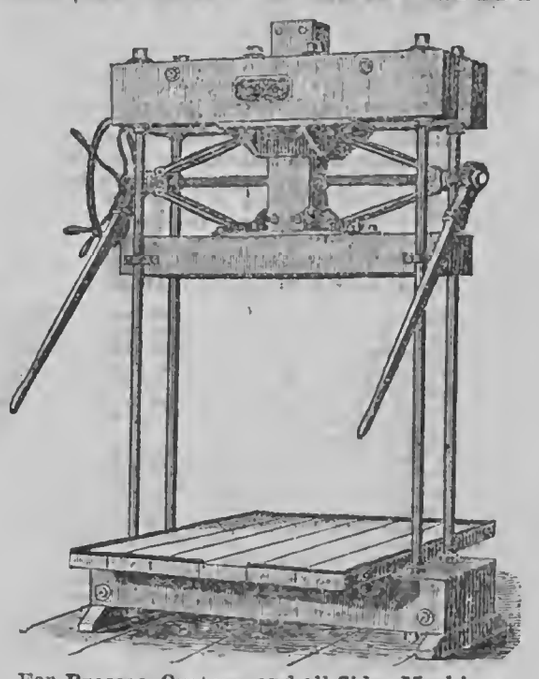


THE ABOVE CUT REPRESENTS
THE VICTORY CORN MILL.

This mill will grind corn and cob rapidly, course and fine; also, all other kinds of grain or seed. Capacity, **10 to 20 bushels per hour.** It is made entirely of iron, except the hopper. It is strong, durable, and not liable to get out of repair. It will grind more feed with less power than any other mill in the market. This is no humbug. We warrant it to do what we claim. Agents wanted everywhere. Price $40, delivered on cars at Springfield. Address
T. ROBERTS & CO., Springfield, Ohio.

☞ We also manufacture 4½ horse-power Vertical Portable Engines, suitable for running these mills, or for any other purpose for which power is required. Price $260.

CIDER PRESS.



For Presses, Graters, and all Cider Machinery, address
BOOMER & BOSCHERT PRESS CO.,
Syracuse, N. Y.

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend as a present, at our lowest club rate—only $2.15, including postage.

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer. It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.*

Inquirer.—You have in several articles used the words endosmose, exosmose and osmose, in speaking of the effects of frost upon trees. Will you please explain them? ANS.—The word osmose embraces the other terms. It is the tendency of two liquids of different densities to mix when separated by permeable membranes or tissues. If, for instance, sugar or salt be dissolved in water in a glass tube and a bladder be tied over the mouth and inserted into another vessel of pure water, it will be found not only that the pure water enters the tube, but that the denser liquid of the tube passes through the membrane into the water. And this interchange continues until both are of the same density. The passage of the pure water into the tube is called endosmose, and the passage of the salt or sweet water into the other is called exosmose. The upward course of the sap is induced by evaporation from the leaves and stems, which, tending to produce vacuums, is reproduced by those beneath until the roots are called upon to act. Thus the movement of sap in the spring is accelerated. But osmotic movement occurs in all directions, and has, perhaps, less to do with the pressure of the atmosphere.

The rationale of these forces in their relations to the processes of plant life are but imperfectly understood.

Farmer Boy.—If you will send us a specimen of what you call the "Grain Weevil," we shall endeavor to give the scientific name, together with whatever is known of its history and the method of destroying it. But as there are many kinds of insects which attack stored grain, some being moths and others beetles, it is absolutely necessary that we should see a specimen of the insect in question before attempting to give any special information in regard to the same. To speak of all kinds of insects which invest grain as "the weevil" is as incorrect as it would be to call all farm animals "the horse," and yet hundreds do talk in this loose manner without being aware of their error.

C. F. B.—No, never transplant evergreens in the fall if it can well be avoided. It may sometimes do to move evergreens in the fall where they can be handled with a ball of earth left around the roots, but otherwise to transplant such trees in a cold climate at that season would be almost certain death.

W. B. A.—The immense hornet or wasp with yellow legs and wings and three bands of yellow across the top of its abdomen is one of our large burying wasps, known as *Stizus speciosus*. It frequently captures *Cicadas*, insects much larger than itself. We will have something further to say of this insect in our Entomological columns shortly.

Unbeliever.—There are persons who believe that wheat will turn to chess, and it would be very difficult to change their belief. We have met farmers who claimed that oats, if sown in the fall, would all change to chess, and lately an account comes to us from California of one field of wheat turning to timothy, and another of 140 acres turning to chess, while a volunteer crop of barley turned to red clover. Now, our own belief in this matter is that one change is just as likely to occur as another, and we would as soon expect to see a field of barley turn to clover as wheat to chess. There is no more use in trying to account for strange "beliefs" than there is for curious "tastes."

C. B.—There can be no doubt that lawns which are shaven short by the lawn-mower through spring and summer become impoverished, and the addition of manure or of fresh soil is rendered, sooner or later, necessary. The cut grass should not be raked off, and the use of the lawn-mower should be discontinued so early in the fall as to admit of a considerable growth before hard frosts. This serves as a mulch during the winter and, by its decay, as a fertilizer the ensuing season. Before the last cutting, all plantains and weeds should be pulled up by the roots and all bare places mellowed and sown with lawn seed.

Rockland.—The plant you send is sometimes called Sour Grass. The leaves do possess a rather pleasant acidity. It is readily recognized by its halberd-shaped leaves. It may be kept down by the lawn-mower—otherwise pulling it up by the roots must be resorted to. The botanical name is *Rumex acetocella*. It belongs to the Buckwheat family, *Polygonaceæ*.

C. D. B.—Your weed economy is faulty, we think, or we should find place for your article. If plants extracted from the earth their entire nutriment, all cultivated lands, not manured, would soon become exhausted. But inasmuch as plants draw from the atmosphere a considerable amount of food, it follows that if the entire plant be returned to the soil, the soil will be a gainer by just so much as the plant was fed by the air. If you burn your weeds, you save the ashes and lose the combustible constituents. If you leave them upon the ground where pulled up, simply a slower combustion is the result.

J. O. Bogart.—We cannot now give full directions as to building an ice-house. They may be found in old issues. Let us say, however, that the material, cost, etc., are secondary considerations, unless you care more for ornament than for service. The finer the material used for packing between the walls of an ice-house the better, provided it is not of a cohesive nature. Hence pulverized charcoal is one of the best. There is nothing whatever gained by having the house under or partly under the ground. Indeed the freest circulation of air about the structure is essential, since the material used as a non-conductor loses this power to a great extent the moment it becomes wet or even damp. Dampness forms a communication between the particles which should be separated by dry air. Dry saw-dust is very good and cheap. But unless the walls are air-tight, it absorbs moisture and becomes worthless. It should always be well dried in the sun before being packed. Many suppose that a northern exposure is best for ice-houses. So it would be if the use of non-conducting substances were unnecessary. But unless the ice-house be constructed with exceeding care, the dampness of such places not exposed to the sun penetrates the non-conducting substance and renders it next to useless. The effects of sunshine and free air cannot reach the ice in a properly-constructed house, and they exert a drying and preserving influence upon the material to which we must look for its preservation.

T. D. C., Dentonsville, L. I.—For a strictly ornamental hedge we cannot recommend the Rose of Sharon, *Hibiscus Syriacus*, though it is a beautiful plant and blooms late in the season, when choice flowers are scarce. It is not quite hardy enough for your section.

We prefer the Kittatinny to the Lawton Blackberry, because it is sweeter and hardier. The berries are not quite so large.

L. G.—Rhododendrons are incomparable in their season of bloom—but they are not adapted to places which it is desired in a measure to conceal by an exuberance of foliage. They bloom more profusely when partly exposed to the sun—though the foliage is perhaps improved by shade.

It is our opinion that they are preeminently suited to clusters. Their form is too skeleton-like for single specimens.

(2.) Running Roses are very frequently employed as vines for verandahs or the sides of houses. They are the last plants we should use for this purpose. Too many insects are fond of rose leaves, and unless great care and a deal of trouble be taken, they are eaten up as soon as they are well developed—and the plants present anything but a pleasing appearance. We should prefer the Wistaria, American Ivy, Honeysuckles, *Akebia quinata*, all of which are perfectly hardy, may be trained to suit the taste, and are not liable to suffer from insect depredations.

(3.) We recommend for three grape vines The Lady (a seedling of Concord—white), Concord (black), Roger's No. 1.

Will Mr. FRANK J. SCOTT send his address to the RURAL NEW-YORKER?

Mrs. W. V. B.—I would like to inquire through the RURAL if the large, green worms found on tomatoes are poisonous. Many folks think they are and destroy their vines in consequence. These worms are very numerous on our vines. I cannot think they are poisonous, as they live and grow on nothing but tomatoes, still I would like to be certain. To what kind of a butterfly do they change? I have tried to keep some, but have not as yet succeeded. I would be glad to find out if not too much trouble and would be grateful for any information tending to solve the above queries. ANS.—They are not at all poisonous. In the fall these worms descend to the ground and change to a chrysalis, in which state they remain until spring, when they come forth a large moth, known as the five-spotted sphinx moth (*Sphinx quinquemaculata*).

PLEASE NOTICE.—The note at the head of these columns has been rendered necessary for the reason that we are constantly receiving questions and other communications not accompanied with the writers' name or address. Not only are the name and address essential to protect us from imposition, but it is not unfrequently the case that we wish to communicate with our correspondents.

Hereafter our friends may know that we shall not answer questions or publish MSS. unless the above requirements be complied with.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

MOORE'S RURAL NEW-YORKER.—This king of Agricultural papers has entered upon its twenty-sixth year, under the most favorable auspices. It is the determination of its publishers to furnish a brighter and better paper than ever. In style, type, matter and editorial ability, there is no paper of its kind that at all compares with it.—*Trempealeau (Wis.) Republican.*

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

Wit and Humor.

FORCED TO BE A LIAR.

An agent for the sale of a new kerosene lamp chimney called into a house on Chestnut Street the other day, says the Detroit Free Press, to make a sale. He satisfied the woman that it was a good thing, and then she asked:

"How much kerosene will it save?"

"I think it will save some," was his evasive answer.

"What per cent. of fuel will it save?" she next demanded.

"Why—why—what has fuel to do with a kerosene lamp?"

"All right, you can go," said she. "There was a man along here yesterday with a chimney, which he warranted to save half the oil and forty per cent. in fuel, and you can take your goods and go home!"

He sold one of his chimneys in that house, but when he reached the street great beads of perspiration stood on his forehead, and he said: "She wanted to be lied to, and I lied, and now I've got to keep on lying and lose my soul for the sake of selling lamp chimneys!"

Epitaph upon Richard Button, Esq.:

Oh, Sun, Moon, Stars, and ye Celestial Poles!
Are graves then dwindled into *Button-holes?*

A father bent on instructing his three-year-old son said:—"If you had three apples and should give me one, how many would you have left?" "I wouldn't do it pa," was the prompt reply.

At a young ladies' seminary, during an examination in history, one of the pupils was interrogated, "Mary, did Martin Luther die a natural death?" "No," was the reply, "he was excommunicated."

The King of Holland is not a miser. The other day, when a laborer stopped the royal carriage from going in the river, the King handed him forty cents, and smiled a smile worth thirty-five cents more.

A country editor is responsible for the suggestion that in this degenerate age it would be well to have church-wardens and deacons each provided with a bell-punch when they pass around the contribution boxes.

Intelligent housemaid—"Oh, please, miss, there was a young gentleman called when you was out. He didn't leave no card, miss, but I can show you who he is, 'cause there's three of his photygraphs in your album."

A Glasgow antiquary recently visited an old castle, and asked one of the villagers if he knew anything of an old story about the building. "Ay," said the rustic, "there was anither auld story, but it fell down lang syne."

A Frenchman who has lived in America for some years, says:—"When they build a railroad the first thing they do is to break ground. This is done with great ceremony. Then they break the stockholders. This is done without ceremony."

Hard Times.—"These are pretty hard times, I tell you, sir," complained a tramp, drawing the back of his hand across his eyes while he shut the other upon a donation of 10 cents. "Lots of families who'd never thought, a year ago, that they could mix up biscuit without cream, now use water," saying which, he sorrowfully wended his way to the nearest barroom.

Paris Kentuckian:—Last Friday, when the chain gang was at work on our square, one of the darkeys was approached by a rural acquaintance, who asked:—"What do you have that ball chained to you for?" "So that no derned country nigger can steal it from me," replied the darkey, and went on reducing the size of the limestone rocks in front of him with his hammer.

Brooklyn Argus:—A simple peasant from the wilds of New England was alighting from the cars at the Washington depot, in company with a friend, when the latter pointed out the first distinguished looking person he saw, and exclaimed:—"Look, George! there goes one of the greatest statesmen in this country," "Dew tell!" ejaculated the simple peasant. "How much has he stolen?"

AILANTHUS SILK-WORM MOTH.
(Attacus Cynthia.—Drury.)

The oft-repeated attempts to rear the genuine silk-worm (*Bombyx mori*) with profit, together with the inglorious failure of those engaged in the enterprise, are probably well known to the readers of the Rural New-Yorker. Perhaps we might, for the sake of "keeping peace in the family," qualify the above by saying *all attempts in former years*, because in Kansas and California there are at the present time parties engaged in sericulture who claim to be meeting with fair, if not great success. But there has always been so much of the "speculative" element introduced with every attempt at producing silk in this country, accompanied by exaggerated statements of prospective profits, that close-calculating, practical men, who, of all others, are most likely to succeed in any new enterprise, became distrustful and would have nothing to do with it.

The principal difficulty, however, in the way of making sericulture a success in this country, even where the worms thrived and food could be raised in abundance, was the high price and scarcity of labor, and these barriers, in a great measure, still remain, and another has of late appeared in the form of a disease among the worms, which, from present indications, will become quite formidable. Sericulturists, however, having had such poor success in their attempts to rear with profit the small and rather delicate *B. mori*, or true silk-worm, it was but natural that they should endeavor to find larger and more robust species. Such were known to be quite numerous in China and Japan, and it was quite an easy matter to import a few eggs of the most promising and give them a trial. The first to be introduced into the Eastern States was the Ailanthus silk-worm (*Attacus cynthia*). Although this insect was known to the missionaries in the East for a century, besides being described by Drury in 1773, its habits were unknown to the scientific world until 1857. In 1861 it was introduced into Philadelphia by Dr. Thos. Stewardson, who found no difficulty in rearing it in confinement or upon the Ailanthus trees growing in the streets of that city. It soon became disseminated in nearly all of our Eastern cities and in some of the Western, for wherever the Ailanthus tree thrived this insect seemed to be at home. Two broods could readily be reared in a season in the Middle States, and there was for a while every appearance of success in this new enterprise. But when the cocoons had been produced, it was found that there was one serious obstacle in the way of utilizing them. The silk of which they were composed was not only inferior to that of the old Mulberry worm, but the threads were attached together with such a tenacious gluten that they could not be successfully unwound.

A few experiments sufficed to show that the Ailanthus silk-worm was a failure in so far as being of any practical utility. It increased, however, very rapidly, and soon was looked upon as a nuisance, for the great, green, spine-covcovered worms stripped the leaves from the Ailanthus trees planted along the streets for shade, and many of them falling to the sidewalks, were crushed by the passer-by. In the fall and winter the bare twigs of the trees were ornamented by thousands of the long, silken cocoons, from which there issued the following spring a large and handsome buff-colored moth, ornamented with white malkins, as shown in the accompanying illustration. The rapidity with which this insect multiplied for the first few years after its introduction was equalled only by its almost total disappearance from those cities where it had been the most abundant. This was especially the case in Brooklyn, N. Y., where it almost totally destroyed the Ailanthus trees one season, and the next it could scarcely be found. The destruction of this moth was attributed to the presence of the English sparrow, and while we are willing to concede that they helped in the matter, we are quite satisfied that some parasitic enemy played the most successful part in reducing the number. We are more inclined to believe it was a parasite that destroyed the Ailanthus worms a few years since, from the fact that the worms are again becoming numerous in localities where the sparrows are very abundant. Since the introduction of the Ailanthus, other large species of silk-worms have been obtained from Japan, among the most noted of which we may name the Yama-mai (*Attacus yama-mai*) and Pernyi (*Attacus Perni*). These are both oak-feeding species. The silk they produce is coarser, but stronger and more valuable, than that of the Ailanthus worm. There have been several importations of the eggs of these species, but few succeeded in obtaining any cocoons, as the worms were attacked by some disease before reaching maturity.

The late rise in the prices of silk, caused by the spread of disease among the silk-worms in nearly all silk-producing countries, not excepting China, will doubtless lead to further experiments with the larger species we have named above, and perhaps with some of our native kinds, for we have several which produce a strong thread, although difficult to unwind; but Yankee ingenuity may yet devise some means to unravel their tangled cocoons, or at least to make a good article of corded silk therefrom. One of the most common, as well as largest, of our native silk-worms is the Cecropia silk-worm (*Attacus Cecropia*). The moth is of immense size, the wings spreading nearly or quite six inches. The principal or ground color is a dusky brown, with hind margins clay-yellow, and near the middle of each wing there is an opaque, kidney-shaped white spot, as shown in Fig. 2 on page 184. The cocoons of this moth are generally found attached to some twig of currant bush or other shrub, where they remain all winter. The usual size and form is shown in Fig. 3, on same page. The silk of which these cocoons are formed is exceedingly tough, and, as we have said, cannot be unwound by ordinary processes, but it can be corded and utilized in this way. There is no telling what may be done with this and other native species of silk-worms in the future; but we can experiment, watch and wait for further developments.

AILANTHUS SILK-WORM MOTH.

Arboricultural.

THE NEWER CONIFERÆ.

BY JOSIAH HOOPES.

Believing that there is a growing demand for the newer and rarer species of Evergreens belonging to the great natural order Coniferæ, the following has been prepared for the purpose of assisting those whose individual experience has been limited. It is not intended to embrace all the most beautiful kinds known to botanists, nor yet the many elegant forms of our older species, that have been recently introduced to notice.

The idea of the writer, in short, is to introduce a few leading species of trees that have proven hardy, reliable and attractive for the past few years, under all the vicissitudes of climate to be found in the Middle States. It is the result of his own personal experience, and may possibly differ from that of other equally as observing growers.

Commencing with the true Spruces, we must give the preference so far to *Abies orientalis*—a species which every lover of the beautiful must admire for its many points of excellence. It grows quite rapidly after once becoming established; forms a perfect, conical outline; is very dense in structure, being supplied with numerous small branchlets; in color, a bright, glossy green; has never been injured in this locality, to my knowledge, within the past twenty years, and the stock of trees now in the country enables our nurserymen to dispose of them at reasonable prices. This valuable species comes to us from the coast of the Black Sea, where it grows to a large size and furnishes an excellent quality of timber. It is closely allied to, and may possibly prove identical, botanically, with, the *A. obovata*, although the two trees can be distinguished, when young, in the nursery rows.

One of the most distinct, and at the same time one of the rarest species in our collections at present, is the *A. polita* of Siebold. In growth it is somewhat in the way of the common Norway spruce, but botanically it is closely related to the *A. morinda*, from which, however, it is readily distinguished. The foliage in our climate changes during summer to a pale, yellowish green, although in Japan, whence it comes, the color is said to be of a pale, glaucous green. It is of moderately-rapid growth, forming a pleasing outline, and so far has stood the test of our trying winters with unvarying success.

The best specimen of this tree to be found in cultivation, outside of its native country, is, perhaps, in the fine collection of Japanese noveltics belonging to the Messrs. Veitch of London, England, the result of one of the expeditions of the lamented collector, John Gould Veitch. Fine young plants, however, may now be seen in several places in this country, and rarely in a few of our more expensive nurseries.

Another attractive species from Japan, and equally as valuable as any heretofore tested, is the very rare *A. alcoquiana*. It forms a tree of the largest size on the Island of Nippon, where it is found, with the foliage deep green above and silvery glaucous below. This is another of the introductions of J. G. Veitch which have proven valuable in this country. After an impartial trial of five or six years, I have no hesitancy in pronouncing it hardy, even in a young state and without protection of any kind. It bears a strong resemblance to our own Western Menzies spruce, not only in the numerous glaucous leaves, but in the shape and character of the cones as well, thus forming another link in the chain that binds together the trees of the old and new worlds.

The other Japanese spruce, known as *A. microsperma*, is, perhaps, untested in this country to any extent. The short time, however, that it has been in the possession of our cultivators, as well as the general appearance of the trees, leads us to believe it will form another hardy conifer for our lawns. It is a medium-sized tree in the way of *A. alcocquiana*, and very beautiful in its growth and outline.

Taking all the recommendable characters of a first-class conifer into consideration, I do not know

of a single one among the newer and uncommon species that is better adapted for general culture in this country than the *Retinispora pisifera*. It may be stretching a point somewhat to term it new, but it is, nevertheless, comparatively scarce in our nurseries, as well as in our private grounds, and certainly deserves great praise for the admirable manner in which it behaves. This very handsome tree strictly belongs to the Cypress (*Cupressus*), but on account of the resinous coating of its seeds has been given to another genus by SIEBOLD. It is a native of the Island of Nippon, in Japan, where it attains to a medium-sized specimen, of slender growth, exceedingly graceful in outline, with dark-green leaves, marked underneath with silvery, glaucous bands. It grows compact and conical in form, and, with generous cultivation, quickly makes a fine specimen. During the years it has been known in this country it has given universal satisfaction in regard to hardiness, and indeed so reliable has it proven that hedges of it are now being tested in various places, which, if successful, will certainly be very attractive at least.

A closely-allied species, *R. obtusa*, is more open in growth, with long, pendulous branches and larger-sized fruit; it also forms a tree of 100 feet in hight on the Island of Nippon, in Japan, where it is so plentiful as to constitute large forests. It is equally as hardy as the preceding, and is destined to become one of our most popular ornamental trees in the Middle States. Its rapid growth, graceful form, beautiful color, entire reliability and excellent timber are all of the highest order. The value of this species for ornamental purposes will in time be duly appreciated, as it seems to combine all the requisites found in our American Arbor Vitæ or Hemlock Spruce.

The Retinisporas are all beautiful, without any exception, and for the most part hardy and reliable, unless in extremely trying winters, but as this article is intended only to call attention to noted species, the many handsome forms grouped under this generic title will have to be passed over in silence.

Another section of the Abies, which has been classed by some botanists as the *Picea* or Silver Firs, contains very many beautiful species. The larger portion of these appear to be well known to our experienced tree-growers at least, but there is a class of planters looming up who wish to know something more about the recent behavior of the most attractive of these, and to such I desire to say, make a note of the *A. Nordmanniana*—a tree that fills the bill in every particular. I am pleased to see that it is becoming quite well known in some sections, and wherever this is the case, it is, as a matter of course, highly appreciated. It improves on acquaintance, as the glowing promise of its youth is more than verified in the tree of more mature growth. From the ground up it is a dense mass of the deepest green verdure, which neither the cold of winter nor yet the heat of summer can impair.

But it will not do to linger long among the Firs, as an extended article might very readily be written on them alone. A few words, however, on some of the rarer species may not prove amiss. The Siberian Silver Fir, or *A. Pichta*, is among our valuable evergreens, although rather slow in growth, and it never grows to a large size. It is, however, of a very dark tint of green, exceedingly compact in form and entirely hardy, three features of the highest importance in a specimen for the finished, well-kept lawn.

As I approach the Conifers of our Pacific Slope, and even of the Rocky Mountain range, I feel a diffidence, amounting in many instances to reluctance, to urge their claims, notwithstanding their beauty is of the highest order of merit. But the term variable applies with so much force to the whole list that to recommend a single species for all localities, even in the Middle States, would be, sooner or later, to have one's knowledge called in question, especially at the close of a severe winter marked by sudden and extreme changes of temperature.

The *A. nobilis*, *A. grandis* and *A. magnifica*, as their specific names denote, are all of the highest character as regards ornamental trees, but not entirely unobjectionable as to reliability. The latter of the trio is from the summits of the Sierra Nevada, in California, and is generally known there as *A. amabilis*, although entirely distinct from that rare and unreliable tree. I may remark here, as I have previously said, that as a rule the trees, shrubs and plants generally of our far Western country are not at all adapted to the East, and, on the other hand, those from Japan, our antipodal representatives, are for the most part of the greatest utility in this climate. There are exceptions, of course, to each, but the rule is a good one.

A. Cephalonica, a native of the Black Mountains of Cephalonia, is mostly satisfactory, notwithstanding that, during very cold weather, the leading shoot is frequently destroyed. When well grown; it is among our most beautiful specimens.

A. firma, from Japan, is succeeding admirably, much to the astonishment of cultivators, who notice the peculiar, spongy character of its young wood, and the seemingly unripe condition of the same at the opening of winter; yet, despite these, it mostly comes through all right, and presents one distinct character, unlike any other species of the genus.

The most pertinent question in respect to the *Pinus*, or Pine family, is not whether the species are hardy, so much as whether they are exempt from disease. Some peculiar form of blight appears on many of the Pines, confining itself, to all outward appearances, to the foliage, which first becomes spotted, then brown, and finally fall from the twigs. Another and more decisive form of blight is that noticed in the Bhotan Pine, or *P. excelsa*, where large branches, and perhaps the main trunk, become diseased and soon present the appearance as if struck by lightning. These causes have prevented many enthusiastic cultivators from devoting much attention to the genus, and especially those from the Pacific Coast.

Among the rarer species, although far from new, might be classed as entirely reliable the Swiss Stone Pine (*P. cembra*). It has its drawbacks, however, although none that should be considered as serious faults. In growth it is very slow, perhaps more so than any other species, but the beauty of its form and color fully compensates for this. Of the richest shade of green, prettily diversified with the silvery glauconsness of the White Pine section, a profuse foliage and numerous short, stout branchlets, it is no mean competitor in the front rank of hardy, valuable conifers.

In introducing the Japan Pines to notice—and yet they should not need an introduction, owing to the years that have elapsed since VEITCH disseminated them—I desire to say that in this country they are comparatively unknown. But these species are succeeding admirably in the few localities where they have been tested, and really lead us to believe that we may depend upon them. However, we have been taught such a bitter lesson by their near relatives, our own Western species, that we cannot recommend them without reserve.

Belonging to the "Strobus," or White Pine group, are the *P. Koraiensis* and *P. parviflora*; to the three-leaved section, *P. Bungeana*: and to the two-leaved, or Austrian pine group, *P. Massoniana* and *P. densiflora*. They all withstand the severities of our winter without protection, at least such has been my experience.

The forms of *Thuja occidentalis* are now almost innumerable and the nurserymen's catalogues are becoming overburdened with names, and yet we have but one rare species to offer to our readers. This, the *T. Standishii*, was introduced under the name of *Thuiopsis*, but its fruit, which appeared a short time since, gave it a true position at once. It has proven quite hardy, and is a very pretty plant. Its rarity with us debars us from speaking as to its appearance as a tree, but the grace and beauty of the young plants are of a high order of merit. It was discovered by FORTUNE, near Yeddo, in Japan.

The *Sciadopitys verticillata*, or, as it is frequently termed, the Umbrella Pine, is a remarkably distinct and unique Conifer. The leaves, which are arranged in whorls at the ends of the shoots, are long and handsome, and, to crown all, it appears to be quite hardy and is readily grown in any good soil. It is of very slow growth and requires some stimulus in the way of old, rotted manure.

But one species of Yew strikes us as coming under the list of rare Evergreens, and that is the *Taxus cuspidata*, notwithstanding there are many rare and showy varieties of the Common English Yew that are well worthy of a place in collections. This attractive plant has behaved so well for several years that too much cannot be said in its favor. When every other Yew died in our arboretums a few winters since, this alone stood the test without the loss of a leaf. It comes from Japan, where it forms a large, deep-green bush, round and dense in structure, with quite distinct leaves.

The Junipers do not at present suggest anything to recommend, and yet their claims should not be neglected. There is a wide field here open to the experiments of the curious in these matters, and I doubt not but the coming generation of planters will find novelties that we have overlooked.

Patient and systematic planting is the only course open to the enthusiastic lover of these trees, taking nothing but practical experience as the means of obtaining knowledge in regard to hardiness and adaptability to the vicissitudes of our variable climate. May the laborers increase and reap the rich reward awaiting them, notwithstanding the many failures that meet them at every step!

SPEAKING of Keir Gardens, the Gardeners' Chronicle mentions a Horsechestnut of no great hight, but remarkable for the spread of its branches, which bend down to the soil, take root and rise again.

The Garden.

WATERING AND MULCHING AFTER TRANSPLANTING.

WE received from a nursery this spring the following Magnolias, viz., *Norberliana*, *tripetala*, *acuminata*, *Halleana*, *Soulangeana*, *conspicua*. They had been growing in pots through the winter; all were in leaf, several in bloom when planted out-of-doors. Not until the drought became severe did any show signs of flagging. Having many plants that needed daily watering, we concluded to water and mulch only those of the Magnolias of which we had no other specimens. The top earth about *Halleana* was first removed so as almost to expose the roots—then water was given as fast as it soaked into the ground until evident that it was saturated to a depth beneath the lowest roots. The earth was then replaced and a light covering of grass spread about the stems, forming a circle three feet in diameter. The injurious effect of the watering was apparent the next day. The leaves, previously drooping a little, now drooped entirely, and the plant died straightway. It was the same with *Soulangeana*. *Conspicua*, treated in the same way, lost its leaves, though it has since formed new ones and is still alive. *Norbertiana*, after the mulching, partially developed a new bud or so, which soon withered, however, and the whole plant, like *Halleana* and *Soulangeana*, died. *Tripetala* and *acuminata* were not watered or mulched. *Cordata* is likewise doing well, though both watered and mulched—but it was crisp and erect before those operations.

It is impossible to say to what extent the previous condition of these Magnolias may have caused the above results. Those in flower would naturally have been the first to suffer, and both *Halleana* and *Norbertiana* were in full bloom. But we are the more ready to believe that watering and mulching wrought harm, since analogous results have occurred to us before, after transplanting Magnolias. Other shrubs, Paul's *Crataegus*, *Prunus triloba* and *Hydrangea quercifolia*, we may also instance as having shown a marked decline after mulching. But in all cases with which we have had to do either in this or in previous seasons when watering and mulching have proved harmful, it must be borne in mind that the subjects had already begun to droop from the effects of heat and dryness.

Our conclusion is not against mulching and watering. We have faith in their efficacy to assist plants which have been set out in the spring through droughts, if applied before they show signs of having suffered and if the watering and mulching be renewed as often thereafter as the continuation of the drought seems to render necessary.

All plants have the power of adapting themselves to certain degrees of unusual dryness or moisture. Thus, in the former, the stomata of the leaves are closed, so as to retard exhalation and enable the individual to retain that which is supplied by the roots. In the latter (moisture), the stomata are wide open, so as to exhale the extra moisture not needed in the processes of the plant's growth. It would seem that the benefits of rain after protracted dryness, arise as much from moistening the air as by furnishing the roots with water. If, during drought, a given plant be watered, it may be supposed that the thirsty roots appropriate as much of it as the leaves and branches need. But the air surrounding the leaves and branches remains as dry as ever. The stomata remain closed, and the parching sun-rays of the ensuing day scald these leaves, as it were, by almost boiling the moisture confined in their cells.

Watering and mulching are helpful only to vigorous plants. To those which are weakened by removal, both should be given before the ground is dry, or the sun hot—indeed before the buds are well opened. If then the season prove wet, the mulch may be removed. But in the sickly plant, they suddenly force an action beyond its powers. It is like taking a sick person from his bed, obliging him to exercise and take food adapted to functions of a system full of vigor. Shade is the first requisite of a plant suffering materially from drought. It should be our first care to *retard* evaporation; to rest the system; to lessen those conditions which exact continuous and lively action until new roots are formed—until one by one new leaves are developed and an equilibrium is restored between the co-operative actions of root and leaf.

Now if we plant out Magnolias in full leaf (the same principle holds good, though less apparent, if the leaves are not developed) they will do well enough, perhaps, so long as the ground is moistened by rains. But as soon as it becomes dry, we have a leaf-surface proportioned to a free action of the roots, and as these are imperfectly established in the new soil, the leaves, deprived of a sufficiency of sap, can no longer sustain themselves and they droop. To give an abundance of water and mulching at this stage, at once aggravates the evil by demanding of the leaves a vigorous action of which they are incapable.

What we have said of the Magnolia may just as well be said of all other trees and shrubs which are sensitive to removal, and more particularly of those which bear large leaves.

We have attempted to show (1) that watering and mulching to be serviceable, should be given before the leaves droop. That (2) it must be continued as long as the drought lasts. That (3) to water and mulch after the leaves droop generally proves fatal. That (4) shade is a first necessity to a drooping plant.

MUSHROOM CULTURE.

EVERY gardener has his own ideas and practice in cultivating mushrooms, but a correspondent of the American Grocer tells his experience, which is interesting as it is somewhat different from the methods laid down in the books.

Early in October I procured a supply of fresh horse-droppings clear of straw. In order to keep the manure from getting wet, I place it under a shed daily as gathered, and turn frequently. During preparation, the temperature should not be allowed to rise over 125 degrees, and may be kept in check by turning and tramping. When the temperature begins to fall, I mix the manure with good fresh loam, in the proportion of one part loam to six parts of manure. This compost I place in my beds, which are about twelve inches deep, and pack it hard with a mallet to within two inches of the top. A thermometer inserted in the material soon marks the temperature as high as 120 degrees, and within ten days it will fall to 80 degrees, when the spawn should be inserted. I am careful to get the best fresh spawn, which I trowel-in, in pieces about the size of a pigeon's egg, eighteen inches apart all over; press them down, and even the surface of the beds. A week afterwards I cover the bed with one and a half inches of turfy loam, taking care, however, to leave a narrow space along the center uncovered with loam, for a few days, to admit of evaporation from the compost. The work is now finished by throwing over the beds a little hay. When it is necessary to moisten the bed, I use water at the temperature of 95 degrees, in order not to chill it. I also sprinkle the floor to maintain a humid atmosphere. In from six to eight weeks the mushrooms begin to show themselves, when I remove the hay. In picking the crop I do not use a knife, but twist the mushroom round, freeing it from the roots: I do not approve of cutting, as the stem that is left in decaying frequently destroys the small mushrooms near it. When the beds get exhausted and the supply fails, I give a liberal application of water heated to 120 degrees, in which I put a little salt. This so stimulates the bed that a second crop of mushrooms, often as good as the first, is the result.

The mushroom is largely used abroad in the manufacture of catsup, &c.; here it is less known. When found growing wild, great care is requisite to distinguish it from other fungi, which it closely resembles, and which are poisonous.

WOOD ASHES FOR THE SQUASH.

EARLY in the spring, the twigs of apple trees too small for kindling wood, together with rubbish of all sorts that had been collected during the winter, were placed in a heap in the vegetable garden and burnt. The ashes were used as manure for various things, while upon the spot where the twigs and rubbish had been burnt a hill of the Butman Squash was planted. Another hill of this squash was planted ten feet from the first and manured with a small quantity of the ashes alone. A third hill was planted ten feet from the second with horse-manure only. July 20, the growth of the first hill (ash-heap) was three times as great as that of the last (horse-manure). The growth of the second hill was twice that of the last. We had hoped to report later as to the fruit. Squash grubs have squashed these hopes.

STANDARD CURRANTS AND GOOSEBERRIES.

LOVERS of the Currant and Gooseberry have reason to feel jolly over the success which seems to attend grafting them upon the Missouri Currant (*Ribes aureum*), which is not liable to the attacks of the borer. Besides, they are exempt from mildew. And thus by a single, happy hit the two great drawbacks to currant and gooseberry cultivation have been overcome. The beauty of these little trees when loaded with their pretty berries, as displayed at the Centennial, is of itself enough to insure their general cultivation. It would be well for those who intend experimenting with grafting currants to bear in mind that there is a great difference in the varieties of the Missouri Currant, some making better stocks than others.

Dairy Husbandry.

ENGLISH AND AMERICAN CHEESE DAIRYING.

Reference has heretofore been made in these columns to the growing diversion of the milk product of Great Britain toward direct consumption, rather than to the manufacture of butter and cheese. It is stated on good authority that since the plan of conveying fresh milk to towns and cities by railway, and especially since there has been more knowledge disseminated in regard to the preservation of milk during its transit and delivery to consumers, there has been a large increase in the trade, and the result is that the cheese and butter dairies of the country have been encroached upon to meet the increased demands of fresh milk consumption. Again, the increase of population in Great Britain is another element that has drawn largely, and must continue to do so, upon the milk supply of the country.

The furnishing of fresh milk for city consumption is more profitable to dairy farmers than to manufacture it into butter and cheese. The transition, then, from the latter to the former is more easily brought about so far as the dairyman is concerned, since he will naturally seek those channels for his product which yield the most profit. The question which is now agitating the dairy industry of England is a better method of preserving milk and in regulating the milk trade, from time to time, so that there shall be little or no surplus milk on the market; and to avoid losses on this account factories at the railway depots where farmers deliver their milk are suggested. On this plan the quantity of milk needed from day to day in the different milk walks of the city is telegraphed to the respective factories furnishing said walks, and this prevents the transit of surplus milk, leaving it to be converted into butter and cheese at the factory. By the free establishment of such factories at convenient points along the railways, it is believed the consumption of milk in cities and large towns will be promoted, because a regular and unlimited supply can then be had. Anything likely to affect the quantity of butter and cheese made in Britain must be of interest to American dairymen, because her main dependence for cheese is upon America.

We have before us an abstract of the official returns showing the number of cows and heifers in milk in Great Britain for the years 1874 and 1875, respectively. From these returns it appears that there has been a decrease of milch stock in the kingdom from 1874 to 1875 of fifty thousand cows. The number of cows and heifers in milk in Great Britain in 1874 was 2,273,797. In 1875 there were only 2,223,241. Of this number England had in 1875 but 1,595,296; Scotland, 396,833; Wales, 261,082.

We have no statistics at hand showing the percentage of the milk product used directly as food in Great Britain. In 1870 it was estimated that 41 per cent. of the entire milk crop of the United States was used directly as food. The number of milch cows then in the United States was about 11,000,000, or nearly five times the number at present in Great Britain. In 1870 the population in England and Scotland was upward of 25,300,000 souls, and to-day it is 32,000,000 in the United Kingdom. It is evident, therefore, if milk was used as freely in Britain as it is in the United States, a very large share of the milk product would be consumed as food. Hence we are inclined to the opinion that the views expressed by persons in England who are familiar with the milk trade, that cheese dairying must gradually decrease in that country, is not without foundation; and this must be more apparent when we consider the low price at which American cheese has been placed before the British consumer. The English dairyman finds cheese-making by far the least remunerative of any branch of the dairy. Indeed, it is only by making the *high-priced* cheese that he is able to get anything like fair returns for his capital and labor. A correspondent from one of the best dairy districts of England, in a letter under date of Aug. 8, says:

"Cheese is much lower than last year—say 3 cents per pound. Low qualities are scarcely salable at any price. Farm dairy cheese is averaging about 50 shillings per cwt., while some of it is as low as 30s. English factory cheese is fetching 60 to 72 shillings per cwt. American cheese of fine quality can be bought at 45 shillings, and the finest at 47 shillings, in this county. Beef and mutton are the only agricultural products that keep up in price. They are from 8 to 11 pence per pound (16 to 22 cents). Wool is very low—say 35 shillings for mixed lots. I know a farmer who has several years' wool on hand, for one of which he once had 62 shillings offered."

He remarks further:

"English farmers are becoming desperate. On one nobleman's estate they are giving up the farms wholesale and are emigrating, because the landlord would not reduce the rent. If things go on this way much longer, the price of land will be seriously affected. I am afraid we are helplessly drifting into one of the most serious crises English agriculture has known for a long time. What the end will be no man can tell, and it is painful to speculate on it. At present there is no silver lining to the cloud discernible."

This state of things, it seems to us, must have an important bearing on the cheese trade of America. The gradual abandonment of cheese dairying; the high price of meats, which must have a tendency to promote a larger consumption of cheese, the cheaper animal food, cheese, being used instead of meat by the working classes—all these must indicate a larger demand from Britain for American cheese, while at the same time they promise a permanent trade in dairy produce for us, thus giving a sure outlet for all surplus likely to be made in this country for years to come. American dairymen have had serious fears in regard to the over-production of cheese; but we have always found a market in England for our surplus, and generally at very steady prices.

Some anxiety has been expressed by American dairymen in regard to the future of our cheese industry, and especially has this been the case during the present year, when cheese has ruled at comparatively low prices. We have deemed it, therefore, of some importance to place before our dairymen the foregoing facts and arguments, believing, as we do, that there is no branch of farming that promises more permanence and that is liable to less fluctuation in prices than the dairy and its products. We have referred only to the foreign demand, but much can be said in favor of our position when the needs of our home consumption are taken into account. As our population increases, larger and larger drafts are made from year to year for fresh milk for city and village consumption, while the demand for butter is so enormous that it keeps the rapid increase of cheese dairying within due bounds. Of course it must not be expected that the high rates of a number of years past can be had, but we may confidently look to no lower prices than those which ruled before the war, and our dairy industry was then quite as prosperous as any branch of farming.

THE GREAT DAIRY SHOW AT FROME, ENGLAND.

There is to be a grand Exhibition of Cheese and Butter at Frome, in Somersetshire, Eng., on Sept. 27. The Show will be held under the auspices of the Frome District Agricultural Society. The Dairy Shows in Somersetshire have attained a wide reputation in Great Britain as among the best in the kingdom. Somersetshire is the county where the famous cheddar cheese originated, and which for years past has furnished the English markets with some of the highest priced cheese of English make. To take a prize at the Frome Show is deemed a great honor by dairymen and cheese-makers, and a prize means something beyond the gold that is awarded, because the Judges who make the awards are chosen from among the most noted experts in England. Their decision, therefore, carries weight with it, and to receive a prize at Frome carries a reputation to the dairy in all the markets of England. They do things differently in the mother country from what is often the practice here in our agricultural Shows. In England the Judges are selected in reference to their thorough knowledge and ability to judge of the merits of articles coming under their notice, and they command the confidence of the agricultural community. In this country a knowledge of the matter to be adjudicated is often considered of little moment, and the spectacle at our great Centennial Exhibition in regard to this matter, in some of the departments, must be a surprise to foreign exhibitors and should be a humiliation to us. The Country Gentleman, in criticising one of the departments at our Centennial Exhibition, very aptly remarks as follows:

"Ornamental Judges at $1,000 each, with three experts for work, constitute an arrangement so peculiar to the present emergency as to be worthy of record, to say the least." Again, to the opinion expressed by a friend that "instead of scolding the management," we should rather "scold those whose apathy from the first has been in such marked contrast with the earnestness shown in other departments," the Country Gentleman says:—"We venture the possible hypothesis that the case might have been different if the management had been such as to command the confidence of the agricultural community. 'As ye sow, so shall ye also reap,' is a maxim borrowed from farming by high authority and continually verified in practice."

This, in our view, touches the head of the matter, and is a subject which the managers of other Shows than the Centennial can well consider with advantage, because the awards as now given often mean nothing, except it be a clever decoit to mislead, which is quite well understood by some of the parties interested, to say the least.

The money prizes offered at the Frome Show amount to nearly £200 sterling, or $1,000 in gold, exclusive of the sweepstakes, open to all the world, in which the exhibition of the best four cheeses of any make or size takes two-thirds and the second one-third of the sweepstakes, the Society giving half the amount of the second prize to the third best. If some of our American factories could make an exhibit at Frome and be so fortunate as to take a prize, it would be a great triumph for American dairying and of very great advantage to the factory, giving it a reputation which would be worth in the future something more substantial than the mere premium awarded.

THE DROUGHT AND THE FALL MAKE OF CHEESE.

It is a long time since the dairy industry of New York has suffered so severely from drought as during the present year. Pasturage is scanty in all directions. The meadows afford little or no after-feed, and to add further to the trouble, water on many farms has failed, or is in such small quantities that stock does not get a full supply. In many instances cows are driven long distances to water, or teams are employed to haul water for the herds. Many farmers who have neglected to provide sowed corn or some other forage crop have been obliged to feed hay and grain to keep their animals from starving. Under this condition of things, it must be evident that the milk product is much below the average of other seasons, and it is estimated by good judges that the cheese crop of the State will fall below the average of other years from a quarter to a third of the entire quantity produced.

Our advices from England are that drought has been prevailing there and is more severe than has occurred at any time during the last twenty years, and of course the average yield of milk must be less than in other years. In view of these conditions, it is confidently believed by those most competent to judge that the price of dairy products must advance on the full make both of butter and cheese. With the shipment of cheese up to Aug. 30, the hot weather or "off-flavored" stuff will be mostly disposed of and factories will be in condition to hold their goods during the cooler weather without detriment. Our September and early October cheese has been always of finer quality than that made earlier in the season, and it is always sought after by shippers and merchants when making up their winter stocks. Hence there is every reason to believe that higher rates must be paid than for the summer cheese, or the factories will refuse to ship freely, at least of their finest goods.

The excessively hot weather has very clearly shown the necessity of better curing rooms—rooms so constructed that the temperature can be controlled and not allowed to go above 70° Fahrenheit. There has been a large amount of over-heated cheese which, on account of its defective flavor, could not be sold at full prices. The most of this cheese has now gone forward, and the make from this time out, or until the November frosts send the herds into winter quarters, will be of fine quality, and must be sharply sought after both at home and abroad. The tendency, then, of the market is upward for all first-class cheese, though we can hardly expect the advance will reach the prices of last year.

Farm Economy.

ANOTHER NEW FORAGE PLANT.

It is hoped that among all the new forage plants talked about of late, that some of them will prove of value. Here is one which is said to be taking precedence of all others in Northern Georgia, at least so says the Eufaula News.

During the session of the Agricultural Convention at Gainesville, we made the pleasant acquaintance of Mr. S. W. Brooks, a delegate from Brooks county. He carried to the Convention samples of a forage plant which is now extensively cultivated in Brooks and some of the adjoining counties of Georgia and Florida, and which is now in great esteem there for its valuable properties. He calls it "Indian Clover," or "Beggar Weed." It bears a resemblance to the plant which we call "Beggar's Lice," and produces an adhesive seed very similar to that weed. But as it is cut for forage when in bloom and before the seed hardens there is no trouble on this score. The seed is sown in drills, about as thick as cotton seed, though the drills are only two feet apart. The plant grows to the hight of four and even five or six feet, and has a bushy top full of leaves very much resembling the foliage of the field pea. They are evidently fully as palatable and nutritious as the pea leaves, and do not fall off like the latter. To the human taste, the dried leaf is sweet, agreeable and succulent, and its fragrance is as pleasant as that of clover. Mr. Brooks says that when this provender is put in a trough with other kinds, the mules will push the oats and fodder out of the way to get at the "Beggar Weed." For milch cows it is especially valuable, being rich and juicy and eagerly devoured by them.

The yield of this plant is very great. It may be cut three times in a season, growing up repeatedly from the old stumps, and yields many hundreds of pounds to the acre. The samples which Mr. Brooks carried to Gainsville were of the second cutting of this year, and he will certainly get one and perhaps two more cuttings. It is not a perennial, but the seed must be planted each year. It produces well on poor lands, but of course does better on rich soils. Horses, mules and cattle will eat it up clean, stalks and all, and thrive on it.

We have in our office a bunch of this forage, obtained from Mr. Brooks, and invite our farming and other friends to call and examine it. If its appearance, taste and smell do not all please them, we shall be greatly mistaken. Mr. Brooks authorizes us to say that he can furnish small quantities of the seed to persons desiring and ordering it—not exceeding enough to plant one acre to each applicant. As he will have to employ hands to gather the seed, he must charge for them. His post-office is Quitman, Brooks county. We believe he is a merchant of Quitman.

COMMON-SENSE AND SCIENCE.

A sailor, remarks Archbishop Whately, will, perhaps despise the pretensions of medical men, and prefer treating a disease by Common-Sense; but he would ridicule the proposal of navigating a ship by Common-Sense, without regard to the maxims of nautical art. A physician, again, will perhaps contemn Systems of Political Economy, of Logic, or Metaphysics, and insist on the superior wisdom of trusting to Common-Sense in such matters; but he would never approve of trusting to Common-Sense in the treatment of diseases. Neither, again, would the architect recommend a reliance on Common-Sense alone, in building, nor the Musician, in music, to the neglect of those systems of rules, which, in their respective arts, have been deduced from scientific reasoning aided by experience. And the induction might be extended to every department of practice. Since, therefore, each gives the preference to unassisted Common-Sense only in those cases where he himself has nothing else to trust to, and invariably resorts to the rules of art, wherever he possesses the knowledge of them, it is plain that mankind universally bear their testimony, though unconsciously and often unwillingly, to the preferableness of systematic knowledge to conjectural judgments.

There is no class of individuals that display more respect for science in every species of industry except their own than farmers—and no others seem to disdain the application of science to farming as much.

When they can be induced to believe that the principles of science are just as applicable to farming as they are to medicine, to Architecture, to Astronomy or Chemistry—then Agriculture may throw up its hat in joy!

PASTURING MEADOWS.

I have several times seen it stated in agricultural papers, (and I think in yours) that meadows should not be pastured. My experience teaches me directly to the contrary.

On my farm I have a meadow in which there are some trees that I value, and therefore do not pasture it. On the opposite side of the fence are two other meadows of precisely the same character of soil, into which I turn my cows, oxen and horses as soon as the hay is taken off, where they remain until taken up for the winter.

On these two meadows I invariably cut a larger and better crop of hay than in the one not pastured. All the meadows having had the same cultivation and the same manure when cultivated. The trees in the first named meadow are too few to have any noticeable influence on the crop. You say "Tell us your experience." Here you have mine. Yours truly, R.

Montana, or Nevada Rye.—In a late issue you ask any one who has had experience with Montana Rye to make it known. I invested one dollar in this wonderful grain that was said to produce (I think) a hundred or more bushels to the acre and weigh much heavier than wheat. The grains were very large and I thought I had made a most desirable acquisition, but, alas for human hopes! I was doomed to a sad disappointment. How the seed was produced is a mystery to me. I did not succeed in getting one grain. To sum up, this much-vaunted Montana Rye proved, in my experience, to be even a greater humbug than the famous Egyptian Corn.—C. A. Havenstrite, *Luzerne Co., Pa.*

The Centennial.

CENTENNIAL CORRESPONDENCE.

WESTMINSTER HOTEL, Philadelphia, Sept. 7.

WHEN in the year 1869 I first saw American horses, they struck me as being coarse and weedy, since then, from the frequent and continued importation of clean-bred foreign stock, a great improvement has been effected, still there is a vast field open for further enterprise, which, if only properly directed, cannot fail to be of both national and individual profit. The American horse-breeder, in the aggregate, is wonderfully prone to commit grievous errors in crossing.

After one hundred years of existence there is not, as yet, such an animal as a pure-bred American horse. The American race-horse is the Anglo-Arabian—neither more nor less. The American trotter is rapidly progressing to be a clean-bred horse; but his nobility of blood comes from the Anglo-Arabian. The American cart horse is a mongrel for excellence; he is a horse, but of what family, race or geneology, no one cares to keep a record. To keep breeds pure should be the aim of every breeder. Half-bred animals, as individuals, are frequently of high value; but half-bred or cross-bred stallions are a drawback to the race. They cannot be depended upon to reproduce their own good qualities. It is otherwise with mares, half-bred and cross-bred dams being frequently of great value and producing animals of rare excellence when the sire has been a clean-bred horse. Colts bred at hap-hazard are a bad investment of time and money, as numbers of the horses on exhibition here to-day testify in inferiority of action and appearance.

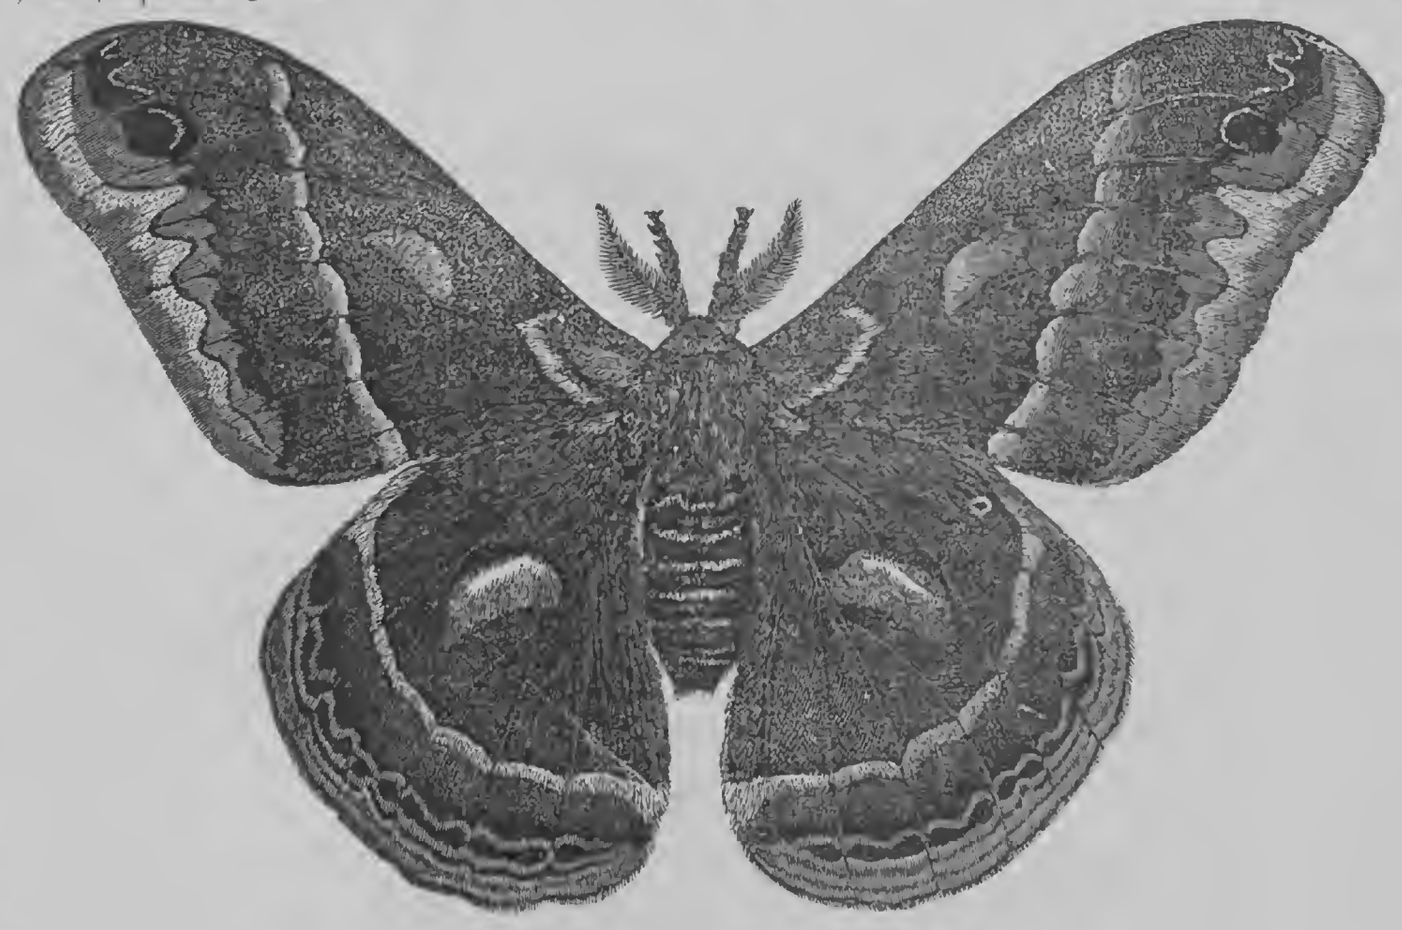
The official catalogue gives the entries as 220 in number, all of which are exhibited by American or Canadian owners. First on the published list is the name of Princely Leamington, now twenty-three years old and the sire of almost countless winners. It is truly patriotic of his owner, Aristides Welch, Esq., of Chestnut Hill, to exhibit him, as the reputation of the horse could not be improved by any reward given by any Judge. The sire of Longfellow and of Miss Alice, of Lyttleton and Lynchburg, can well afford to rest on his fame.

To attempt to describe this noble animal would simply be to portray just what a race-horse should be. Leamington is a well-put-together machine, endowed with great beauty, rare intelligence and unflinching courage, and the worthy progenitor of a worthy race. His son, Lyttleton, stands near him, as game a little horse as ever looked through a bridle. Mr. Welch also exhibits Lida, the dam of Conqueror; Maiden, the dam of Parolo, and Maggie B. B. These three mares have foals at foot by Leamington. The entire lot speak well for the stable economy of Chestnut Hill farm.

Col. Jenifer, of Virginia, exhibits The Jenifer Arabian, a lovely type of the desert horse. He is gray, almost white, with a head and neck fit for model—a straight, short back, and clean sinewy legs, like steel. This horse is from the Sahara, and has all of the elasticity of action peculiar to his race. There is no fear that he will ever need any of those hideous trappings worn by low-bred horses to shield them from the ill effects of natural malformation. Col. Jenifer is most sanguine in his hopes of the success of the dessert blood as a cross. He looks back to the days of the Godolphin Barb or Arab, as he may have been of his cotemporary, the Dorley Arabian, and more recently to the success as sires of the Byerly Turk and of other eastern horses imported into the British Isles. It is not too much to say that the descendants of these same animals are the most magnificent horses in the world and will, probably, never be surpassed. There are already three foals of the Tenifer Arabian on exhibition, one of them is out of the clean-bred, imported Percheron mare Rosa Bonheur. His is of great promise.

Among other thorough-breds is Terror, an animal whose good qualities are dual. He is pretty and fast. Sharpcatcher, an Anglo-Arabian, bred in Canada, is a useful stallion to get carriage or saddle horses. Close to his box is that of Queen of the Dominion, a bay mare, neat and compact and full of fire. Young Peacock, a Cleveland bay and a beauty, is certain to get stylish carriage horses, if bred to mares of his own family; but I have small need of approval for half-bred Cleveland bays. Another stallion, a dapple brown, miscalled a Cleveland bay, is a handsome animal, with more of the cut of a charger or hunter about him than of a carriage horse. He is named Emperor, and is said to have been bred, or, at least, owned by the Emperor Napoleon III.

The matched pairs of carriage horses shown are of moderate excellence: as on the specimens of the American trotter, none of the cracks of the trotting turf having been sent out to grace the Centennial show. The French horses are all exhibited by American owners, and do not, as a class, speak much for the good judgment of the men who selected them. The mare, Rosa Bonheur is far away—the best of the lot. There is one thing I cannot understand, it is why any

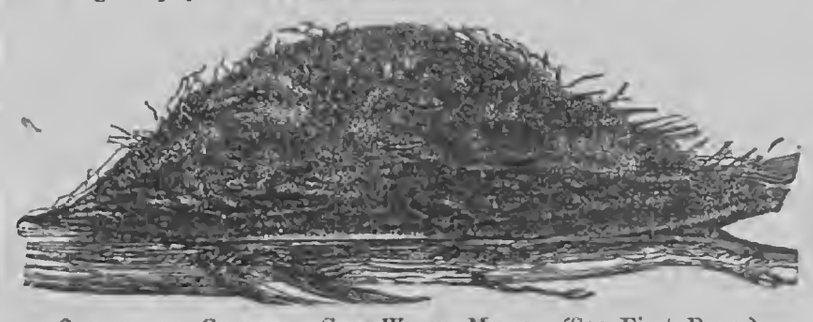


CECROPIA SILK-WORM MOTH.—(See First Page.)

man in his senses should cross the Atlantic to bring back a brute of a Norman or Percheron cart horse, famous for flat feet, hog eyes, clumsy shoulders, coarse manes and heavy tails, when he could go to the vale of Clyde and there buy a handsome dapple brown with small, short ears, large clear eyes, flat short legs, a strong back and clean-cut hock, and a temper and courage equal to pulling anything in the collar. Even an Eastern country draft horse is superior to a French horse. The cost would be about the same and the risk and trouble less. The cross-bred heavy draft horses possess among them many individual good qualities, but I was grieved to find several stallions among them. It is this aimless crossing and re-crossing that hinders the improvement of the horse—nay, it does even worse: it produces mongrels, nondescript things, valueless except as mere drudges. As good a horse as I have seen is one possessed by Lord Logan. He was begotten by a Clydesdale sire out of a highly-bred English mare. She had been a charger in the British cavalry service, and must, from the appearance of her son, have been a good one, as well as a beauty. The Judges have not given their decisions as yet. Their decrees will not be known before next week.

If there is much to criticise in this Centennial Horse Show, there also is much to hope from it, though it is cause for regret that foreign breeders did not exhibit. The Norfolk trotter could have made a brave show, so in another wise could the Orloff trotter, and British saddle horses with imported riders could have been rendered objects of education, as well as of interest. The youth of America are slow to get into the saddle, and a fair example of good horsemanship would be a proper incentive in the right direction.

The show of dogs is large; it numbers 557 head, and is, with a very few exceptions, a discredit to the country at large. The fox hounds on exhibition are sad, deplorable-looking brutes, whereas a well-bred English or Irish fox hound is an animal of great physical beauty and power. With



COCOON OF CECROPIA SILK-WORM MOTH.—(See First Page.)

head erect and sniffing the breezes of his native island home, with a stiff country and game fox before him, woe to men and horses if they would follow and are not good and true—the riders pledged to their snaffles to never alight, the horses able for flood and field. The show of spaniels is very large and contains in its ranks one good brace of red, Irish setters. Among the retrievers the best is a curly, red, Irish water spaniel. Some of the Scotch terriers are perfect beauties, but then they are all imported, except the pups of one little lady, which were dropped here a few hours after her arrival. In greyhounds I only saw one worthy of notice. He is a promising pup, ten months old, of the admired blue color, and with a head and neck beautiful as a girl's. America exhibits one charming canine, a Chesapeake Bay ducker. He looks to be water and weather proof, and is both intelligent and comely. There are three English bulldogs here which, in charm of countenance, are only to be compared to the famous dog of Bill Sykes. They are fresh from home, are undershot, and though friendly in demeanor, have a lurking devil in them ready to spring upon an open or concealed foe. No farmer should be without one of these clean-bred bulldogs, for as a protection, being faithful, they are better than a squad of police or a brace of six-barreled revolvers. The shepherd dogs known as collies are a most interesting and intelligent family, not only the clean-bred, but the half-bred between the Scotch Colly and the Esquimaux, and there are some good ones here, the best of which, however, is a brace of puppies. One superb Newfoundland dog attracted my admiration. He was accompanied by his son, out of a Mt. St. Bernard dam. The son is not as handsome, nor does he give promise of being as powerful, as the sire. Here again, as in horseflesh, American taste runs riot. Dogs are dogs; pedigree is nothing. One pointer pleased me not a little. He was strong and active, also handsome. There was not one truly handsome specimen of the Garden setter, and yet these black-and-tan dogs are stanch before the gun and work well in heavy land. They are stronger and more lasting than the English variety, and in power of scent and endurance are hardly second to their Hibernian cousins. Some of the toy terriers were very pretty and obtained a liberal share of admiration from visitors. One tiny Skye was as charming as a Skye could be, and that is a vast amount of praise. The pugs, though pretty, jolly-looking little fellows, were not high-bred of their class.

So much for the Horse and Dog Show of this Centennial year. M. M.

PHILADELPHIA, Sept. 8, 1876.

Now is the time to go to the Fair, and the traveling community are fully alive to the fact. The trains come into the depot with the frequency of street cars, and the crowds that flock into the grounds remind one of a visitation of grasshoppers. This is delightful from the tradesman's and tavern-keeper's point of view. The prospect of gathering shekels is once more bright, and the india-rubber capacity of the "mammouth" hotels is being severely tested. The fire that has swept the entire row of edifices facing the main building leaves a hiatus that is more pleasing to the surviving landlord than words can express. I regret to say that in almost every instance the Ishmaels who control the boarding-houses have raised their prices with their prospects, and all the high, moral talk about the innocent stranger being cared for as cheaply and as well as if under his own vine and fig tree is pure delusion.

The cheapening of the price of admission one day in the week (Saturday) has had a stimulating effect on the local attendance. Philadelphia and its environs turn out "by a large majority" on these occasions and, much to the disgust of the refreshment purveyors, take the precaution to fetch along, in baskets, a bountiful lunch. One of the most amusing sights is to stroll about the grounds and see these *al fresco* parties arguing with sandwich and beer, and totally oblivious of everything but their own present enjoyment.

On the border of the lake lies a model in bronze of the hand that is to adorn the statue of Liberty to be erected in New York harbor. Some idea of its size may be derived from the fact that I saw two of these cheap parties taking their luncheon inside the wrist and fingers of this stupendous hand. When the statue is in place, it will be no longer necessary for sea captains, when in want of a forcible anathema, to confine themselves to the beard of old Neptune, as they can with equal telling effect swear by the hand of the Statue of Liberty.

The trial of the steam fire-engines during the week has attracted a great many who are interested in the subject, as well as hosts of idlers. Some fire companies came from the interior to see how the machines worked.

There was a quantity of water wasted and a large amount of coal, smoke and nastiness scattered about. The trial concluded, the owners of the engines are watching each other with sly, mysterious airs and waiting nervously for the Jurors' report.

Now that the reports have all been sent in and it is daily expected that the Commission will publish the awards, there is intense excitement among exhibitors. In some groups feeling runs very high, and the most serious charges are bandied about implicating Jury, Commission, exhibitors, correspondents, and any one who can possibly come within the circle of the influence of the opposing interests. There will be some exciting reading in newspapers as soon as these little differences are adjusted in public.

Foreigners, as a rule, do not take kindly to the country, and not a few amusing jokes have been circulated at their expense. It is said that one of our British cousins finds the trunk check system very hazardous because, as he said:

"When you deliver your luggage, y' know, you get a bit of brass; but if you lose the bit of brass, you lose yer luggage, y' know. Blarsted country!"

Affairs in Agricultural Hall are very quiet at present, the main attraction being the stock yards, which you have a special correspondent reporting, and I will not encroach on space.

YOUNG RURAL.

CENTURY BLOSSOMS.

THE Jaquard Loom in Machinery Hall is a wonderful piece of mechanism.

FOREIGNERS marvel at our ice-boats, and it is said that Russians think of trying our models.

IN the carriage annex is a narrow gauge railroad car made for Dom Pedro. Its fittings are luxurious.

THE Main Building, after the close of the Exposition, it is reported, will be moved to Chicago, to be used there as a grand union railroad depot.

THE life-raft afloat on the lake looks like two enormous sausages tied together. It is very buoyant, and is a useful apparatus for saving life.

THE north third of the Main Building is occupied mainly by domestic paper and muslin exhibits. It will be a saving of time to skip that part of the Fair.

A PATENT rowing contrivance consists in having the oars so cut and braced that the rower can sit with his face in the direction the boat moves, while the oars make the usual stroke. It is a capital thing for duck hunting.

THE woods of Japan, of which there appeared to be about a hundred sorts, are conveniently and tastefully arranged, each specimen being a short plank, a portion showing the natural texture, and another part varnished, with a shorter slab attached with the bark, and a dried and pressed specimen of the leaves and growth added.

Two car-loads of fruit from the State Grange of California have arrived at the Exhibition and are now being unpacked in the Pomological Building, east of Agricultural Hall. A quantity of fruit from Nebraska has also just arrived. The consignments include apples, pears, peaches, quinces, apricots, gauges, plums, nectarines and grapes They are in excellent condition, and will form a feature in the display opening this week, which will be the finest ever made in the United States.

EVERY one should see the necklace purchased

by the Emperor of Brazil in the Italian Department, Main Building, if only to judge of Imperial Brazillian taste. Americans think it is ugly. One does the correct thing, if one goes to the Vienna bakery, drink the coffee, eat the bread, roll your eyes, and declare it is the loveliest nectar you ever tasted. The display in the photographic annex proves that the Polish women are about the handsomest in the world. They are pretty, and no mistake. Don't think a brick tile is terra cotta, because it is yellow.

Horticultural.

BLEEDING OF GRAPE-VINES.

A FEW of our vineyardists have labored assiduously to prove that what is termed "bleeding" of grape-vines was in no way injurious, just as the doctors, a few years since, assured their patients that drawing blood from the veins of a human being was an almost infallible panacea for all kinds of diseases. Happily, however, for the human race, the latter barbarous practice has almost ceased, and it is to be hoped that all good gardeners will endeavor to prune their grape-vines at a season when the sap is not likely to flow from the wounds made.

Any vineyardist who will experiment for the purpose of ascertaining the results of a loss of sap through untimely pruning, may soon be convinced that it does so, even if no serious ill-effects are observed.

Wm. P. BROOKS of the Massachusetts Agricultural College, has been experimenting for the purpose of ascertaining the effects of bleeding upon grape-vines and communicates the results to the Scientific Farmer as follows:

The question, whether bleeding injures the grape-vine, has of late attracted the attention of many; some, on account of the extreme tenuity of the sap, being led to conclude that its passage through the vine was perhaps only a mechanical process, or, at least, that it was of little consequence to the plant, being mostly water. I shall not attempt to answer this question authoritively, for this can be done only by one who has carefully and repeatedly made the experiment; but will simply give a short account of a few investigations as to the composition of the sap of the vine, which I have recently made at the suggestion and under the direction of Prof. Goessmann, drawing a few conclusions from the results obtained.

The sap tested was collected on warm days in May, before the foliage expanded, by cutting off the end of a vigorous shoot, and carefully catching what dripped from the vine in bottles. The first test made was with an ordinary hydrometer for the specific gravity; but though this was doubtless a little greater than that of water, I was unable to obtain a result which I could express in figures, with the instrument used. Evaporation to dryness, and heating the residue at from 100 to 110 degrees Centigrade, showed 125.6 mille-grammes of solid matter in 100 cubic centimeters of sap. This proves that, although almost imperceptible with the hydrometer, the sap does contain a considerable amount of something in solution, and when it is considered how weak solutions of plant food must be, that they may be taken into the tissue of the plant without injury to it, it will at once be seen that, if the solid matter contained in the sap is composed of elements which can nourish the plant, it is, as may be said, its very life blood.

A pressure of other work prevented me from determining quantitatively what this solid matter was composed of; but I proved, beyond a doubt, the presence of phosphoric acid, lime, magnesia, potash and nitrogen. Each of these principle elements of plant food then being present, and apparently in large quantities, it certainly cannot but be injurious to allow the sap containing them to run from the vine.

The injury, of course, must be in proportion to the amount of sap, and thus of plant food lost, and a certain amount lost from vines growing on a poor soil, must show injurious effects more plainly than the same amount lost from vines growing on a rich one; for the possibility of repairing the loss in the former case is not so great as in the latter. Thus the injury in any case is a matter of degree; the loss of a small amount of sap producing no more injurious effect on the vine than the loss of a small amount of blood from a slight cut on the human body; but the loss of as much sap as will run from a vine pruned in late spring, would undoubtedly be injurious in a high degree.

The safer way is to prune either in autumn, or so early in the spring that the end of the branches may dry, and close over the pores before the sap starts. It takes no longer to prune at the proper time, and it is a period of as much leisure as any.

PERSIMMONS WANTED.

BELIEVING that among our many wild varieties of persimmons there are some worthy of cultivation, we would be pleased to receive specimens, or at least descriptions, of any really promising and distinct sorts which the readers of the RURAL may happen to know. The persimmon belongs to a very reputable family of fruits and a little search may bring to light something quite valuable in the way of varieties.

LIMONIA TRIFOLIATA AS A STOCK FOR THE ORANGE.

S. B. PARSONS, Esq., writing to the Sub-Tropical about orange stocks, says:—It is asserted by some and doubted by others that this plant sometimes called *Citrus trifoliata*, is hardy in Siberia. I have been among the doubters, but last week saw in the open ground in New York Central Park, a flourishing plant which had stood unprotected two winters, one of which was exceedingly severe.

I know by my own experience, after trying faithfully both lemon and orange stocks, that the *Limonia trifoliata* is the only one on which the little Rumquat orange will grow. I have no doubt that all the citrus family will grow upon it, and intend to test it thoroughly with some 165 varieties which I have. If successful, the hardiness of this stock will be of great value, as we shall then have our groves upon roots which are absolutely safe against frost even as severe as that of 1835.

It may possibly dwarf the orange so that we can plant four times as many on an acre and pick the fruit from the ground. However this may be, we have in its hardiness an absolute quality, the value of which cannot be overrated.

FITTONIA ARGYRONEURA.—(See Page 186.)

Scientific and Useful.

TOMATO LEAVES—SINGULAR PROPERTY.

I PLANTED a peach orchard, writes M. Siroy, of the Society of Horticulture, Valparaiso, and the trees grew well and strongly. They had but just commenced to bud when they were invaded by the curculio (*pulgon*), which insects were followed, as frequently happens, by ants. Having cut some tomatoes, the idea occurred to me that, by placing some of the leaves around the trunks and branches of the peach trees, I might preserve them from the rays of the sun, which were very powerful. My surprise was great, upon the following day, to find the trees entirely free from their enemies, not one remaining, except here and there where a curled leaf prevented the tomato from exercising its influence. These leaves I carefully unrolled, placing upon them fresh ones from the tomato vine, with the result of banishing the last insect and enabling the trees to grow with luxuriance. Wishing to carry still further my experiment, I steeped in water some fresh leaves of the tomato, and sprinkled with this infusion other plants, roses and oranges. In two days these were also free from the innumerable insects which covered them, and I felt sure that had I used the same means with my melon patch I should have met with the same result. I therefore deem it a duty I owe to the Society of Horticulture to make known this singular and useful property of the tomato leaves, which I discovered by the merest accident.

CACTUS PAPER.

As the supply of paper making materials give out in one place another source is found, but who would have supposed that the miserable cacti of the Western plains would have ever been turned to any good use. But here is what Dr. BOBB writes to the Presbyter about this plant in connection with paper making:

"In California there are mountains covered with cactus—thousands of acres that even the gnats avoid, so dense are these vegetable porcupines. The cactus deserts have been regarded as worthless. But we are learning not to judge hastily that anything is worthless that God has made. Capt. Walker of Soleday, has just started a ninety horse-power engine, crushing cactus into pulp for making paper. He sends twenty tons of this prepared fiber every week to Geo. W. Childs of Philadelphia, the publisher of the Daily Ledger in that city. Mr. Childs has a paper mill of his own, and will use the cactus pulp from the deserts of the Pacific slope instead of straw. Hitherto, California has imported nearly all of its paper from the East. But this discovery will lead to the erection of paper mills here, and the production of paper so cheaply that it will bear shipment to the Atlantic coast. The supply of cactus in our mountains is almost unlimited, and probably its use may even reduce the price of paper in the markets of the world.

"Such facts are interesting in themselves. The idea that the wild, almost untrodden slopes of the Pacific are to furnish the material on which books and newspapers are to be printed—that intelligence, genius and learning are to depend for their diffusion upon the desert thistles which are regarded as a pest, is startling. But it suggests the question—What next?"

NEW FIREPROOF BUILDING MATERIAL.

THE question of a fireproof building material seems as if it were about to be solved, if statements made at meetings of the Institute of British Architects may be accepted as evidence. The material is concrete. An instance was mentioned of a building which had been completely gutted by fire; but the walls, constructed of Portland cement concrete, with ironwork imbedded therein, "withstood the fire perfectly, and were the only parts that did withstand it." It has been proved by conflagration and by experiment that iron doors will not resist intense fire. They warp and eventually crumble away, while concrete doors remain unaffected. It would now be possible to construct a warehouse or any other building entirely of concrete, for stairs, window-frames, door-frames, and indeed nearly every part may be finished without the use of wood. In St. Paul's Cathedral that portion of the dome open to the public is shut off from the other part by fireproof doors of concrete.

The Naturalist.

ABOUT BIRDS.

EARNEST INGERSOLL gives in Scribner's Monthly the following interesting item of information about the structure of birds:

The most prominent fact about a bird is a faculty in which it differs from every other creature except the bat and insects—its power of flying. For this purpose the bird's arm ends in only one long, slender finger, instead of a full hand. To this are attached the quills and small feathers (coverts) on the upper side, which make up the wing. Observe how light all this is: in the first place the bones are hollow, then the shafts of the feathers are hollow; and, finally, the feathers themselves are made of the most delicate filaments, interlocking and clinging to one another with little grasping hooks of microscopic fineness. Well, how does the bird fly? It seems simple enough to describe, and yet it is a problem that the wisest in such matters have not yet worked out to everybody's satisfaction. This explanation, by the duke of Argyle, appears to me to be the best. An open wing forms a hollow on its under side like an inverted saucer; when the wing is forced down, the upward pressure of the air caught under this concavity, lifts the bird up, much as you hoist yourself up between the parallel bars in a gymnasium. But he could never in this way get ahead, and the hardest question is still to be answered. Now, the front edge of the wing, formed of the bones and muscles of the fore-arm, is rigid and unyielding, while the hinder margin is merely the soft flexible ends of the feathers: so when the wing is forced down, the air under it, finding this margin yielding the easier, would rush out here, and, in so doing, would bend up the ends of the quills, pushing them forward out of the way, which, of course, would tend to shove the bird ahead. This process, quickly repeated, results in the phenomenon of flight.

THE GUANO CAVES OF AMERICA.

THE following has been sent to the editor of the Liverpool Courier:

SIR:—I have read with much interest your article on "Bat Guano" deposits in the United States of America. It is a subject to which I have given a good deal of attention, and have personally inspected several of these cave deposits in Tennessee, which were worked by the Confederate Government for saltpeter during the war.

These caves, however, are not to be compared with the deposits in Texas for richness in ammonia, nitric and phosphoric acids, owing to the fact that in Tennessee and Alabama there are frequent rains. This generally causes a stream to run through these caves, which washes out the ammonia, nitrates and phosphates from the deposit, and mixes it with other substances carried down by the water. Now in Texas there is but little rain; there are no streams in the caves, and the consequence is that many of the bat deposits in Texas are superior to much of the Peruvian guano now supplied. I have Dr. Voelcker's (the greatest authority on these matters) analysis of several samples of these deposits. He reports them to contain from 5 to 10 per cent. of ammonia, 10 to 15 per cent. of nitrate of lime, and a large quantity of phosphate of lime—in one case as high as 48 per cent.—with a large proportion of it soluble phosphate of lime, the value ranging from £8 to £11 a ton. W. J. M.

Floricultural.

WARDIAN CASES.

Wardian cases, properly constructed and cared for, are among the most beautiful of our winter plant adornments. The cases may be purchased of florists from ten dollars upwards, complete—or plans, in keeping with the windows in which they are to be placed, may be given to cabinet makers and constructed according to order. Those, however, whose purses are not upon friendly terms with their inclinations, may, if gifted with some mechanical skill, construct these cases for themselves, which, though less artistically finished, will serve every purpose, so far as the plants are concerned, just as well. In their construction, perfect drainage is first to be insured. Suppose we make our Wardian Case twenty inches long, fifteen inches wide for our first essay. The outside box should be at least six inches deep, with a moulding to receive the glasses, resting upon castors so that it may readily be moved.

The inside of this box must receive a dense coating of paint to arrest decay, and slant a little, thus inclining the water from the drip of the glass, as well as from the inner box, towards one end, where an outlet tube must be provided. Within this, and separated from it by little blocks of half-an-inch thickness, is the second box for the soil and plants. Now, in order to produce perfect drainage, this should be carefully lined with zinc, perforated with several holes also lined with zinc. Then cover the bottom with bits of charcoal, these with moss, and then fill with soil composed of three parts of mold to one of coarse sand.

The top glass may be placed so as to slide for ventilation or be removed entirely for half-an-hour or so each day. We may then in a few days after furnishing the case expose it to all the sun which a south window receives during the winter. Of course the amount of ventilation and exposure to sun must be regulated by the plants selected and by the temperature of the room.

The earth should be kept moist—never wet—the same as if the plants were growing in a greenhouse. As a considerable share of the moisture is confined by the glass, it will be seen that watering must be rarely and sparingly given.

Many use looking-glasses for the back of the case, which, in appearance, doubles its size.

Those who desire Wardian Cases for next winter, must busy themselves about it at once. Our woods will supply all the plants needed, and for our first attempt, they are perhaps better than the more showy tropical specimens that generally require more skillful management.

Let us mention first the Rattlesnake weed (*Hieracium venosum*). This is a low-growing, prettily-veined Composite plant to be found in most dry woods.

Chimaphila umbellata, the Prince's Pine, also common in the same localities, at once suggests itself as suited to Wardian Cases. Its stems are half-creeping, leaves leathery, serrate (almost erose sometimes) and of a deep-green color. The umbel is raised on a peduncle about four inches high, and bears four or more whitish flowers three-quarters of an inch diameter, with purplish stamens.

The *Goodyeras, repens, pubescens, Menziesi*—there is no striking difference between them;—the Trailing Arbutus (*Epigæa repens*), a shrubby little beauty, are all common in many highland woods. Several of the *Equisetaceæ* (Horse tails); of the Club Mosses (*Lycopodiums* and *Selaginellas*) and of the more delicate hardy Ferns make up a pleasing variety. But let us guard against planting too thickly. It is better to be patient in the beginning and pleased after awhile, than satisfied at once and disgusted when, from crowding and growth, a struggle for life begins and the luxuriance of our Fern Case ends.

Of the Ferns we may mention *Cystopteris fragilis, Aspidium fragrans, Asplenium pinnatifidum* and *ebenoides, Polypodium vulgare, Adiantum pedatum*.

Among tender plants adapted to Ferneries or Ward Cases (we may use the words synonymously for our purpose) almost any florist's catalogue offers extensive lists.

We have only space to refer to one of the very best, viz., *Fittonia argyroneura*, of which the illustration on page 185 is a correct sketch.

PREMATURE "FALL LEAVES."

The leaves in this drought-begirt locality are already displaying their fall tints—not only here and there, but as numerously as they are to be found in ordinary seasons, two weeks later. What is frequently attributed to frost may, therefore, be seen to be the natural termination of the life of the leaf which, owing to heat and dryness, has done its work a little earlier and a little less liberally, perhaps, than usual.

The leaf of a plant might well be selected as an emblem of fidelity. It labors every moment of its brief life for the benefit of the tree upon which it grows and, as soon as it ceases to be of service, disconnects itself, falls and decomposes—still serving the tree after death by its decomposition as in life it served it by separating its food from the atmosphere.

EXCHANGE.

Washington Ter., Waitsburg, Walla Walla Co.—Your kindness in putting the "Flower Exchange" in the Rural I am sure will be appreciated by all who have a love for flowers. I have quite a variety of flowers seeds, which I would send with pleasure to anyone who would care to have them. I will give a short list, viz., three varieties of Candytuft, twelve of Petunias, six or eight of French Poppies, (which are *beautiful* if they are *only* Poppies), five or six different colors of Zinnias, all colors of Moss, and three or four of Phlox. I would like some ornamental Grass and Immortelles, also Snapdragons.

I saw a piece in the Rural advising or favoring the culture of Huckleberries. I will try planting some seeds according to directions, and if you wish it, will write you my success. [By all means.—Eds.] We have planted a great many Cotton-wood trees here and they seem to be infected with borers of some kind. They eat out the heart of the trees, and then during some wind storm down will come some of the trees. It is very discouraging to plant trees and have them destroyed and not be able to prevent it. No one here has found a preventive.

Mrs. M. A. Ross.

NOTES.

At page 172, Sept. 11, of last year, may be found a sketch of the pretty double Ivy Pelargonium, named Konig Albert. It was introduced by Mr. Cannel, is pink in color, with deep carmine streaks down the center of the upper petals. We see now that Mr. Bull of Chelsea has raised seedlings from it, just as double as their august parent, of various colors.

Tricolor Seedlings.—We have germinated upwards of fifty seeds of the yellow-disked Pelargonium "Happy Thought," and not one of the seedlings has shown the faintest sign of variegation. Were Happy Thought a seedling instead of a sport, doubtless a percentage would have shown variegation.

Let those of our readers who are raising seedling Tricolors, bear in mind that unless the first leaves (cotyledons) are variegated the plant will not be—and upon this test they may implicitly rely. All those, therefore, bearing first leaves of a solid green, may be pulled up at once. Thus, as not more than one-quarter of Tricolor seeds will prove variegated, much time, labor and patient waiting will be saved.

Drought.—The drought in Bergen Co., N. J., is the most severe ever before known at this season. The air is blue with the smoke from the fires of meadows and woodlands, and the watercourses that never have failed before are as dry as a chip.

Nature's Wild Gardens.—There are few floral displays more beautiful than those which may now be seen in many meadows. The royal purple of the Iron-weed—the bright yellow of the Golden-rods—the white of the Wild Clematis (*Virginiana*)—the pink of the Asclepias—the crimson of the Cardinal Flower present a blaze of beauty that, unstudied, unarranged though it be, is rarely equaled in our most tasteful, costly grounds. Let those who have in view the planting of Wild Gardens visit such places. If they fail to get an idea or so, let them abandon the Wild Garden and devote themselves to in-door decorations.

GERMINATION OF SEEDS.

It was proved, says Nature, a short time ago, that several kinds of seeds will germinate between pieces of ice. A full investigation of the lower limit of temperature at which plants may germinate has recently been made by M. Haberlandt (*Centralblatt fur Agriculture Chemie*). The experiments were upon Wheat, Rye, Barley, Red Beet, Rape, Lucerne, Poppy, and many other seeds. Several hundred seeds were employed of each species, and every fourteen days the seeds were taken out of the ice-chest, whose temperature was kept constant between 0° and 1° C., and examined in a space whose temperature was under freezing point. In forty-five days a decided beginning of germination was observed in eight different species (which are named). In four months it had continued to progress in a minority of these: the rest had stopped. In fourteen species there was no germination. M. Haberlandt is of opinion that those seeds which can germinate at a lower temperature than others, and thus by artificial sowing in cold spaces a means is to hand of obtaining species soon ripe and needing little heat. Of all the seeds which had remained for four months in the ice-case, only a few were found capable of development when brought into a warmer temperature of 16° C. (61° F.).

The Vineyard.

HOW TO MAKE WINE.

Some varieties of grapes are better adapted for wine than others. The Catawba is grown in Southern Ohio extensively for wine making, and for 20 or 30 years was the only grape grown extensively in the United States for that purpose; but it is too late a grape for higher latitudes. The Clinton, Delaware and Concord are now grown as wine grapes, and some other varieties.

A grape to make pure wine, without the addition of sugar or spirits, that will not become acid, should contain sufficient saccharine matter to produce from 12 to 14 per cent. of alcohol; a good wine generally contains from 10 to 14 per cent.

This article is for the benefit of grape growers who desire to make a half barrel, or more, of wine, and I cannot recommend anyone to make less than 10 or 15 gallons, as it should be kept in a keg or a barrel, in order to be well fined.

Three barrels of grapes—as they are picked with the stems—will make a barrel of pure juice, or *must*, as it is called; and one barrel, or three bushels, will make ten gallons. When one prefers to add to the must, two pounds of sugar to the gallon—any of good quality—good wine can be made of almost any variety of grape; and if a gallon of spirits be added to 10 of must, besides the sugar, a little water may also be added, and the wine will keep well, and it will suit the American palate much better than wine made of the pure juice.

But there is an objection, with many, to using either sugar or spirits, and such people must be satisfied with a wine like the German Rhine wines—that Germans consider to be good, but Americans will often call very poor, being somewhat acid, and disagreeable to the palate. But why should even temperance people object to the addition of a little alcoholic spirits, precisely the same that the grapes naturally contain? If we make a "pure" wine of grapes that contain 14 per cent. of alcohol, what would be the difference in a temperance man's point of view if we make it 20 per cent? There is none, except in *degree*, and the wine that is used for common purposes is no more a "pure" wine than that made by adding sugar and spirits, only that it contains less alcohol.

The only alcoholic spirits adapted to the use of wine making, is what is called "pure spirits" by the makers and venders. It is of the same "proof," or strength, as brandy, whisky and rum, but it is perfectly tasteless, or without flavor, and it is used by rectifiers to adulterate the more costly liquors. It is now worth about $1.50 per gallon in quantities of five or ten gallons, and is only sold by wholesale liquor dealers. By using two pounds of sugar to the gallon of must, a good wine can be made of grapes that are not perfectly ripe; but the general rule is to leave the grapes till they are fully ripe, if the climate will admit this, then pick them and throw out any decayed berries, and mash them with the stems in a tub or barrel, if you have no wine mill; but the vessel must be perfectly clean and sweet. A whisky barrel sawed in two at the bung, well soaked, to draw out any whisky flavor it may contain, makes good tubs to be used in wine-making, but never use a tub that has been used for washing clothes.

A good masher is made of a piece of inch and a quarter plank, with a strip nailed on at about ten inches from the end on each side, forming an angle like the letter V inverted, with the handle of the mashers extending as far as these side pieces, by which three mashers are brought upon the grapes at once, each about four inches wide. About a bushel of grapes may be mashed at a time, then empty the pomace and juice into another tub, and so pound till all the grapes are mashed. Some wine makers leave the mash and juice 24 to 48 hours, in order to draw out of the skins a brighter color; and the stems of the grapes, by thus leaving the mash, impart a flavor to the wine that some people like.

The next operation is to express the juice, or must, and with a wine mill this is easy; but a barrel of wine, at least, can be easily expressed by putting about a peck of the mash into a strong cotton bag, as open as cloth can be found. Tie a cord around the end of the bag, then lay it upon a clean board placed on a tub, and press out the juice with the hands. But to do the pressing more effectually, make a lever, and secure the end, so that a good "purchase" can be obtained, then lay the bag on the board, or perhaps a plank would be better, over the tub, then place a small piece of board upon the bag and then apply the lever, and you will thus be able to express the most of the must, and then, if you please, you may put water upon the expressed pomace, mix it well, let it stand 24 hours and then go over the process of expressing again, but in this case sugar must always be added—two to three pounds to the gallon—to insure the wine from becoming acid the next season; but if one gallon of "pure spirits" to ten of must be used, only two pounds of sugar to the gallon will be required, presuming that you mix but about one gallon of water with the pomace to four of pure juice expressed. The "pure spirits" should not be turned in till the operation of the fermentation, which should be managed as follows:

Having procured your cask (iron-bound wine casks are best), clean it thoroughly, put in a key-faucet—the key to be kept in a safe place, so that no one can occasionally "try" the quality of your wine—then set it where it can remain fermenting, in the coolest part of your cellar, raised about a foot from the floor or ground. Fill the cask to within a few inches of the bung, so as to give the wine a chance to ferment, putting in the bung and having a gimlet-hole at the side of it, so that air may easily escape, and at the end, of about six inches, put in a spile tight, to be removed at the end of six hours to ascertain whether the fermentation has ceased, which may be known by the compressed air escaping, and if none escapes, either fill up the cask with "pure spirits," if you conclude to use it, or with some must reserved for that purpose.

Nothing more is to be done to your wine, and it will be fit for use after the next June; but the older the better. I have found no detriment from leaving the lees (sediment) in the cask; but some men "rack" off their wine after the second fermentation, which takes place as soon as warm weather commences the first season after it is made; but it is so slight that the spile does not have to be loosened. In all cases the wine will fine itself, and become beautifully clear in a few months.

I may here add that there is but little high-priced wine imported into the United States that has not been "doctored" before shipping it, by adding enough sugar and "pure spirits" to give it a body; and temperance men who do not object to "pure" foreign wines as a beverage, need not object to drinking American wine made on the same principle, as it is quite impossible to make wine from American grapes that will be drank by ladies unless sugar be used; and the use of a small quantity of spirits enables one, in all cases, to make wine that will not become acid. But still I would say to all grape growers, make only *pure wine*, if your grapes will do it, and the wine not become acid, if you will be satisfied with such a quality. American wines, "the pure juice," are generally considered to be "no better than sour cider" by most of our native citizens.

Linden, N. J.

THE CHAMPION (OR TOLMAN) GRAPE.

The "Champion" or "Tolman's Seedling" is the first grape in the market in Central and Northern New York. It is very early, but not otherwise commendable.

The above extract is taken from the Syracuse Daily Journal, of Aug. 30. I agree with the writer, except as to its "being very early." I have the "Tolman" (or Champion) and the Hartford Prolific, growing side by side, and, with me, it is not as well ripened as is the Hartford. It turns a dark color some two weeks before it is fully ripe, and can be sold to persons who do not know the difference between a ripe and unripe grape.

It was on sale in our market about the 20th of August, green and sour enough to "set the children's teeth on edge" for several generations to come. Dealers say that the first and second baskets sold freely, but after that the demand for grapes suddenly ceased. Nearly every dealer that I have seen has now (Sept. 4th) a basket of stale "Champions" that will finally have to be thrown into the gutter. It is a serious mistake for growers to sell this inferior grape in this unripe condition, as it greatly injures the market for the balance of the season.

Consumers are slow to learn the difference between this and those of a better quality. When dealers and consumers learn to leave this variety "severely alone"—as I fully believe they will at no distant day—then persons who raise good grapes will be able to get a fair compensation for their crops. I believe that this "Champion" has reduced the price of all other varieties of grapes in our market at least one-third for this season.

Probably it is a well-known fact that the "Tolman Seedling" originated near this city some eight or ten years ago, and after making a poor record, it has been rechristened the "Champion;" and, as a correspondent of the Country Gentleman truly says, "if a premium was out for sour grapes, this name would be very appropriate." When known and condemned under this new name, let us hope it will not "turn up" under any other guise.

Nelson Ritter.

Syracuse, N. Y.

RESPECTING THE PHYLLOXERA.

M. Maxime Cornu remarks upon the great difference between the changes produced in an organ still possessed of cambium or growing tissue and in an organ whose development is

completed, the elements being already formed and having now only to grow. When a Phylloxera attacks a very large root the effect is confined to the corky rind only, which becomes inflexed and thickened. On a slender root the cambium or growing tissue may be influenced by the puncture of the insect at some little distance on either side of the wound. In this case there is a formation of new tissue both on the outer and the inner side, and a swelling or hypertrophy results. When the insect attacks a rootlet it chooses by preference the vegetative point—there the elements are already formed, and have only to grow in certain directions, and assume their definite size. At the point of puncture the elements are arrested in their development, while the rest of the body of the root grows; hence, an inflexion and curvature at this point. The tissue whose growth is arrested is in contact with cells still growing actively; it therefore receives nutritive substances, which it does not use for itself, but stores them up in the form of starch. If the insects are numerous on the vine, all the rootlets are affected and ultimately die, the plant can then no longer absorb. It is then from its own stores that it draws the materials necessary for the ripening of the fruit and the production of new roots.

Domestic Economy.

ORIGINAL RECIPES.

To "J. C."

Brandy Peaches.—The fruit should be gathered before quite ripe; rubbed with a flannel to remove the down, pricked with a large needle to the pit in several places. Put them in cold water and boil them very gently until tender. Take them carefully out, and drain them. Make a sirup of three-quarters of a pound of fruit, add a pint of the juice in which they were boiled, and a pint of brandy. When the peaches are cold lay them in jars and pour the sirup over them.

Another.—Make a thin sirup of loaf-sugar. Pare the peaches a few at a time, or just enough to cover the bottom of the preserving kettle; boil until tender, remove them to a large platter, and cover immediately with a towel to prevent the air from discoloring them; proceed in this manner until all are cooked. When the peaches are cold place in glass jars, put a small teacup of sugar to each jar and fill up with white brandy. These are delicious.—Mrs. Rustic.

Piccalilli Pickles.—Will you ask your correspondents, who furnish so many recipes, if they cannot send one of the "Piccalilli pickles," for the benefit of a young housekeeper.

[Will some one of our correspondents please take notice and reply.]

SELECTED RECIPES.

Plum Preserves.—Plums may be preserved nice with the skins on or off. If on, they should be pricked at the top and bottom with a large needle. If you take them off turn boiling water over them. Prepare a sirup of a pound of sugar for each pound of plums, lay in your fruit to simmer, not to boil; let them remain in a scalding state until soaked through, at least two hours. Then skim out and boil the liquor down about an hour. It must be thick to keep well. The flavor will be much improved by boiling in the sirup half a pint of the kernels cracked.

Preserved Pears.—Cut the pears in half and take out the cores. Place them over the fire and boil them in a little water until they are just soft enough for a fork to penetrate them. Take them out and place them on a dish to drain. To each pound of fruit allow a pound of loaf-sugar; add the sugar to the water in which the pears were boiled, put in the fruit with the rind and juice of a fresh lemon. Boil the pears gently for fifteen or twenty minutes; take them out of the sirup, lay them on a broad dish until cold; then place them carefully in glass jars. Boil the sirup until thick enough, pour it over the fruit hot, and seal up.

Grape Jelly.—Take the grapes when ripe, put them over the fire in a preserving kettle, stir with a wooden spoon until all have burst, and the juice flows freely from them; strain through a thin towel, measure, then return the juice to the fire, boil thirty minutes, add three-quarters of a pound of loaf-sugar to each pint of juice, let it boil up, take off any scum that may rise. Pour into glasses; when cold, seal up.

Peach Pudding.—Scald two tea-cups of milk; stir in one tablespoonful of corn-starch wet with a little cold milk, beat the yelks of four eggs very light and add to the corn-starch when cool; beat all until light and smooth. Put a layer of ripe peaches pared in the bottom of a well-buttered baking-dish, sprinkle over a little sugar and pour the mixture over them; bake in a quick oven ten or fifteen minutes, whisk the whites of the eggs very stiff, add two tablespoonfuls of powdered sugar, spread over the pudding, return to oven until it is a delicate brown. To be eaten cold with cream.

Peach Batter Pudding.—Pare the peaches, set them closely together in a baking dish; make a batter of four eggs, the yelks and whites beaten separately; one pint of milk, six tablespoonfuls of flour mixed until perfectly smooth with the yelks; add a little salt, turn in the milk and then the whites; stir all together and pour over the peaches; bake slowly until done. To be eaten warm with wine sauce.

Hygienic Information.

PORK DIET.

Eds. Rural:—With your permission I have a little more to say on this question of a pork diet. One of the most important subjects for the working farmer to study is health, for without it labor is drudgery, but with it, if not in excess, and well rewarded, a pleasure. I think it not so much matter what we eat in a sanitary view as how we behave or rather how we treat ourselves and what are our surroundings.

The attention of the state health commissioners of some of the states has for a few years past been specially paid to these home matters, and the results of their investigations, as reported have shown that what we drink and breathe contain more of the seeds of disease than what we eat. This is not strange if what hygienists tell us is true, that miasma and other malaria affect the system only through the lungs and that some poisons may pass harmlessly through the stomach that would be fatal if introduced directly into the blood. As I have said in a former article fat pork though not containing *all* the elements necessary as food for the support of human life, does still contain in abundance some of the most essential ones and chemistry detects no essential difference in the fat of the different animals or their products with, butter, cheese and eggs. It is all carbon, hydrogen and oxygen in about the same proportions the difference in appearance being mainly in color, odor and consistence.

Cod-liver oil being nothing more nor less than animal fat is or has been a popular medicine in consumption or rather as one physician said to me, "not a medicine but a food" and when we understand that consumption is literally a burning up of the fat of the body and that as physiologists tell us that fats and oils are not materially changed by digestion, we can plainly see that a prescription of fats and oils in this disease is very appropriate. An acquaintance of mine though able to walk about town, was said to be in the last stages of consumption. I asked him what remedies he was taking? Cod-liver oil, was his reply. What food does your physician allow? Almost anything I like except fat pork. What is your own opinion of this prescription as to diet? I asked Why, says he, I thought of all the healthiest of my neighboring farmers and knew that they all ate fat pork. He died a few weeks after.

Another friend and relative was in a decline and pronounced consumptive and his physician prescribed cod-liver oil. As this article in the new country where he lived was rather expensive, I advised him to substitute pork gravy in his food and add whiskey and sugar, but he being a temperance man, (so was I) and I not being an M. D. my advise counted little. He went from Northern Michigan to New Jersey and then consulted an eminent physician who told him the pork gravy if as well relished was just as good as the cod-liver oil. He prescribed a rich diet with ale, porter and wine, under which he improved but died a few months after his return.

The time is fast marching on when the farmer will depend on bone and muscle alone for his forces; animal and vegetable chemistry and animal and vegetable physiology, are also forces within his reach. The coming farmer will know what elements he needs in his soil and in his foods and what he needs them for. Fats or oils are indispensible articles in our food. All the grains contain it but not in sufficient proportions to satisfy the demands of our appetites which crave butter or oily gravies and no article is so universally used to supply this deficiency as the flesh of swine and from the census reports of the number of sheep, cattle and hogs in the U. S., adding and deducting for the number imported and exported for the same year, I can come to no other conclusion than that swine's flesh is more eaten than the flesh of any other class of animals. Especially is this the main flesh food of farmers and out-door laborers, a class which statistics show to be the most healthy of any.

To my brother farmers who have been made to believe that fat pork is an unhealthy food and that in eating it they are swallowing disease, I have to say by way of advise look around you as my consumptive friend did and see how others are affected by it. Of course since the discovery of trichina you are cautioned against eating it now. S. B. Peck.

Muskegon, Mich., July 31, 1876.

The Poultry Yard.

KEEPING POULTRY.—No. 5.

I come next to interior arrangements of poultry houses. The windows should be made in such a way that they can be taken out or opened easily, and slats or wire substituted in hot weather.

It does not matter how cool a house may be built, our summers are too hot for it to be shut up. While the fowls are roosting they require all the air they can get—it would be better for their health if they could sleep in trees. I have looked into the coolest of houses on hot nights, and found the birds suffering severely for want of more air.

Another thing requires attention in some localities, that is, protection against thieves. Iron bars can be put on all windows, fastened to the frames, but not to the sashes, so that when the sashes are removed in summer the bars still remain useful—tire iron from old light wagon wheels will do, and can be had cheap in any country blacksmith shop.

Ventilation is one of the most important considerations in a building; that and cleanliness is of more consequence in keeping fowls than any other domestic animal, when a number are kept together, and why, is the great mystery, for it is a well-established fact (in spite of the marvelous accounts of the large numbers of breeds kept together we have in some poultry works) that a great number cannot be kept in health for a continued length of time in the same place without all the care is given, which experience shows to be imperative.

Make openings, with shutters to them, on two opposite sides of the house, quite *up to the ceiling*, that no foul air remains there, and so that a good current may pass through without blowing down upon the stock while roosting, which would be liable to give them cold. Of course the perches must not be up too high. On cold nights and very cold days, close the windward ventilators; but when it freezes hard in the house, the cold purifies the air in a degree, and rather than let the fowls freeze their combs, shut up every opening. From these hints one must judge of the severity of the climate of that part of the State he lives in. Give all the air that common sense dictates, but not enough to do injury.

I once observed, on visiting an amateur, that he had his buildings on the top of a hill, in which he kept various breeds. He had latticed rooms on the north sides of the houses and large doors opening into them. He had all the doors set open every winter's day (with the idea of ventilation). The biting wind howled through the building enough to chill a Polar bear. The birds inside were huddled together close to the glass (on the south side, to be sure), but its effect for warmth was more than neutralized by the doors open on the north, as the wretched appearance of the inmates plainly showed. It is needless to say that party voted pure-bred fowls a fraud. All his expensive arrangements were useless. The birds were blamed instead of the buildings and mismanagement.

Each domicile should have a small opening for the tenants to go in and out, near the ground. It is also useful to set a current of ventilation upward, and it should never be closed but in extreme cold weather. If there is danger of enemies entering by night through it, a grating can be placed before it instead of a close door. Also over the ventilators wire or slats should be placed to prevent fowls flying through them.

All fixtures should be so arranged that you can easily get at them for cleaning, such as nests, feed, hoppers, etc., and should be all moveable. Nest boxes can have one side higher than the other, when standing on a shelf, the high side turned to the next nest, answering a partition between without immovable wood work. Such nests can be dipped into a tub of whitewash and turned over to drain. The liquid, by dipping, enters every part, makes a thorough job of it and is done quickly. There are many such contrivances for economizing space in small places, which will be described in due time.

Perches should be flat and just wide enough for fowls to gripe. Shingle laths, planed and the edges rounded a little, make good ones. Let them lie loose (without nailing) in notches cut for them in bearers, so that they can be lifted out to clean them. Do not let the ends touch the wall. A good way is to have posts set in the floor, on which fasten the notched bearers. On these lay the perches. Be sure to have them sufficiently far apart that the fowls do not touch each other, for this would soon spoil their plumage, making them worthless for exhibition. Anyone can judge from these general hints how to adapt the principles to his means and accomodation. They do not call for any more expense and will, in the end, save much by the success of the first arrangements, avoiding the mistakes and alterations which so many have to go through in their first building.

Feeding vessels, pans, etc., should always be so constructed that stock cannot step into them, especially when soft food is used in the houses during winter. Some persons have all the fowls diseased from allowing them to puddle through the soft food, then into the dirt on the floor, then back into the food until it is perfectly filthy; afterwards they wonder what ails the fowls.

Drinking vessels should be similarly protected. Numbers of contrivances have been described from time to time, and others will appear in illustrations in the Rural in due time.

Much controversy has arisen about the best flooring. All condemn wood; cement is strongly advocated; but I prefer the earth strewn thickly with ashes, removing the entire surface, once every autumn, to the depth of four or five inches, replacing fresh earth and ashes, besides the ordinary cleaning once a week. H. Hales.

Sheep Husbandry.

WOOL ON A LIVE SHEEP.

The Trade Journal tells us that generally the finest and softest wool is on the shoulders of a sheep. But not one person in ten thousand is aware of this fact. Let us watch an expert when he is about to pass judgment on a sheep concerning the value of the animal for producing wool, and it will be seen he always looks at the wool on the shoulders first. A writer of extensive experience in rearing fine wool sheep and in handling wool, communicated the following suggestion for selecting a fine-wooled sheep:

"Always assuming the wool to be inspected is really a fine wool, we first examine the shoulders at the part were the finest and best wool is usually found. This we take as a standard and compare it with the wool from the ribs, the thighs, the rump, and the shoulder parts, and the nearer wool from the various portions of the animal approaches the standard the better. First we scrutinize the fineness, and if the result is satisfactory we pronounce the fleece in respect to fineness very 'even.' Next we inquire into the length of the staples, and if we find that the wool on the ribs, thigh and back approximate reasonably in length to that of our standard, we again declare the sheep, as regards length of sample, true and even. We next desire to satisfy ourselves of the density of the fleece, and we do this by closing the hand upon a portion of the rump and of the loin wool, the fleece at these points being usually the thinnest, faulty, and if it again gives satisfaction, we signify the fact by designating the wool 'even' as respects density. Now to summarize these separate examinations: If you find the fleece of nearly equal firmness from the shoulder to the thigh, of nearly equal length shoulder, rib, thigh, and back, and density on shoulder and across the loins, you may conclude that you have a perfect sheep for producing valuable wool. Selecting sheep for valuable feeders, is quite another thing."

SHEEP IN ARIZONA.

H. C. Banta of Banta's station, writes to the Stockton Independent from Little Colorado River, Arizona, giving some information in regard to the adaptability of that country for sheep raising. He says the grass is not suitable for sheep, having no juice in it for the nourishment of the sheep; the country is a wilderness of rocks and mountains and there is no water in it except at the streams, which are far apart and have but little water. Furthermore, it is a very hard route to go there from California, there being an interval of 200 miles where there is no grass to speak of and but little water. There is a poison which he does not describe, but which is very fatal to sheep and which swept off a large number of his flock. He thinks Californiia is a paradise compared with Arizona; advises Californians who contemplate taking a trip to that country to stay where they are; says he will return soon, and seems altogether to be thoroughly disgusted. He adds that he has not seen a sheepman in that country who is not anxious to sell out and go back home.

Sheep Eating Darling Pea.—In Australia there is a wild plant known as the Darling Pea, (a species of *Swansonia*), which is very injurious to sheep. It is said that some sheep are very fond of this plant others do not touch it, hence it is necessary to cull out those animals having a depraved taste, putting them in pastures by themselves. In examining sheep that have died from eating the poisoned pea the kidneys are found in a very unhealthy state. Salt has proved to be an excellent remedy as well as preventive, the same as with many of the affections which are common to sheep in this country.

"PROGRESS AND IMPROVEMENT."

PRICES ARE FALLING!

THE PRICE OF

THE RURAL REDUCED TO $2.50

TO SUIT THE TIMES.

Club Prices Reduced Proportionately.

Mindful of the great encouragement which has been extended to us in our efforts to improve THE RURAL, *we have concluded to show our appreciation of the same by reducing the price of* THE RURAL *to* $2.50 *per year,*

POSTAGE INCLUDED.

By doing this we ourselves pay the postage, which has heretofore been paid by the subscriber. In addition to this, we inaugurate a graduated scale of prices for small clubs, so that all who send names with their own, up to ten, can get a reduction for each name so sent. And for a club of ten or more, a beautiful premium in addition. Now that THE RURAL *has come down, let each subscriber send with his or her own name that of at least two neighbors. Those who wish to become new subscribers or agents can receive Specimen Copy and Premium List free. Address*

AN EYE TO THE FUTURE.

IF we could read the future, how easy it would be to guard against mistakes. Unfortunately, or fortunately, we can only judge of the future from the past, and this is, perhaps, all-sufficient for our welfare and happiness. But it must be confessed that comparatively few persons will study the past history of individuals or nations and learn how to avoid the mistakes of even their immediate predecessors; hence we see thousands dropping into the pitfalls already half filled with victims of imprudence, if we apply to them no worse or harsher term.

It would be an easy task to write a homily upon the follies of nations and people in general; but it is sufficient for our purpose at this time to speak of what may be termed the immediate future in agricultural and horticultural affairs. What may happen or be the condition of these great industries a hundred years hence, is of far less importance to the present generation than what is taking place now or likely to occur during the next two or three decades, although patriotism might induce some to look further into the distant future.

It may be all very well to "take no heed of the future" when one can be certain that all his wants are to be supplied without a personal effort; but who among us would expect to reap if we fail to sow? The landscape gardener in planting trees and shrubs for ornamental purposes, must look beyond present appearances, keeping in view what they are to become in the future, else his labors will in a great part be thrown away, and the one who fails to do this falls far short of being proficient in his art. It is not only necessary to keep an eye to what such plants may become if they thrive and grow to a natural size, but also to provide conditions in advance to insure this development. They may be planted far enough apart to permit their branches to extend without meeting any obstructions, while the roots are cramped within circumscribed limits by a tenacious, impenetrable or impoverished soil, the result showing very conclusively that a man, in planting a tree, needs to keep in view the future wants of the roots as well as those of the stems and branches. It is not altogether what a plant requires for its health and growth this season or next, but in years to come that should be provided, in order to secure a full measure of success in such operations.

Whatever may be true in horticultural affairs is also true in agriculture, and the farmer who does not look ahead and keep an eye to the future, is sure to run against some obstacle which will prevent further progress. The man who only looks to the present yield of his land, taking no heed of what may follow any particular system of culture, is pursuing a very injudicious course, to say the least. There has been far too much of this stumbling along in the dark regardless of consequences among our farmers, and the thousands of poor, worn-out farms found in almost every State of the Union, are the legitimate results. That a change is needed no one will deny; but how it is to be wrought, is a difficult question to answer, inasmuch, as we have already said, the failure or mistake of one individual is of no value as a protection to another, unless be studied and heeded.

We find one class of farmers who, in some way, manage to constantly increase the fertility of their land, their crops growing better and better with each succeeding year or decade, while with another class the reverse of this is seen, and although it might be difficult to say which were the more industrious, it is easy to see that there is a wide difference in the general management of their farms. No man can increase the fertility of his land without an "eye to the future;" and it is he who plows deep, underdrains, makes composts of all available materials, and never sells any crop in bulk which can be condensed into a more valuable product, leaving the coarser part for further increasing the fertility of his field, that will eventually be the most successful. If he keeps sheep, he does not count the wool and mutton sold as the only valuable product of his flock. He knows that the land upon which sheep are pastured is enriched, and when it is plowed up and grain sown upon it or planted with corn, the increase in yield should be credited to the sheep account.

The same "eye to the future" is required with every kind of stock kept and every kind of crop raised, and by doing so the profits are increased from year to year; for it costs no more to till an acre of land which will yield forty bushels of wheat or a hundred of corn, than one yielding one half the quantity. Among our readers there are doubtless many thousands of successful farmers who know from their own experience how necessary it is to look beyond immediate results in order to insure prosperity in the future; and we have only to regret that the hundreds of thousands of the unsuccessful could not be induced to subscribe for the RURAL NEW-YORKER or some other good journal from the pages of which they might learn how to avoid mistakes and be equally prosperous.

THE AMERICAN TRAMP.

THE Italians have their Brigands, which are nearly identical with the robbers and land pirates of many other countries; the Germans have their Gypsies, many close imitators of which are to be found elsewhere; but the American Tramp is an animal like itself only and not to be found in any other country. How this species originated or in what part of the country it first made its appearance, is a matter about which the authorities would probably disagree, if there were any authorities upon the subject. Suffice it for us to say, however, that it exists and in such proportions as to be a matter for serious consideration. It has no affectation for large cities nor crowded places, but chooses its paths in those districts where inhabitants are few and food plenty.

Where is there a farmer's wife or daughter who has not more than once been startled by the sudden apparition at her door (generally back door, too,) of one of these animals, humbly begging for a morsel of food, while its lynx-eyes were wandering over the place, to discover the absence of male protectors? In case such discovery is made, the humility is at once replaced by an expression of savage ferocity and brutality which generally works upon the fears of the housewife to the extent of a trifle of money or something better than even the proverbial generosity the American people naturally extend to the ordinary beggar. It seldom strikes higher than there is a probability of success in its demands. It seldom does any greater harm at any one place than giving the housewife's nerves a shock which lasts all day, and then stealing whatever little article about the place it can carry off and turn into money. But is this not enough? If not, then look over the daily papers and read the numerous exceptional cases where it commits murder on the highway—where it places obstructions on the railway track, wrecking a whole passenger train for plunder—where it finds school children in unpopulous rural districts and commits outrages worse than murder. These things are not matters of fancy attributed to this monster, but actual recorded facts of much too frequent occurrence for a civilized and law-abiding country like this.

Having pointed out a wrong, we are called upon to supply a remedy—no easy task in this case. One thing however, is certain. The multiplication of this animal known as the American Tramp, is a growing evil which, sooner or later, must be grappled with and overcome if we would have the enjoyment of life, liberty and the rights of property. The sooner it is done the easier it is of accomplishment; and even then only by united effort. It is useless to waste time in sickly, maudlin sentiment about never turning a beggar away from your door empty-handed. This sounds beautifully and has a Christian-like ring to it; but it won't do in cases where its exercise warms into vitality the viper to sting one's own breast. Let us provide public means of caring for those who really need and deserve charity and stop this promiscuous support of thieves, murderers and worse criminals under the guise of that charity under which is really a cover for lack of public spirit to take hold at the right end.

Charity is not the only motive for giving. Upon suggesting the above idea to a farmer once, the reply was that if the Tramp was refused anything, he would burn the barn and outbuildings. By this it will be seen that women and children are not the only ones who are frightened by this animal. Better might that farmer have divided his family into reliefs, armed them with guns and mounted guard over his buildings, than to have admitted the existence of such a motive. No doubt there was every reason to fear such a result in case of refusal; but did not the Tramp, who himself created the fear, well know its existence, and is this not a terrible commentary upon the animal?

The remedy is extermination of the species. Some localities have laws for the arrest and imprisonment of all who wander about without visible means of support. Where such is the case, see that the laws are enforced. Where such laws do not exist, make and enforce them at once. Don't delay, for time is of importance in this matter. Put a price upon the Tramp's head and make war upon him. Do not break the laws of the land in which you live, but make the laws the instrument to break up the business of the Tramp.

RURAL NOTES.

Mr. Waterer's Rhododendrons.—The show of Rhododendrons exhibited at the Centennial Show by Mr. WATERER of England, seems to have awakened an interest in these plants and our own raisers of them are likely to gain some trade thereby. There are doubtless thousands of persons who saw Mr. WATERER'S collection who are not aware of the fact that some of our nurserymen have expended thousands of dollars and years of time in ascertaining what varieties of Rhododendrons were best adapted to our climate, and we have only to say to those who know nothing of such things, leave the selection of varieties to our nurserymen instead of trusting to description in foreign catalogues.

Grain Weevils at the Centennial.—It is reported that the seeds and grain exhibited by the Brazilians at the Centennial are badly infested with moths and weevils. If this be true, it behooves those having this department in charge to see to it that none of these pests escape, for we have already enough of such enemies without adding any more. It may be that those infesting the South American farm products are the same species as those inhabiting both Europe and North America, and some of the Entomologists residing in Philadelphia or visiting the Exhibition, should report on these pests and let us know all about them.

Helping the Fruit Growers.—Col. ELLIOTT, founder of the "Florida Dispatch Line," for the transportation of fruit and vegetables from Florida to the Northern markets, tells the Committee appointed by the Fruit Growers' Association to assist him, that their labors in that direction amounted at most to an "approval by inference and a masterly inactivity." This is about the sum total of the labors of such committees in general, and we never have known one to do much more than try to sell their own fruits at the best prices and let others do the same or the best they could under the circumstances.

Winter Oats.—What are called "winter oats," are just now attracting considerable attention; but farmers in the Northern States should touch them with care, as it is not at all likely that they will survive the winter in cold climates. In Tennessee and southward it may answer to sow oats in the fall at the same time as winter wheat. We shall sow some of the best varieties of these so-called "winter oats," and give the results to our readers.

RURAL BREVITIES.

PHILIP'S SPIRAL CORN HUSKER, that peculiarly active machine that has such a persuasive way of denuding the ear of its husks, will be in full operation at the New York State fair. Look at it.

AN Association has been formed in Delaware for the raising of sugar beets and manufacturing of sugar therefrom. Anything which is likely to make the "sweets" in this life cheap and abundant, deserves support.

THE first number of the Factory and Farm, a bright-looking monthly published at Chicago, has just made its appearance among our exchanges. Its twenty quarto pages are filled with excellent articles and good illustrations, and we extend to it a cordial welcome, hoping that it may have a long and prosperous career.

BUSINESS NOTICES.

EVERY keg "Phœnix Pure White Lead" warranted *perfectly pure*—is white, fine, and has the very best body and covering properties.

THE WELL-DIGGER.

COME, listen all, while I relate
What recently befell
Unto a farmer down in Maine,
While digging of a well.

Full many a yard he dug and delved,
And still he dug in vain;
"Alack!" quoth he, "e'en water seems
Prohibited in Maine!"

And still he dug and delved away,
And still the well was dry;
The only water to be found
Was in the farmer's eye.

For by the breaking of the bank
That tumbled from the station,
All suddenly his hopes were dashed
Of future liquidation.

And now his sands were running fast,
And he had died, no doubt,
But that just when the earth caved in,
He happened to be out!

"Alas!—I have a happy thought!"
Exclaimed this wicked man—
"To dig anew this cursed well
I see a pretty plan:

"I'll hide me straight, and when my wife
And oke the neighbors know
What's happened to my digging here,
They'll think that I'm below!

"And so to save my precious life,
They'll dig the well, no doubt,
E'en deeper than it was at first,
Before they find me out!"

And so he hid him in the barn
Through all the hungry day,
To bide the digging of his well
In this deceitful way.

But list what grief and shame befell
The false, ungrateful man,
The while he slyly watched to see
The working of his plan.

The neighbors all, with one accord,
Unto each other said:
"With such a weight of earth above,
The man is surely dead."

And then the wife, with pious care,
All needless cost to save,
Said—"Since the Lord hath willed it so,
E'en let it be his grave." [*John G. Saxe.*

CONSTANTINOPLE.

THE capital of Islam is undoubtedly among the most prominent points of interest at present, in view of the Eastern difficulties. Constantinople, or Istamboul, as it is known to the "faithful," is delightfully situated on a triangular peninsula at the entrance of the Bosporus. The harbor, known as the Golden Horn, will shelter vessels of the greatest draught and 1200 ships can ride easily on its commodious surface. The population is estimated at one million Mussulmans, Armenians, Jews, Persians and Levantines, who pursue their usual avocations undeterred by the wide social and religious differences that divide them,—a human BARNUM'S Happy Family. A wall containing twenty-seven gates surrounds the town. The old streets are very crooked, and strangers find it most difficult to traverse the labyrinthian recesses Destructive conflagrations are not unusual. In 1865 some 8,000 houses, 20 mosques and numbers of baths, khans, etc., were devoured by the flames. The city is divided into districts, or quarters, which are usually occupied by different nationalities. The city presents a most charming appearance when viewed from the harbor near by. Its main characteristic is filth.

The markets, or bazaars, are large fireproof buildings, lighted from above, in which hundreds of tradesmen retail their wares. Open markets for the sale of horses are kept daily in several streets. The Avret Bazaar, or woman's market, was formerly set apart for the sale of female slaves.

The Sultan's residence of state is called the Seral Humayun. It is a small walled city of itself, nearly two miles in circumference, and includes mosques, baths, gardens, government offices, etc. Formerly it was inhabited by at least 6,000 persons and entirely inaccessible to strangers. Since free access has been gained, much of the romance and mystery surrounding the precincts have been dissolved. The outer gate of the seraglio is known as the Sublime Porte, a designation frequently applied to the Government itself.

The most noteworthy monument in the city is the Agia Sofia, formerly the Church of St. Sophia, originally built by CONSTANTINE and transformed into a mosque by MOHAMMED I. in 1453. It is built of light bricks and lined throughout with colored marbles. The dome measures 107 feet. The ceiling and arches are inlaid with beautiful mosaic work and gilt. The gallery, fifty feet broad, is sustained by columns, some of which are of green jasper, said to have been taken from the temple of DIANA at Ephesus.

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 173.]

INDIANA.

WHEN, in 1800, Ohio had been given a separate Government, the remainder of the country northwest of the Ohio was reorganized under the name of Indiana Territory. This was dismembered in 1805 by the erection of Michigan Territory, and in 1809, when Illinois Territory was created, leaving Indiana Territory circumscribed to the limits of the State of that name. Much trouble with Indians occurred before and during the war with Great Britain in 1812-15; but after peace was declared they were kept in control so far that their molestations were not sufficient to repel immigrants, and population rapidly increased.

In 1815 the Territorial Legislature petitioned Congress for admission to the Union, and there being no objection, after the usual formalities in December, 1816, Indiana was declared to be one of the United States, with boundaries as follows: East, by the meridian line which forms the western boundary of Ohio, being a north line from the mouth of the Miami; south, by the Ohio River from the mouth of the Great Miami to the mouth of the river Wabash; west, by a line drawn along the middle of the Wabash from its mouth to a point where a due-north line from the town of Vincennes would last touch the north-west shore of the said river and from thence by a due-north line until the same shall intersect an east and west line drawn through a point ten miles north of the southern extremity of Lake Michigan; north by said east and west line to the meridian of the west line of Ohio.

MAINE.

At the close of the Revolutionary War, the territory now comprised in the State of Maine belonged to and was under the government of Massachusetts, and so remained for many years. But in 1819 the question of separation, which had previously been agitated without success, was submitted to the people and as it was found a majority were in favor of a separate and State Government, the assent of Congress and of Massachusetts was obtained and in March, 1820, Maine became a State in the Federal Union, Massachusetts retaining ownership in a portion of the domain.

MISSISSIPPI.

In 1787 Mississippi Territory was organized. It embraced the country bounded by a line drawn from the mouth of the Yazoo River due east to the Chattahoochie, thence down that river to the 31° parallel, thence west to the Mississippi River—which was the western boundary. At that time the United States had only jurisdiction of the territory by consent of Georgia, in whom the right of soil vested. But in 1802, in consideration of $1,250,000 and a strip of land on its present northern border twelve miles wide, all reserved rights to all lands south of 35° latitude, were ceded to the United States. These were in 1804 annexed to Mississippi Territory, which then embraced all of the present States of Alabama and Mississippi above 31°. Spain had formerly made claim to all the territory, but had ceded it, with Florida, to Great Britain in 1763. This claim, however, had never been admitted by Great Britain to extend above 31°, and now Florida being divided by the Chatahoochie into East and West Florida, was restricted on the north to that parallel.

In 1779 the Spaniards captured Baton Rouge, and in 1781 took possession of Pensacola, claiming to have conquered the whole of West Florida as originally claimed by them, viz., to 35°. In 1783 Great Britain retroceded East Florida to Spain and the same year gave all above 31° to the United States. With this Spain was not content, and held possession of the "Natchez District" until 1798, when she relinquished all claim to the disputed territory insisting, however, on her right to all below 31° from the Chatahoochie to the Mississippi excepting the Isle of Orleans, and organized the District of Baton Rouge.

In 1810 the inhabitants of this District revolted against Spanish rule, and Gov. CLAIBORN of the then Territory of Orleans, with their consent and co-operation, took possession of the country for the United States, claiming it as a part of the purchase from France, and that the eastern line of that purchase was the Perdito River.

In 1817 that portion of the territory east of the present eastern boundary of Mississippi was erected into a separate territory and named Alabama. The remainder, having the requisite population who had agreed upon a Constitution satisfactory to Congress was, in December of the same year, admitted as a State.

ILLINOIS

Territory was made in 1809 and comprised all the country west of the Wabash River and Lake Michigan to the Mississippi. In 1818 the residents of the southern portion petitioned for admission as a State, but not being satisfied with the northern limit as fixed by the act organizing the territory north-west of the Ohio, (which was the south end of Lake Michigan,) instructed their delegate in Congress to ask for a boundary to be fixed farther north. At that time there was considerable anxiety in the country relative to the future of the great South-west. The scare caused a few years before by the expedition attempted by AARON BURR, was not entirely abated, and fears were still entertained that the Mississippi Valley States might choose to set up a government by themselves. Advantage was taken of this, and it was argued that Illinois, although by position a Northern State, if it had no lake ports, must necessarily seek an outlet for her productions through her rivers and the Gulf of Mexico, and thus naturally join her interests with the South-west; while, otherwise, if her northern boundary was fixed at 42° 50′, she would have sufficient lake shore for all necessary ports, a closer commercial intercourse with the Northern and Eastern States would ensue, and Illinois become at once a great power in support of the Federal Union forever. The propriety of the request was readily seen and an act passed admitting the State with a northern boundary at 42° 30′ as desired, and the wisdom thereof has never been questioned. At the same time that portion of the North-west territory lying north of Indiana and Illinois was added to Michigan Territory.

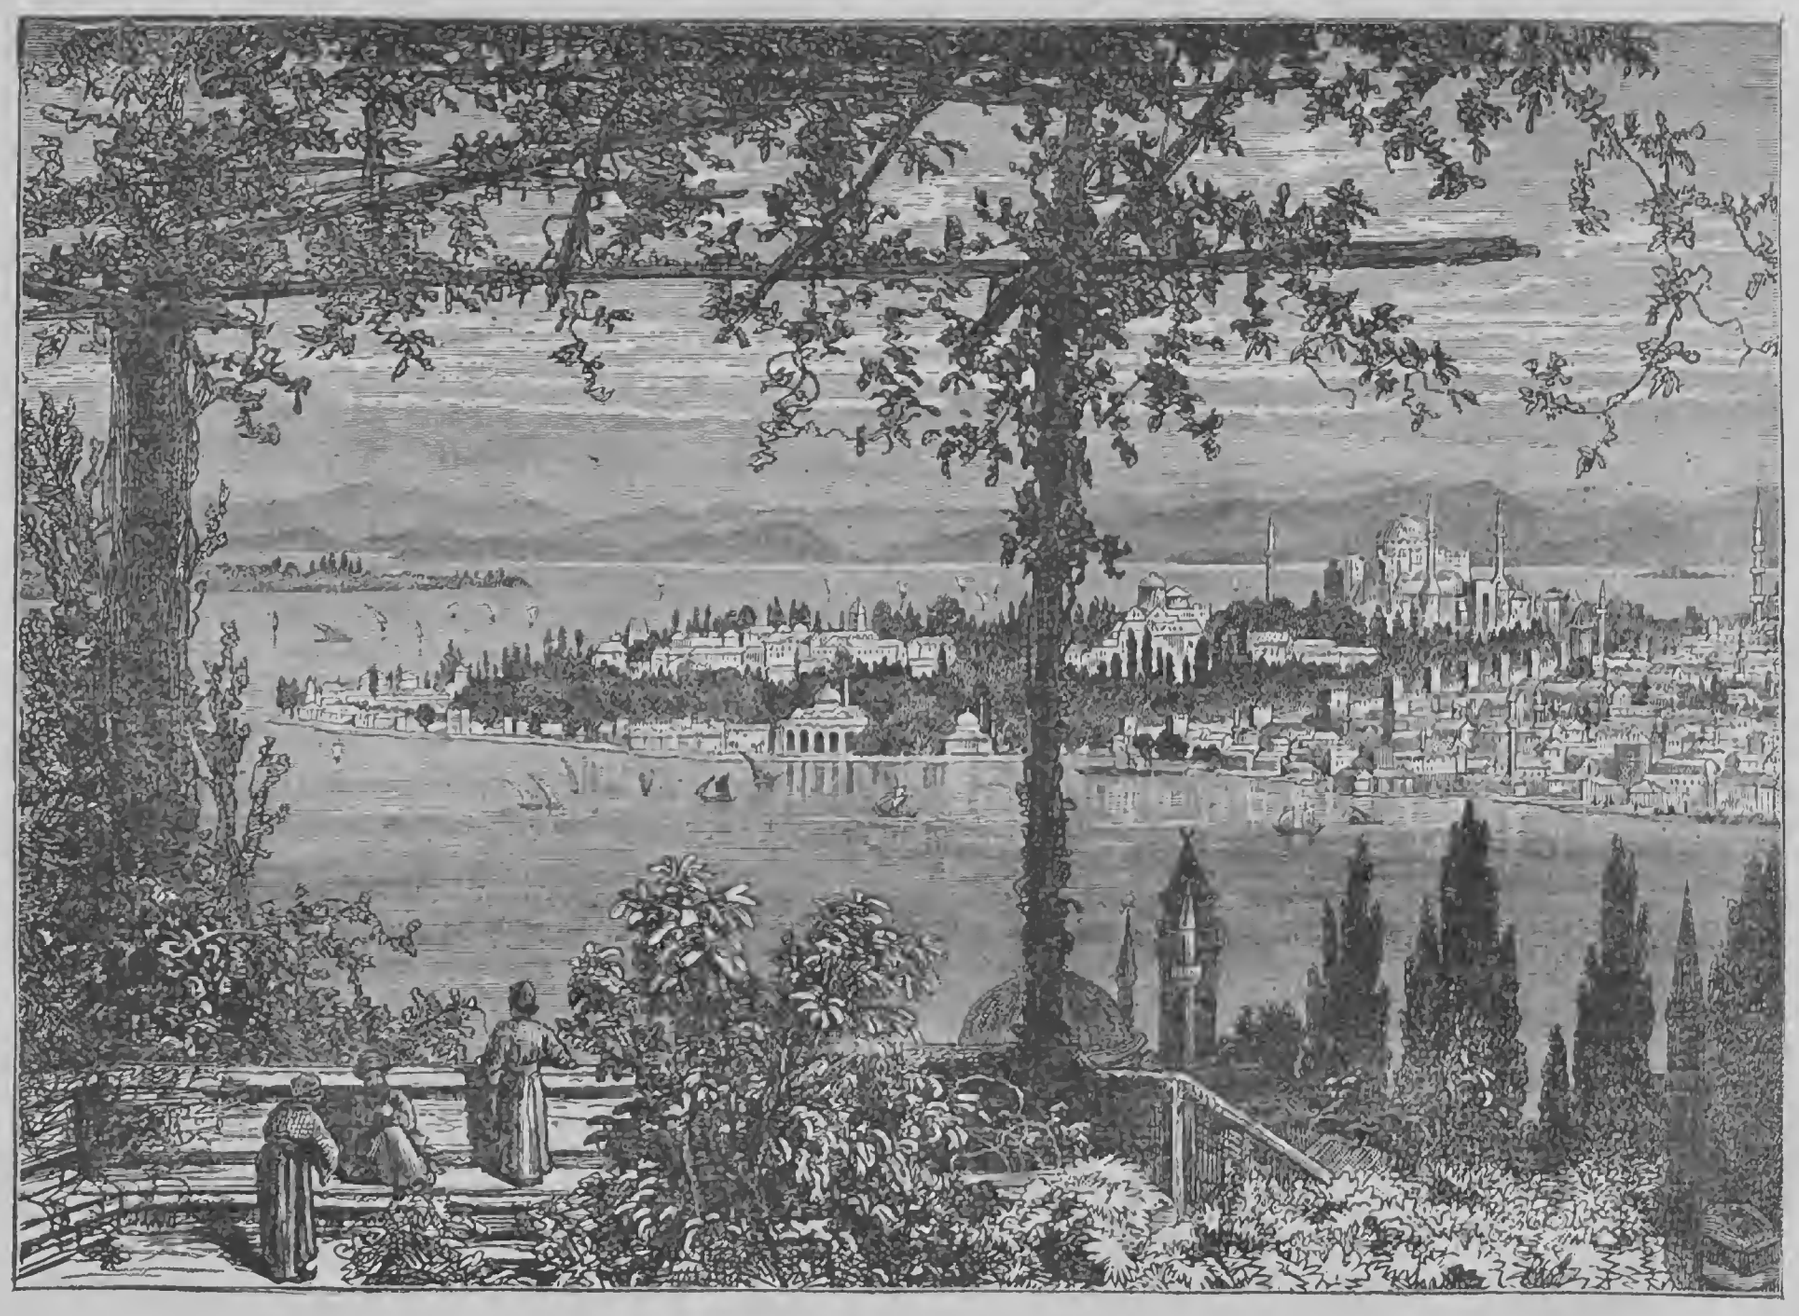
ALABAMA.

The early history of the country now comprized in the State of Alabama, was given in connection with Mississippi. A Territorial Government was made in 1817. Much trouble with Indians had retarded settlement; but a peace having been conquered, emigration from adjoining States became brisk, and in 1819 the State was admitted to the Union.

FLORIDA.

In 1690 Spain relinquished all country north of 33°; but Great Britain still encroached, and the borders were continual scenes of conflict and bloodshed. In 1702 war was declared between Spain and Great Britain, and during the next two years Gov. MOORE of Carolina, with an army of volunteers and Indians, overran Florida as far south as the settlements and extended west to the Appalachicola, but no definite change of bounds was made. Meantime, Carolina renounced Proprietary Government and was annexed to Great Britain as a Royal Province, extending from the Roanoke to the Savannah.

In 1732 this was divided into two Provinces, and about the same time Georgia was organized, extending from the Savannah River to the Altamaha, and was afterward extended to the St. Marys. In 1763 Spain ceded all Florida to Great Britain. In 1779, during the war between these two nations, Spain captured and took possession of Baton Rouge and in 1781 of Pensacola, and thenceforward made claim to the country west of Pensa



A VIEW OF CONSTANTINOPLE.

cola lying between the Gulf and 32° 30′ and, in consequence, objected to the southern boundary line of the United States being fixed by Great Britain in 1783 at 31°. West Florida was claimed by the United States after the cession of Louisiana, as a part of the original French possessions; all of Florida claimed by Great Britain was retroceded to Spain in 1783 and remained a Spanish possession until 1821.

That Florida and other territory lying on the Gulf of Mexico should be held by another power, was always an annoyance to the United States, and many troubles had grown out of it. From this arose the question of the navigation of the Lower Mississippi, which was settled, as we have seen, in 1803. During the war of 1812 with Great Britain, Florida furnished a convenient base of operations from which that power, with the connivance—or at least without the opposition—of Spain, sent parties to harrass the settlers and to incite the Indians to hostilities. British men-of-war appeared off Pensacola at intervals and landed arms and ammunition for the Creeks, many of whom were induced to enlist in the British army. Orders were sent to Gen. JACKSON, who had command of the army in the South, to seize Pensacola, but they were six months on their way. In the meantime, affairs became so serious that he determined to act on his own responsibility, and calling to his assistance such troops as were available, he crossed the Spanish frontier and entering Pensacola demanded that the British should leave the town and that neutrality should be preserved. The Spanish Governor protested his inability to compel the one or to assure the other. JACKSON immediately informed him that such being the case, he should take measures to insure a compliance with his demands. Upon this the British withdrew from the town and after blowing up a fort situated a few miles below, returned to their ships and put to sea.

Again, soon after the declaration of peace with Great Britain, troubles with Indians recommenced in consequence of their crossing from Florida into Georgia on pillaging expeditions. On one of the forays resistance was made and several Indians killed. This was followed by the Indians taking a steamboat on the Appalachicola River and putting to death all on board—men, women and children, about 40 in number.

At this time JACKSON was ordered by the War Department to invade the Indian Territory and "bring the war to a speedy and effectual close." As soon as possible he was on the ground and moving through the country seized the fort at St. Marks, on the ground that the officers of its garrison were aiding the Indians. Two Creek chiefs were decoyed on a United States vessel in the harbor and hung. When his forces appeared before Pensacola the Governor fled and the town surrendered. In one of the incursions into the Indian country two men, AMBISTER and ARBUTHNOT, traders, claiming to be British subjects, were captured, charged with aiding and abetting the Indians, tried by court-martial, convicted, sentenced and shot, an act condemned at the time and since as unwarranted, cruel and unjust.

The Spanish Government entered a protest as to the action of JACKSON in invading their territory; but as negotiations were already pending which were calculated to avoid all further trouble, by transferring Florida to the United States, no action was had on it. The necessity of the possession of Florida was apparent to Congress; but many disapproved of hasty action, averring that the country must, of necessity, soon be offered by Spain on almost any terms, as it was not only of no benefit to that Government but, contrariwise, a constant source of vexation and trouble.

Spain, however, pressed the matter, and at the same time made constant reference to the unlawful acts of the United States; for while Spain was well aware of worthlessness, to her, of Forida, she had a growing desire for the possession of Texas in which, although formerly claimed by France and at that time by the United States, she still felt an ownership by discovery and early settlement. A bargain was finally consummated and in 1821 Florida became the property of the United States, who agreed to pay thereof $5,000,000, the money to be used in satisfying the claims of United States citizens against Spain and to establish the south-west line of the United States from the Sabine to 32°, thence north to Red River and along it to 100° longitude, thence north to Arkansas River and along it to its head and to the 42° latitude, thence west to the Pacific.—To be continued.

The Story-Teller.

A WONDERFUL INVENTION.

BY SEVEN AND NINE.

B. CELLINI STUBBS is an inventor. He is also my friend. He has been "in the nine holes" of late but, thanks to a brilliant idea, is now in a fair way to realize in the immediate future immense wealth.

I feel the more gratified at this prospect from the fact that I hold divers trifling mementos,—echoes, as it were, of poorer days,—that are graced with STUBBS' really beautiful chirography and garnished with vows of numerals, while displaying a set phraseology in which the legend "promise to pay" occurs with painful regularity.

One blooming morning while I was discussing a frugal meal STUBBS burst into my humble apartments with hands outstretched and each separate hair doing a bit of enthusiastic waving on its individual hook.

"JONES, old boy, I have it!" he shouted; and at once fell to devouring what remained of my lonely chop. I thought, as I observed him, that there was no reason to doubt his assertion as touching my chop, and said as much.

"Oh, bless you!" he cried, as coherently as chops and coffee would permit, "it is not that I mean. It's my idea. I have it, I tell you. Fortune, glory, and all that, you know. JONES, (solemnly,) *there's* MILLIONS *in it!*" and without further ado, he carefully unfastened his coat, fumbled in his inner pocket and brought to view a tiny machine in outward appearance somewhat resembling a diminutive hand-organ. Holding it aloft, while a glow of conscious pride illumined his open countenance, he exclaimed in a tragic voice, "Behold!"

"Looks like the model of a clothes'-wringer, or a patent coffee-mill," said I. "What is it, STUBBS?"

"That, sir," responded my friend, solemnly, "I call the Harmonapoetleum, a wonderful piece of mechanism which is destined to win for me an earthly immortality."

"Harmona—what, old boy? Say it again and say it easy, will you?"

"The harmonapoetleum, sir," replied STUBBS, with dignity, "and I will thank you not to make it the subject of your unseemly jests."

"Well! what's the thing for, anyway?" said I; "is it a musical instrument? I suppose your word is good for all you assert, but I would just be pleased to learn how such an insignificant article can contain the equivalent of the sum you have so kindly mentioned. What is it, anyhow, a spice-mill?"

"Spice-mill! Thunder! It is a machine for producing poetry."

"Poetry——!"

"Now just arrest your quadrupeds please, or less elegantly, hold your horses, and I will explain at length. JONES, you are a lover of poetry and, no doubt, you have often done jeremiads over the decline of the noble art as exemplified in our hebdomadals. I have brooded over this subject long and earnestly and this is the result:—Here you have a bit of meerschaum—a mere toy, as it were—that is so ingeniously contrived that by turning this handle you set in motion a sort of divine afflatus—god-like wind, you know—that produces a really first-class article of lyric."

"Well, let's see it work," I exclaimed, now really interested.

"Certainly, of course; that's what I came for. Well now, you see this little screw? so—you turn it twice to the left, which acts on a piston that communicates with the parallax of the centrifugal eccentric motion, which at once sets the torsorial balance of the anti-friction main-spring—but never mind, that is mere detail that you can't be supposed to understand——"

I was just about coming to that conclusion myself, but I said nothing and STUBBS continued:

"You turn the screw, as I before mentioned, and behold, you have elegiac verse."

He suited the action to the word and, after a few revolutions of the crank, he opened a lid, drew forth a sheet of paper and read:

"MARY had a little lamb
Upon the Grampian hills
Come and join the praying band
For it's the pace that kills."

"Oh! come now, STUBBS!" I exclaimed, "that won't do. What do you suppose I am—a graduate of the Inebriate Asylum?"

"Hold on—just wait half a minute. That was a mistake. I turned the screw a half turn too many. Besides, JONES, the mechanism is new, and you can't expect it to be perfect on a half turn. Why, TENNYSON writes and rewrites his poetry a hundred times at least. But just observe—I pull out this delicate little stop and move the pointer on this small dial—remember it, don't you? Your old watch that I borrowed——"

"What! Have you ruined my dear mother's gift to construct this confounded monstrosity?"

"Softly, JONES. Science, my boy; all must give way to science. Now as I said, you——"

"Oh, bother! Start the old music-box——"

"See here, JONES; if you intend to——"

"All right, STUBBY; start her up. I unfurl my auricular appendages and am all attention."

"As I said then, you set this stop as I mentioned—this way—and you have the heroic verse—SCOTT and that sort of thing, you know. Now listen."

The crank was turned, the machine creaked slightly, and STUBBS produced the following:

"When Freedom from her mountain height
None but the brave deserve the fair
In thunder, lightning and in rain
But ah, the traitor was not there"—

"STUBBS, you are an unmitigated fraud. Here, let me have the machine; if there's any poetry in it I'll soon jerk it out."

"Go ahead," said the inventor; "go ahead, by all means, and if the machine don't make better poetry than that infernal drivel you are always writing, why, I'll eat it."

"Don't be personal, STUBBS; it isn't polite, you know. Now then, prepare to be astonished;" and I revolved the crank to slow meter.

STUBBS stood in breathless expectation, and for a few moments not a sound was heard but the faint creaking of the mechanism. Then there was a sharp snap as of breaking springs and the machine suddenly stopped.

We eagerly raised the lid and brought forth the following incomplete but beautiful and striking lyric:

THE JABBERWOK.

'Twas brillick, and the slithy tooes
Did gire and gimble in the wabe;
All mimsey were the borrogooes
And the mome-y raths outgrabe.
Beware the Jabberwok, my son,
The jaws that bite, the claws that eateh;
Beware the Jub-jub bird, and shun
The frumious Baldersnatch.

He took his vorpal blade in hand,
Long time the manxsome foe he sought;
Then rested he by the Tum-tum tree,
And stood awhile in thought.
And as in uffish thought he stood,
The Jabberwok, with eyes of flame!
Came whiffling through the tulgy wood
And burbled as it came!

One, two, one, two! And through and through,
The vorpal blade went snicker-snack—
He left it dead, and with its head
He came galumphing back.
And hast thou slain the Jabberwok?
Come to my arms, my beamish boy!
Oh, frugious day! caloo! calay!
He chortled in his joy.

I looked upon the miscreant STUBBS for one brief moment, and if his cheek had not been of the brassiest, he must have withered into nothingness before my reproving gaze.

"STUBBS," said I, "you are an idiot. Take away this fiendish invention before I lose my senses, or I will not be answerable for the consequences. I feel as if I ought to smash it over your addled pate."

"Ah! It makes you envious, don't it?" said STUBBS, scornfully. "The sublime poem it has just produced is far beyond your feeble comprehension——"

"Yes," I shouted, "thank Heaven, it is! If I could appreciate that gibberish I would move to Bloomingdale at once."

"Ah, you are only jealous," said STUBBS, "never mind; although *you* may depreciate my invention, the world will recognize its transcendent merits." With this he snatched the machine and hastily departed.

I have not seen him since; but if you find yourself the recipient of innumerable poems (?) that read as if the author had first been struck by lightning and then chopped them out with a meat-ax, I think you may safely conjecture that they are the joint production of my friend STUBBS and his wonderful "Harmonapoetleum."

GROWTH OF THE UNITED STATES.

THE American nation began its first century of existence with a population of 2,750,000. It has now, by the best estimates, 44,675,000. The area has been extended from 800,000 to 3,603,844 square miles. The development of agriculture under the pressure of immigration and the stimulus of mechanical invention, has been utterly without precedent. The value of manufactures has advanced from $20,000,000 to $4,200,000,000. Foreign and domestic commerce has taken gigantic strides. The development of mineral resources has not been the work of a century, but of fifty years. There were few banks in the Colonies in 1776; there are more than 6,000 now. Internal improvements and the common school system have kept pace with immigration.

While annexation has quadrupled our area since the Revolution, it has contributed very little to the population. The purchase of Louisiana, Florida, California and New Mexico brought in fewer than 150,000 inhabitants, and the acquisition of Texas and Oregon merely restored to citizenship those who had emigrated from the United States.

The aggregate area covered by population in 1790 was 239,935 square miles. The main line of settlements ran 1,000 miles along the coast from the mouth of the Penobscot to the Altahama, with an average extent inland of from 100 to 250 miles. A few pioneers had made their homes in the Ohio Valley; there were two or three patches of settlement in Kentucky; there was a village in Indiana and another in Michigan; and there were bands of adventurous spirits as far west as Illinois. The Louisiana Purchase in 1803, supplemented by the Oregon Treaty of 1846, added 1,171,931 square miles to the national domain; the Spanish cession in 1819 embraced 52,268 square miles; the annexation of Texas in 1845, the treaty of Guadalupe Hidalgo in 1848, and the Gadsden purchase in 1853, brought in 967,451 square miles; and finally, Mr. Seward's Alaska investment involved the acquisition of 500,000 square miles. The total area is now 3,603,844 square miles, or 1,042,000,000 acres, one-half of which are public lands. In surface extent three nations surpass the United States—the British, Chinese and Russian Empires. The arable land under cultivation is less than one-tenth of the total area.

"PARADISE LOST."

M. EDMOND SCHERER, a French writer, gives the following criticism of Milton's "Paradise Lost" in a recent work:—"'Paradise Lost' is a false, grotesque, tiresome poem; not one reader in a hundred can go without smiling through the ninth and tenth books, or without yawning through the eleventh and twelfth; it does not hold together; it is a pyramid balancing on its point—the most frightful of problems resolved by the most puerile of means. And yet, 'Paradise Lost' is immortal. It lives in virtue of some episodes which will remain forever famous. In opposition to Dante, whom we must read altogether if we wish really to possess his beauties, we must read Milton only in fragments. But these fragments are part of the poetic patrimony of the English race."

WHAT ARE TAXES?

THE axle on which the wheels of the State coach turn.

Periodical bleeding, prescribed by Government.

Feathers plucked from all birds to line the nests of a few.

The Nation's little account for board and lodging.

Sabbath Reading.

HOW MUCH I OWE.

WHEN this passing world is done,
When has sunk your glaring sun,
When we stand with Christ in glory,
Looking o'er life's finished story,
Then, Lord, shall I fully know—
Not till then—how much I owe.

When I stand before the throne,
Dress'd in beauty not my own,
When I see thee as thou art,
Love thee with unsinning heart,
Then, Lord, shall I fully know—
Not till then—how much I owe.

When the praise of heaven I hear,
Loud as thunders to the ear,
Loud as many waters' noise,
Sweet as harp's melodious voice,
Then, Lord, shall I fully know—
Not till then—how much I owe.

E'en on earth, as through a glass
Darkly, let thy glory pass;
Make forgiveness feel so sweet,
Make thy Spirit's help so meet;
E'en on earth, Lord, make me know
Something of how much I owe.

Chosen not for good in me,
Wakened up from wrath to flee,
Hidden in the Saviour's side,
By the Spirit sanctified;
Teach me, Lord, on earth to show,
By my love, how much I owe.

A SKEPTIC TESTED.

SOME time since a clergyman living in a community where skepticism and infidelity had led many astray, gave a series of discourses on the evidences of Christianity. Of course more or less of his opposers were present, and on the last night of the series a prominent infidel came in. At the close of a very impressive meeting the speaker said, in a spirit of tenderness:

"There may be, and doubtless are, some here to-night who do not believe as I do, and who do not accept the truth of the Bible. If there are any such, or if there is one willing to come forward and test this question of such vital interest to every soul, I invite him to the platform."

On the instant the infidel referred to came forward and said:

"I do not believe your doctrines—I cannot accept them."

"But," said the clergyman, "you have denounced for years that which you have never tested. Are you willing that I, who have tried Christianity and feel its truths, shall be your teacher, and will you submit to my directions? You say that you are honest in your belief and in an honest spirit you will meet me."

"I do thus meet you and I will allow you to be my teacher."

"Then," said the godly man, "kneel by my side and repeat the simple words, "God be merciful to me, a sinner!"

"But," was the reply, "I do not believe in your teachings."

"Well, you say you are honest and are willing to test this question; if so, you will heed my directions."

The audience, in hushed expectation, heard the infidel, as he sullenly kneeled, utter the words desired, with sarcastic defiance.

"Again repeat those words," said his teacher in tones of utmost gentleness; and again, still defiant, yet more subdued, the infidel repeated, "God be merciful to me, a sinner!"

Once more came the request to repeat the sentence and before the audience, held by the power of the Holy Ghost, that petition went up in a tone of almost tenderness, certainly far different from the bravado with which it was first repeated.

A fourth time came the request, "Repeat it again;" and, with his strong frame quivering with emotion, the poor man poured out his soul's need in the prayer of the publican.

At the fifth repetition the man then and there before the large assembly, offered up from his inmost soul the prayer which, when thus offered, meets with a forgiving Father's pardon.

We give the simple facts as told to us, and only ask the question of all unbelievers:—"Why will you denounce a faith which you have never put to the test?"—*Watchman and Reflector.*

DEFINITION OF BIBLE TERMS.

A DAY'S journey was 33 1-5th miles. A Sabbath day's journey was about an English mile. A cubit is 22 inches, nearly. A hand's breadth is equal to 3⅓ inches. A finger's breadth is equal to one inch. A shekel of silver was about fifty cents. A shekel of gold was $8.09. A talent of silver was $538.32. A talent of gold was $13,809. A piece of silver, or a penny, was thirteen cents. A farthing was three cents. A mile was less than a quarter of a cent. A gera was one cent. An epha, or path, contains seven gallons and five pints. A bin was one gallon and two pints. A firkin was seven pints. An omer was six pints. A bath was three pints.

WE are ruined not by what we really want, but by what we think we do; therefore, never go abroad in search of your wants; if they be real wants they will come home in search of you, for he that buys what he does not want, will soon want what he cannot buy.—*Colton.*

THE blush is nature's alarm at the approach of sin and her testimony to the dignity of virtue.—*Fuller.*

Ladies' Portfolio.

YOU AND I.

BY RUNE BLUFF.

'Tis many a year since we parted, dear,
Our hearts were free from care;
And summer skies were in your eyes,
And sunshine in your hair.

We knew not then what Time would bring,
But, like the young, we dreamed
That life must be to you and me
As bright as then it seemed.

I went where Duty pointed me,
With others' work to do;
Your path grew wide, and close beside
Another walked with you.

Love led the way, and though your sky
At times has been o'ercast,
Yet well we know, 'neath Love's warm glow
That clouds can never last.

The frost upon our foreheads show
Our summer-time's gone by,
The winter-chill of life's down-hill
Is left, and then, to die.

We cover all the sweets of life—
The shine and not the shade;
But tears to weep and pains to keep
Upon us all are laid.

And what they call the sweetest part
That one in life can find,
I had to turn with Duty stern,
And leave, far, far behind.

But some must work and weep, that joy
May fall to other's share,
And God knows best, within each breast,
Which heart would break or bear.

MAPLE BUDS.

BY MAY MAPLE.

No. V.—Aunt Julia's Advice.

"And you're goin' to housekeeping next month?" said Aunt JULIA to her niece, Mrs. ANNA HARRISON. "Well, I'm glad to know that you are so sensible; most young married people have an idea that it is too much trouble and r'ally is almost a disgrace, if they're not able to board in a first-class hotel for a year or two.

"I s'pose they want time to air all their weddin' fixin's 'fore they settle down in good 'arnest to the business of housekeepin'. Well, as I said afore, I'm glad you belong to the sensible class. I s'pose you have l'arned how to git a good, substantial meat of victuals; so, if your servants should chance to leave you in the 'hiks,' as the sayin' is, your husband will not be obliged to go away from home to get a 'square meal.'

"Now, what I mean by a *good substantial meal*, is this:—Good light bread; home-made, of course; sweet, well-worked butter, well-cooked potatoes, (which, by the way, only half the folks know how to cook that pretend to), and ideely fried or broiled meat of whatever kind ye like. Them four articles are *r'ally* the staff of life. As for the French dishes, there are plenty of recipes to guide one.

"Now don't be 'fended, ANNA, if I give ye a leetle advice. You know I'm a good many years older than you, and have had 'siderable experience in the course of my life.

"In the first place, try always to keep your person tidy and your house in order. Don't leave everything to the care of servants: don't sweep your carpets unless necessary, for every time you use the broom you must take some'at from its beauty. Before your rooms are swept, cover those articles of furniture that are likely to retain the dust with a paper.

"If you want to keep your beds in good condition, put on the under sheet so it will completely cover the feather tick; if this is done *every* time the bed is made you will seldom, if ever, need to wash your beds. Mine have been in use nigh onto forty years and yet look bright and almost new. A great many folks throw their beds upon the grass and leave 'em there two or three weeks at a time, through storm and sunshine.

"Such work as that is pure shiftlessness. It shows slovenly habits and a lack of economy. The ticking rots; the feathers mold, and git so matted together that they are utterly ruined. I remember trying to sleep on such a bed when I was a gal. And what a night I spent between the bunchy uneven feathers and the terrible musty odor from them; it was utterly impossible to git a single wink of sleep the whole night through. The window consisted of four small panes of glass and was immovable. I tell you, I didn't form the highest 'pinion of that housekeeper.

"Be sure to make your comforts and counterpanes large enough to tuck about the bed nicely, and your guests will enjoy their rest much better on a cold winter's night. Don't be so anxious to get rich that you must neglect the orderly way of arranging your table at meal time. Be sure that each dish is properly seasoned.

"Your uncle says:—'Mrs. T — is a good cook; but the way things are thrown upon the table is perfectly disgustin', and enough to spoil the appetite of an epicure.'

"This is because she is al'ays in such a hurry. She walks, talks, works, eats and sleeps in a hurry. 'There's time for all things,' the wise man says. And we shall find it so, if we take hold of our work systematically.

"Have your spoons and cutlery cleaned immediately after using; for they will soon be blemished with dark stains and, perchance, rust if you don't. And then their beauty is forever marred. In your semi-annual house cleaning, don't tear up every room in the house and make a perfect Babel of your home. Be sure to have at least one room or place in comfortable order. Many a lady has lost the acquaintance of people who would have given her life-long pleasures, by being unable to give a passing stranger a comfortable resting place and a few refreshments, because she was cleaning house.

"One is often interrupted in such work, and how much mortification it saves to have a few things always in order. It's a pity houses cannot be always in order without this extra labor and confusion.

"Let your 'conomy of time be such that you can have at least half an hour for mental cultivation. Read something that will give you pleasant thoughts while your fingers are engaged in useful employments. If you do not read, spend the time in writing to some long-neglected friend; you may do a great deal of good in this way if you choose—possibly save some soul from falling into temptation and committing some fearful crime. Kindly-worded letters are welcomed as angelic visitors.

"If you are watchful over the affairs of your house, your loved ones will respect and love you. And you will continually rise in your sphere of usefulness. Having learned to be faithful over the multitudinous cares of this life, don't forget to keep the heart ever in order, that you may receive the commendation of the Father above."

FASHIONABLE WOMEN.

FASHION kills more women than toil and sorrow. Obedience to fashion is a greater transgression of the laws of woman's nature, a greater injury to her physical and mental constitution, than poverty and neglect. The slave-woman at her tasks will live and grow old, and see two or three generations of her mistresses fade and pass away. The washer-woman, with scarce a ray of hope to cheer her in her toils, will live to see her fashionable sisters die all around her. The kitchen-maid is hearty and strong, when her lady has to be nursed like a sick baby. It is a sad truth that fashion-pampered women are almost worthless for all the ends of human life. They have but little force of character; they have still less power of moral will, and quite as little physical energy. They live for no great purpose in life: they accomplish no worthy ends. They are only doll forms in the hands of milliners and servants, to be dressed and fed to order. They dress nobody, and save nobody. They write no books; they set no rich examples of virtue and womanly life. If they rear children, servants and nurses do all, save to conceive and give them birth—and when reared, what are they? What do they ever amount to but weak scions of the old stock? Who ever heard of a fashionable woman's child exhibiting any virtue or power of mind for which it became eminent? Read the biographies of our great and good men and women. Not one of them had a fashionable mother. They nearly all sprang from strong-minded women, who had about as little to do with fashion as with the changing clouds.

COMMON THINGS.

MANY admirable actions are overlooked by us, because they are so little and common. Take, for instance, the mother, who has had broken slumber, if any at all, with the nursing babe, whose wants must not be disregarded; she would fain sleep awhile when the breakfast hour comes, but patiently and uncomplainingly she takes her timely seat at the table, Though exhausted and weary, she serves all with a refreshing cup of coffee or tea before she sips it herself; and often the cup is handed back before she has time to taste her own. Do you hear her complain—this weary mother—that her breakfast is cold before she had time to eat it? And this not for one, but for every morning, perhaps, through the year. Do you call this a small thing? Try it and see. Oh! how woman does shame us by her forbearance and fortitude in what are called little things! Ah! it is these little things that are tests of character; it is by these "little" self-denials, borne with such self-forgotten gentleness, the humblest home is made beautiful, though we fail to see it, alas! until the chair is vacant, and the hand that kept in motion all this domestic machinery is powerless and cold.—*Valley Farmer.*

WORDS OF WISDOM.

Good the more communicated, more abundant grows.—*Milton.*

MANY people are like eggs—too full of themselves to hold anything else.

SOCIETY we must have; but let it be society, and not exchanging views, or eating from the same dish.—*Emerson.*

THIS is a Gaelic proverb:—"If the best man's faults were written upon his forehead, it would make him pull his hat over his eyes."

IT has been seen too often, both in philosophy and elsewhere, that when people have fancied that the world was becoming Christian, Christianity was, in fact, becoming worldly.—*J. C. Hare.*

IT were better to have no opinion of God at all than such an opinion as is unworthy of him; for the one is unbelief, the other is contumely, and certainly superstition is the reproach of Deity.—*Lord Bacon.*

FAITH builds in the dungeon and the lazar-house its sublimest shrines; and up through the roofs of stone, that shut out the eye of heaven, ascends the ladder where the angels glide to and fro—prayer.—*Bulwer Lytton.*

Reading for the Young.

LITTLE MISCHIEF.

BY MRS. E. P. MILLER.

LITTLE Master Mischief
Lives in NELLIE'S eye,
Sitting in the corner,
Peeping out so sly;
Now he's crossed the snow-ground
And in chamber blue,
Thinking he is hidden,
Peek-a-boos at you.
Now he drops the curtain,
Sure that he is hid,
But you see him dancing
Even on the lid.
Now, the curtain lifting,
You can see he's crept
To the inner chamber,
Where the love-light slept.
Watching now his moment
He pops out, and see
Mamma's spools and thimble
Quickly disagree.
Shall we punish Mischief?
Better teach the child
How to hold and lead him,
Running now so wild.

Would she like her playthings
Scattered here and there,
When she had arranged them?
Would she think it fair?
Would she like her puzzle
Portions of it, lost?
Would she like her dishes
Everywhere up-tossed?
Would she like her apron
With a missing string,
Mama hunting, meanwhile,
Thread and everything?

NELLIE, learn the lesson:
Be to others true,—
Always do as you would
Have them do to you.
This the dear LORD'S precept,—
This the Golden Rule,—
This the hightest lesson
In our NELLIE'S school.

UNCLE TRUE AGAIN.

DEAR NIECES AND NEPHEWS:—When I asked you to send me a sketch of the life of Joan of Arc, I rather flattered myself I had given a "real hard one," and the old fellow chuckled to himself. Judge of my surprise and delight when I received nearly fifty responses. To read and discriminate has been a labor of love,—and perplexity. I have selected the best, longest and shortest accounts which are given below *verbatim*. I consider that both are excellent and reflect credit on the writers. Strange to say all the contributions are from my young nieces, not one nephew having had the temerity or talent to compete. Boys, this is all wrong! Now, while the articles are good, they are not perfect by any means and I print them *precisely* as they were written that our whole family may have an opportunity to criticize them, point out errors of every kind and give their candid judgment of the productions. This must be done in a kindly spirit—we cannot afford acrimony in our united family—and to the end that writers and critics may be improved by the interchange of opinion. The successful young ladies will each receive by this mail an engraving of Sir John Gilbert's beautiful water color painting of Joan of Arc, as a slight reward for their efforts.

Now, sharpen your pencils and away with you.

UNCLE TRUE.

JOANNE OF ARC.

BY BESSIE M. MCLEAN.

IN the village of Donnemy La Pucelle, on the frontiers of Lorraine lived a country man whose name was Jacques d'Arc. He had a daughter named Joanne of Arc who was at this time in her twentieth year. Joanne was a very solitary girl and had often tended her sheep for days in the wild hills which surrounded her home, where no human being was seen or heard. And often while the remainder of her young companions were singing and dancing merrily under the trees, Joanne would steal quietly off by herself to the little village chapel of our Lady of Bellemont, where she would stay for hours twining beautiful wreaths to decorate the images of the various saints which stood in the chapel, or gazing dreamily at the altar with the dim, flickering light burning before it, until to her excited fancy she seemed to see shadowy figures floating before her and even speaking to her. The inhabitants of that part of France were at that time very ignorant and superstatious, so they were easily persuaded that Joanne saw and heard visions and voices; and they looked upon her with a sort of reverential awe, as one with whom angels and holy spirits had communion. One day Joanne came home from the chapel and told her father that a vision of the Lady of Bellemont had appeared to her and commanded her to go and raise the siege of Orleans. Her father tried in vain to dissuade her, but Joanne told him that she must go as heaven directed to help the Dauphin and remain with him until he was crowned at Rheims.

In February, 1422, she presented herself to the governor of Vancouleur, Robert de Bandricourt. When his servants told him that a peasant girl named Joanne of Arc wished to see him, because she had been commanded by heaven to help the Dauphin and save France, Bandricourt thought she was insane and ordered his servants to send her away. Joanne however remained in the city and soon Bandricourt heard such accounts of her piety and wonderful visions that he sent for her and questioned her. The result of this interview was that Bandricourt equipped her properly and sent her to Chinon, in Lorraine, where the Dauphin was. When Joanne arrived in Chinon she was, after a short delay, admitted into the Dauphin's presence; pointing him out from among all his court, she told him that she had come commanded by heaven to subdue his enemies and conduct him to his coronation at Rheims, and finally she told him that there was an old sword with five crosses on its handle, buried under the altar of the cathedral of St. Catharine at Fierbois. Nothing had ever been known about this before, but when the altar was examined, the old sword was found as Joanne had said. This was regarded as a sure proof of her inspiration. Accordingly Joanne rode to Orleans on a white war horse and clad as never peasant girl was clad before, in a suit of glittering armour with the old sword in her belt and a white banner carried before her on which was a picture of the Virgin Mary with Christ in her arms and the words, "Jesus Maria;" in this splendid state, escorted by a large body of troops she appeared before the starving inhabitants of Orleans. When the people beheld her they exclaimed with cries of heartfelt joy, "The Maid is come; the Maid of the prophecy is come to deliver us!" These cries and the sight of the Maid fighting at their head inspirited the French and intimidated the English so that their line of forts were soon broken and Orleans was saved. Joanne, henceforth called the "Maid of Orleans," remained within the walls a few days and then caused letters to be sent to Lord Suffolk, ordering him to depart with his troops from before the city walls according to the will of heaven. Finding her commands not obeyed, the "Maid of Orleans" advanced against him. The besiegers held the bridge and here the Maid of Orleans attacked them.

The battle was twelve hours long. During the fight the Maid of Orleans while planting a scaling ladder, was struck by an arrow in the neck and fell in the trench; noticing that her soldiers seeing her fall had become disheartened, Joanne sprang up and pulling the arrow with her own hand from her neck rallied them on to victory. The English lost the bridge and were driven from the place. Lord Suffolk took refuge in the town of Jargeau where the Maid of Orleans besieged and took him prisoner. After this new success of Joanne's several places which had before held out against the Dauphin were now delivered up without a battle, and at Patay Joanne of Arc defeated the rest of the English army and the Lilies of France and the Maid of Orleans banner waved victorious over a field where twelve thousand Englishmen lay dead. Joanne now urged the Dauphin to proceed to Rheims and be crowned so that she might be enabled to perform the last part of her mission. Soon they set forth with an army of ten thousand men and again the Maid of Orleans rode at the head of an army in her shining armour.

After some time they arrived at Rheims and in the great cathedral at Rheims the Dauphin was crowned Charles the Seventh. After the coronation Joanne kneeled before the King and said with tears that all the recompense she desired, was to be allowed to return to the beloved home of her youth. But the King said "No," and made her and her family noble and settled upon her the income of a Count. Ah, titles could little repay the Maid of Orleans for the loss of the quiet home in her own loved village; gladly would she have exchanged her wealth to have been allowed to go back to the wild hills and little chapel and be again the beautiful peasant girl, Joanne of Arc. It was not to be, and she still continued helping the King. Many times however, she besought the King to allow her to go back to her home, but Charles, with base ingratitude, always refused. Soon the King marched on to Paris, which was opposed to him, and attacked the suburb of St. Honore. In this fight Joanne being struck down into a ditch, was abandoned by the whole army. She lay wounded and forsaken in a heap of slain whence she crawled as best she could. Soon after this Joanne broke the old sword and many said that her power was broken and destroyed with it. At last, at the siege of Compiegne, held by the Duke of Burgundy, she was basely left alone in a retreat and fell into the hands of the English. Unhappy Maid of Orleans, deserted by her friends, reviled and persecuted by all! Ungrateful Charles Orleans saved himself, was crowned, and with what a *Kingly* recompense he repays her! Scorn and utter indifference.

After being tried for witchcraft the Bishop de Beauvais bought her for ten thousand francs and shut her up in a narrow prison. Poor Joanne of Arc, no longer now the renowned Maid of Orleans, and yet more talked of and disputed about than even when she was the Maid of Orleans. Sixteen times was the unhappy Joanne brought out and argued with until she was heart sick of her dreary life. The last time she was taken to a burial ground in Rouen horribly decorated with a scaffold, stake and faggots. To save her life she signed a paper with a cross that all of her visions had come from the devil; upon this she was condemned to imprisonment for life, "On the bread of sorrow and the water of affliction." They soon found an opportunity to take her out of prison and try her for sorcery. She was found guilty and condemned to be burnt to death and in the market place of Rouen, the deliverer of the French, Joanne of Arc, was burnt to death. Her last word was "Jesus." A bishop standing near burst into tears and exclaimed "truly she was a Christian." Her ashes were thrown into the river Seine, where the waves weep their sad requiem over her to this day. Wicked deeds seldom prosper and the English cause gained no advantage from the death of the Maid of Orleans. The war wore heavily on; the

Duke of Bedford died and Lord Talbot became a great general. But the fearful followers of war are famine and pestilence. Both these horrors broke out in both France and England, lasting two years. The war went on again, and within twenty years after the Maid of Orleans' death, the town of Calais was the only French possession of the English.

ANOTHER VERSION.

DEAR RURAL COUSINS:—I write to tell you what I know about JOANNE of Arc. She was a French peasant girl and her real name was JOANNE LA PU CELLE. While tending her flocks, she became inspired with the thought that she was to be the deliverer of France, as there was a tradition that her country could only be saved from the hands of its enemies by a virgin. She deemed herself the chosen one and claimed to have received a message from heaven to that effect. She succeeded in persuading her friends and some others, among them the king himself, that she was the virgin who was to lead the armies of France. At first, King CHARLES doubted her and challenged her to single combat with himself, as a proof that she was what she pretended to be. He yielded her the victory and permitted her to lead the armies of France. The English forces at that time were besieging the City of Orleans. Through her leadership, the French compelled the English to raise the siege and JOANNE was considered a heroine, the savior of France. She next urged the king to march to Rheims, in order to assume the crown of his ancestors. He consented and was crowned in the great cathedral. JOANNE then declared her mission ended, but her services being still needed, she stayed in the army and a short time after fell into the hands of the English, by whom she was burned by order of the Earl of WARWICK, on May 24th, One thousand four hundred thirty-one.

Spring Hill, Kansas. LYDIA MOORE.

LETTERS FROM BOYS AND GIRLS.

Praise.

DEAR RURAL:—Seeing that the Boys' and Girls' Column in the last paper was so interesting, and as you were so kind to publish my other letter, I am tempted to write again. I have been to the Centennial. I wonder if I saw any of the RURAL Cousins there? I would have been glad to have recognized them. I am spending the summer with my grandparents among the Catskill Mountains. When at home I have a piano to play on, and while here a melodeon, which makes it very pleasant for me, as I am very fond of music. I don't agree with YOUNG ARTIST about piecing quilts, for I am piecing one myself and see the use of it. But I do agree with CRITIC about tobacco, and I think if the young men and boys who smoke cigars or use tobacco in any form knew what some of us girls thought of them, they would stop it forthwith. At least, I hope they would. I think YOUNG EDITOR'S letter is splendid, as he says, "Let us have a lively campaign this summer."—ELLA, *Greene Co., N. Y.*

He Notices an Improvement.

DEAR RURAL GIRLS AND BOYS:—I have been very much interested in reading your letters. I am very fond of flowers, but we do not cultivate them to any great extent. I think that the Editor is very kind to devote so much time and attention to us children. Some grown-up people seem to forget that they were once young. I think that the letters in the RURAL are getting better and better.—NORMAN K., *Livingston Co., N. Y.*

The Puzzler.

BIBLICAL ENIGMA.

I AM composed of 42 letters:

My 40, 8, 2, 18, 35, 3, 10 a place where Jesus preached.
My 14, 9, 26, 14, 12, 6, 11, 4 were wise men.
My 20, 13, 16, 41, 7 a king.
My 29, 17, 23, 26, 42, 18, 22, 5 a king's wife.
My 21, 36, 18, 14, 33, 34, 36, 21, 24 a man's name.
My 14, 20, 30, 1, 38 a servant of the church at Cenchrea.
My 39, 27, 8, 32, 28, 15, 37 a chamberlain of a city.
My 4, 31, 3, 19, 39 a proper name.
My whole is a verse in St. Matthew.

☞ Answer in two weeks. C. S.

CROSS-WORD ENIGMA.

My first is in bugle but not in horn,
My second is in grief but not in scorn;
My third is in bounce but not in throw,
My fourth is in eagle but not in crow;
My fifth is in seek but not in look,
My whole is the name of a good book.

ROMPING MINNIE.

☞ Answer in two weeks.

PUZZLER ANSWERS.—Sept. 2.

HISTORICAL ENIGMA.—"Religion on earth is joy in heaven.

HIDDEN FRUIT.—1, Currant; 2, Grape; 3, Fig; 4, Apple; 5, Cherry; 6, Plum; 7, Tomato; 8, Apricot; 9, Banana; 10, Berry; 11, Pear; 12, Raisin.

DOUBLE CROSS-WORD ENIGMA.—New York and St. Louis.

TRANSPOSED AVIARY.—1, Goldfinch; 2, Hummingbird; 3, Kingfisher; 4, Nightingale; 5, Starling; 6, Pigeon; 7, Falcon; 8, Swallow; 9, Pheasant; 10, Partridge.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

THE following is a graduated scale of prices for small clubs according to the reduced rates of subscription for the RURAL NEW-YORKER. This is done for the benefit of the small clubs in thinly-populated districts. Let each subscriber add two or three names to his own and remit for all at one time.

No.	Single Price.	Small Clubs.	No.	Single Price.	Small Clubs.
1	$2.50	$2 50	6	$15 00	$13 20
2	5 00	4 90	7	17 50	16 05

News of the Week.

HOME NEWS PARAGRAPHS.

HARVARD COLLEGE has received an anonymous gift of $12,375.69 for the use of the college.

Texas raises 800,000 bales of cotton this year.

It is stated that the Indians, who a year ago were sentenced to confinement in Florida for murders committed on the Plains, have since been intrusted with guard and sentry duty at the fort where they are kept, and have proved themselves most trustworthy and susceptible of drill and discipline.

The report of the Director of the Central Park Menagerie, in this city, has just been published. The total number of specimens exhibited during 1875, 1,060. During 1874 there were added to the specimens 222 mammals, 191 birds, and 79 reptiles; and during 1875, 254 mammals, 273 birds, and 27 reptiles. The number of animals living in the menagerie has steadily increased during the past three years, there being 455 mammals, birds, and reptiles in 1873, 550 in 1874, and 626 in 1875.

The session of the Forest Convention was opened by electing Hon. Alexander Wildin, Chairman, and George May Powell, Secretary. The subject of the relations of forests to commerce was discussed. At the second session resolutions were adopted relative to promoting forest literature and establishing a school of forestry, recommending action on forests by the Government, Chambers of Commerce and scientific societies, and that agricultural colleges establish forest professorships, and agricultural societies secure forest addresses at their annual meetings.

The various knitting mills in Troy have pretty much arranged their troubles with strikers, and will probably run without intermission during the fall and winter.

Texas has planted the true Egyptian rice, finds that it flourishes on prairie upland and yields ten times as much as any other variety; that the heads are larger and the grains heavier, darker and more easily obtained than the varieties now cultivated. The crop of American rice is steadily growing and will before long equal our own consumption.

The largest lantern ever made will soon be erected at Galley-head, on the coast of Cork. It will consume 1,600 feet of gas per hour, and the flashing light will be visible through the fogs. The power of the light will be equal to 2,000,000 candles.

New Haven on Friday shipped 15,000,000 cartridges to the Turkish government.

The Globe Hotel, one of the failures of the Philadelphia show, is to be removed to Cape May.

There are 300 journals of the German language published in this country.

A third form wire telegraph cable has been laid across the Straight of Canso, New Brunswick.

The latest information in regard to the pursuit of the Northfield, Minn., robbers is that their route was through the woods at Lake Elysium, Ind., and across the bridge toward Waterville. Squads of men were sent in various directions to head them off. A special train left St. Paul the evening of the 16th on the St. Paul and Sioux City road, carrying the Chief of Police and twenty-five or thirty picked men. A hundred men are surrounding the country in which the robbers are, and it does not seem possible for them to escape. Detective Hazen, in the employ of the American Express Company, who was sent here from Cincinnati, identifies the two dead robbers by photographs as Charley Pitts and Bill Chadwell. He says the light-haired man, wounded at Northfield, is undoubtedly Frank James. There is no doubt of this being the famous gang who operated in Missouri, and if any of the living members of it are lucky enough to escape they will doubtless give Minnesota a wide berth.

One span of the railroad bridge, 180 feet long, over the Tennessee River at Loudon, was blown down on 11th inst.

An insane woman tried twice to drown herself in Worthington, Md., and a dog in each instance drew her out of the water.

The Delaware River is lower than it has been for several years, and in some places is nearly fordable.

Boston and its suburbs received from Mystic Lake during the last year a daily average of 32,000,000 gallons of water, which is 5,000,000 gallons more than the daily supply of London, Eng.

Several prisoners in jail at Richmond, Ga., have published a card requesting their friends not to attempt a rescue.

A San Francisco man died of heart disease at the wedding of his daughter.

A crazy man was tied fast in a wagon for transportation to Blountville, Ky. He yelled so loudly that the frightened horses ran away, throwing out the two keepers and breaking an arm of each. Then the lunatic seized the reins, controlled the horses, drove alone to the asylum, and delivered himself up.

President Grant has issued his proclamation declaring that the Convention between the United States and the Hawaiian Islands having been duly ratified and proclaimed by both Governments, and the necessary legislation by Congress having been passed to carry the same into effect, and the ratification of the Convention having been exchanged as provided in Article VI., the Convention will take effect on the date thereof, Jan. 30, 1877.

In the town of Wellington, Conn., two young girls—Rosie Green, aged fourteen years, and her companion, Miss Shurtleff, aged seventeen years—took strychnine with suicidal intent. Miss Green died in four hours' and, just before her death, stated as her motive that no one cared for her; that her dead mother was calling her, and she was tired of life. Miss Shurtleff is alive, but still in danger. Two young men were present when the fatal dose was taken, and were urged to partake of it, but refused, although they thought the whole thing a joke.

The Newark, N. J., dog-pound, which opened on June 9th, at Commercial wharf, was closed on the 9th inst. The highest number received on any one day was 122, the opening day, and the lowest was 7. The total number received during the three months was 2,193, of which only 113 were redeemed. Of the redeemed several were taken out as many as three times. Of the whole number only one showed symptoms of hydrophobia. Over 2,000 were killed.

While the little daughter of Commanding Sergeant Riley, of the Sixth Sub-Precinct Police, Brooklyn, was playing with an ivory-handled fan, Saturday afternoon last, she swallowed a small piece of the handle and died from strangulation at 8 o'clock Saturday evening.

The first man who ascended the great South Dome in the Yosemite Valley, John Anderson by name, lives in a small house near the saddle of the dome. He is hard at work constructing a staircase of a thousand steps up the dome, and hopes in course of time to have an elevator running. He is also working on a model of a steam car to carry passengers up the almost perpendicular walls.

The appropriation for the preservation and repair of vessels of the navy having been reduced last session to $170,000, few ships heretofore laid up can be repaired this year as a consequence. A considerable portion of the amount must be expended in the care of vessels, purchase of stores, preservation of materials, etc. At present it is the intention of the department to repair the Benicia, Iroquois and Tuscarora at the Mare Island Navy Yard for service in the Pacific. The Wyoming will be fitted out at Washington for a schoolship at Annapolis, and, with the Ticonderoga or Wachusett, will be repaired at Boston for service on some of our foreign stations.

The camp meetings throughout New York State are much neglected this year by their regular visitors. Perhaps the Centennial has something to do with it.

In Cumberland Co., Pa., Charles Windowmaker was sentenced to the Eastern Penitentiary for twenty years, and William and Joseph Windowmaker, all brethren, to fifteen years. About two months ago the party entered the residence of William Abrams and wife, an aged couple, reputed to be worth nearly $100,000. The Windowmakers supposed there was a large amount in the house, but being unable to find any money they tortured Abrams and wife by severely burning their feet and other portions of their bodies to compel them to state where the money was secreted. Rather than be killed Abrams told them the location of about $70, all the money in the house, which they secured and soon after left.

Another brother, who served eight years in the South Carolina prison for manslaughter and two terms of four years each in Pennsylvania for highway robbery and horse stealing, is under arrest for stealing three horses.

A Chattanooga farmer's house was robbed. Next morning a stranger called and said that he was one of the robbers and he showed a locket. The farmer said that he valued the locket because it had been worn by a dear child. "Here it is," said the robber, visibly affected. "Let me make restitution. Here are $20 for your little son." He handed the farmer a counterfeit $50 bill and received $30 change.

Wild animals are getting thick in New England. A bear seven feet long was shot near the Twin Mountain House the other day, and a big panther is scaring the people of Springfield, Vt.

A young seal was shot at Middlebury, Vt., the other day, which the people believe escaped from Barnum's show.

The Oldtown Indians, near Bangor, Me., have a law requiring everybody in the town to be at their own home by 9 o'clock in the evening. One Indian was recently caught out at 10 o'clock at night and sent to jail for thirty days.

There is a cavern near Decorah, Iowa, named the Ice Cave. It is 200 feet deep. In summer the water which drips from the rocks freezes as it falls, while, what is most strange, in winter no ice forms in the cave, even that of summer disappearing.

A factory for the manufacture of sugar and sirup from watermelons has been established on Andros Island, California.

FOREIGN NOTES.

The *Standard's* Vienna special says the Grand Vizier will soon acquaint the foreign Ambassadors of the Turkish conditions of peace, the first point of which will be the new investiture of Prince Milan as the vassal of the Porte.

Reuter's dispatches from Belgrade state that the Ministers of War and the Interior are visiting the Army of the Drina, observing operations. If the war continues, immediate and important changes are expected.

A dispatch from Cairo to Reuter's Telegram Company says it is believed that the treaty of peace between Egypt and Abyssinia is signed.

A mass meeting at Dublin, Sept. 10, to protest against Bulgarian atrocities, became a demonstration against the English atrocities in 1798. One of the parading bands carried the American flag.

A report of the capture of Bill Tweed in Spain, is confirmed by London telegrams of the 10th inst. In response to a request for a repetition, Reuter's agent at Madrid reports verbatim the news of the arrest of Tweed, adding that the prisoners are closely guarded at Vigo by the military authorities. The First Secretary of the American Legation has requested the extradition of Tweed, and he is consequently to be handed over to the American authorities.

Reuter's telegram from Madrid states that the Minister of the Interior having recently ordered the removal of the placards, notices, etc., from the exterior of the Protestant schools and places of worship, the Protestant ministers have complained to the British legation, and intend to follow up the matter.

A Rome correspondent of the *Independence Belge* says that Cardinal Antonelli is growing infirm and peevish. He is much bent, and there is little left of his remarkable appearance but the fiery, large, black eyes. His cheeks have grown sallow and lank, and his face wears an expression of gloom and fretfulness which indicates his keen sorrow at the loss of political power.

A frightful tragedy has taken place at Finistere, in France. A man, seized with a sudden fit of madness, set fire to his house, after having barred the doors upon his wife and four children. The whole family perished, and when the remains were discovered they were reduced to cinders.

In a spiritual way the Pope has again called the attention of the Italian authorities to the existence of infamous resorts in the neighborhood of churches in Rome. The Pope's secretary acted in the matter through the Prefect of the Propoganda. That official received prompt notice from the Government authorities that the alleged evil would be immediately investigated. The result was the arrest of a large number of gamblers and harlots who held daily and nightly carousals in two houses situated near the Church of San Carlo Borromeo.

A curious discovery has been made in the convent of Santa Maria in Nuova at Rome, which formerly belonged to the Franciscan monks. It consists of three underground cells, accessible only through a hidden trap door, and where monks guilty of grave offences were, probably, put. In the first there is a little light, through an opening in the wall; the second is narrower and darker; the third is without a ray of light, and is a dismal hole. Sinister and mostly obliterated inscriptions cover the walls, and numerous instruments of torture, as well as human bones, were found.

Mme. Janin has left, in accordance with her husband's wishes, his extensive library to the French Academy. Cousin bequeathed his to the Sorbonne. In Janin's case, the books are, perhaps, not so much rare as splendidly bound; every author presented him with a copy of his work printed on superfine paper, and any old but valuable book Janin picked up on the stalls he at once dressed in a gorgeous cover. Good books were treasures, and merited equality in binding. Leon Say, the Minister of Finance, has not more than 200 volumes in his library; these are so richly bound as to represent 1,000 francs each. The late Ambroise Didot has left the most valuable classical library in any country owned by a private individual, and Sardou, the dramatist, follows next.

The most extraordinary balloon adventure on record has just happened to the aeronauts of the Alexandra Palace Company, London. Having attained a light of 8,000 feet, they three times crossed the Thames, and descended in a large meadow near Eltham, Kent. They were just letting off the gas when a large bull charged them, bellowing furiously. They threw the two last bags of sand out of the car, and barely escaped through the rising of the balloon. The bull scattered the contents of the sand bags over the ground, and his horns, becoming entangled with the grapnel rope, set the grapnel free, throwing one aeronaut out of the car through the jerk. Fortunately he succeeded in clutching the netting, and, with his companion's assistance, was hauled into the car before it had ascended many hundred feet. They then sailed away for a mile, and descended in another meadow.

A Canadian sportsman declares that the speckled trout in Ontario have been killed by warm water. The woods have been cut down and the sun shining upon the water from morning till night heats the streams. He asks the farmers to plant willow limbs along the water's edge to shade the brooks and give the trout a chance—to be caught by anglers.

A Moscow journal thinks Russia is better prepared for war than she was in 1853, giving as a reason that reform in government and society has awakened a feeling of citizenship among all her people, both high and low.

From the champagne country comes the wel-

come intelligence that, owing to uninterrupted hot and fine weather, and notwithstanding parasitical ravages in some vineyards, a first-rate harvest of the grape yielding the favorite sparkling wine is assured.

Work on the tunnel across the British Channel is to begin on the 1st of July, 1877. The tunneling machinery to be used can bore a drift nine feet in diameter across the Channel in two years at a cost of $4,000,000. Four years more and an additional outlay of $20,000,000 will complete the tunnel.

Mme. Dobrovolska, who shot at Prince Gortchakoff at Berne, is said to be a mad woman well known to the Russian embassy of Paris. The following particulars of the attack on the Prince are given in an English paper:—"On the 9th, at 6 in the evening, he was returning to his house, when a lady very elegantly dressed, fired at him with a revolver loaded with small shot. The Prince, who was not struck, turned toward her and himself disarmed her. He asked her what motive she had for such an attempt, and she stated that she was named Dobrovolska, and had causes of complaint against his Government. The Prince handed her over to the police and a judicial investigation has been commenced."

The Turkish Minister at Washington has received from his Government a long report on the Bulgarian outrages. It professes to give a true account of the Bulgarian rebellion and of the conduct of the troops who suppressed it. "It is not," it says, "to be denied, however, and unfortunately we must acknowledge it, that villages such as Otlouk-Keny, which were forcibly occupied, have been sacked by the peasant volunteers from the neighborhood."

INQUIRIES FOR ADVERTISERS.

[Owing to the many inquiries from subscribers concerning things that have a commercial value, and are offered for sale through the medium of newspaper advertising, we have deemed it for the best interest of all concerned, to classify our "Answers to Correspondents," so that each inquiry will appear under its appropriate head, either in "Inquiries for Advertisers," or "Answers to Correspondents." This, we believe, will enable advertisers to more effectually comprehend the wants of our subscribers, and will enable us to make our advertising columns what they should be—a true reflection of our readers' wants. This department will be edited carefully, it being our aim to use it in the interest of both advertisers and readers (and we shall not hesitate to give our reasons for excluding bad or doubtful advertisements) and such other matter as will be of legitimate interest. At the same time it must be understood that such inquiries as may appear must appeal to the advertiser himself for answer. The advertisement should answer the want and the want is indicative of its need.]

R. H. A., Bergen Co., N. J., wants Rouen Ducks and Game Bantams.

G. B. R., Niagara Co., N. Y., wants full-bred American Merino Sheep.

J. R. Y., Lehigh Co., Pa., wants Seckel and dwarf pear trees. We refer him to the nursery advertisements in this issue.

F. Y. G., Cattaraugus Co., N. Y., wants a portable saw-mill.

M. Y. H., Essex Co., Mass., wants a good farm of about 200 acres in Ohio.

S. Y., Delaware Co., N. Y., wants a good reliable food steamer.

X., Ashtabula Co., Ohio, wants a cheap hand corn-sheller.

F. B., Queens Co., N. Y., wants Conover's asparagus. Try the seedsmen advertising in this paper.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 9, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	80,300	Molasses	—
Whisky	3,051	Rice, bbls	237
Corn meal, bbls	4,018	Cut meats, pkgs	9,185
Corn meal, bags	610	Lard, pkgs	3,490
Wheat, bush	154,000	Tobacco, hhds	3,193
Corn, bush	1,150,035	do. pkgs	5,501
Oats, bush	96,700	Butter, pkgs	32,000
Rye, bush	45,850	Cheese, bxs	21,200
Malt, bush	50,800	Cotton, bales	5,660
Barley, bush	1,150	Rosin	12,936
Beans, bbls	5,400	Spts. turp., bbls	1,466
Grass seed, bush	7,841	Dried Fruits, pkgs	1,340
Beef, pkgs	1,000	Eggs, bbls	6,390
Wool, bales	2,125	Peanuts, bags	135
Hops, bales	653	Leather, sides	55,497
Pork, bbls	700	Sugar, hhds	—
Tallow	1,200	Oil cake	1,762

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEESWAX.—There is a very slow business; Western quoted at 30½@31c., and Southern at 31@31½c. Since Jan. 1st., 55,352; same time last year, 57,651.

BEANS AND PEAS.—Exports of beans past week, 652 bbls.; since Jan. 1st, 43,529 do.; same time last year, 20,992 do. Exports of peas past week, 663 bu.; since Jan. 1st, 474,756 do.; same time last year, 235,792. The recent turn of prices for mediums, restricted buying, and with the light jobbing demand now current the market has lost its firmness, but is steady for what trade is doing. Marrows are higher with holders. Late Havana advices will not warrant exportation at present quotations. New mediums have sold to arrive at $1.30; new marrows are not marketable; shippers prefer to wait until they dry off a week or two. This fact gives prime old some additional firmness. Kidneys of all grades are scarce. Other beans quiet.

Canadian peas continue quiet, it is likely important buyers will await new crops. Southern B. E. Peas expected next week, no named price as yet. Green peas quiet, the stock of old has been pretty well sorted over, and new are waited for.

Beans—Prime pea, $1.40@1.45; fair to good, $1.20@$1.30; prime mediums, $1.20@1.25; fair to good, $1@1.10; prime marrows, $1.85@1.90; fair to good, $1.65@1.70; prime white kin., $1.70@1.75; other, 1.25@1.50; prime red kidney, $1.50@1.55; other, $1.25@1.45; Lima (Cal.) $2.75@3. Black beans, $3.75@4.00. Canadian peas, bulk and bond, 95@97c.; free bbls, $1.14. Green peas, $1.15; split do. $6.

BUTTER.—The market has advanced for both State and Western, table grades and under qualities are quoted full, supported by the prolonged export demand. We could use more fine State than is arriving, but it would seem as if dairymen put too much stress upon the high rule of late, and keep stock out of distributors reach. So far as future prices are concerned State folks should take a hint from their Western competitors and give a fair release of stock. The latter are making the most of the export outlet and as the dependence of local buyers is so exclusively upon State, holders turn stock while paying prices rule. The prospectively diminished fall crops of course prevents dairymen from hurry to part with stock; still when famine prices have to be adopted, they produce a dangerous lull which has often worked disastrously in approximating by-gone periods. Choice pails have been quoted at 35c. all the week. Welsh tubs are not giving satisfaction this season. They are always wanted for Eastern use. The Welsh package is also the favorite one for foreign use. Canada having for many previous years given it popularity abroad. Exports of butter past week, 17,025 packages.

We quote:—Choice pails, 32@33c.; prime, 29@28c.; poor to good, 18@25c.; creamery pails, choice, 33@35c.; good, 28@32c.; sweet cream pails, 27@34c. State firkins, choice, 29@30c.; fair to good, 24@27c.; do. half firkin tubs, choice, 30@31c.; fair to prime, 26@29c.; do. Welsh tubs, choice, 27@28c.; other, 23@25c.; Western creamery, choice, 31@31c.; other, 28@30c.; do. firkins, best, 20@21c.; other, (5@18c.; dairy tubs, choice, 21@25c.; other, 16@19c.; factory choice, 21@23c.; other, 15@17c.

State dairies quotable at 27@30c., though few are in. Most of the long lines are yet made up of farm lots.

CHEESE.—With the interior sales showing a marked advance this week, holders views were immediately strengthened in sympathy, and with the English market going up subsequently, the prices were fully sustained on sales. Towards the close quite an active business was in progress, and a strong market at an advance of about one cent on last week's figures.

Fancy factory, 11½@11¾c.; fine, 11¼c.; good and prime, 10½@11c.; fair, 9@10c.; do. half-skimmed, 7@8c.; do. skimmed, 4½@6½c. State farm dairy, fancy, 10¾@10¾c.; good to prime, 9@10c.; fair and good, 8@9c. Western factory, good and prime, 8½@9½c.; fair lots, 7½@8½c.; do. cheddar, choice, 10@10½c.; do. flat, choice, 10@10½c. Exports past week, 61,326 boxes.

COTTON.—There has been very slight changes in prices. The feeling is a trifle stronger through the reports from the South of injury to the crop by worms.

The latest quotations are:—September, 11 29-32@11⅝; October, 11⅝@11 17-32c.; November, 11 15-32@11⅝c.; December, 11⅞c.; January, 11 29-32@11⅝c.; February, 11 25-32@11 13-16c.; March, 11 31-32@12c.; April, 12⅛@12 3-16c.; May, 12 6-16@12 11-32c.; June, 12 15-32@@12¾c.; July, 12¾@12 21-32c.; August, 12⅝@12 25-32c.

DRIED FRUITS.—Exporters have taken small lots of Southern quarters at inside prices, with 6@6½c. paid for repicked; very good sliced have been sold at 9¼c. Peeled peaches are hard to sell. Blackberries are selling up to 8c. and cherries at 16c.

Apples—State, sliced, 7@7¾c.; do., quarters, 7@7¾c.; southern sliced, now, 6@7c.; choice do. at 8@8½c.; do., new quarters at 5@6c. Blackberries, 8c. Peeled peaches, new, nominally 13@15c., as to quality; unpeeled peaches, new, nominal. Plums at 13@15c. Raspberries, 21@25c. Cherries, 16c.

EGGS have at last struck a movement that has a seasonable appearance. Each day since our last has shown a firm feeling and no seller has been sufficiently supplied.

Near points, 23@25c.; State and Penn., 22@23c.; Western, prime, 22c.; do. other, 21@21½c.; Canadian, 21@22c.

ESSENTIAL OILS.—New crop as yet, has not affected our lately revised quotations.

Oil peppermint, glass, $3.75; do. tin, $2.90; spearmint, glass, $3.50; do. tin, $2.75; wintergreen, $2.80; sassafras 35c.

FEATHERS nominal; prime live geese, 50@55c.; mixed, 35@60c.

FLOUR.—The advices from the other side have been more encouraging and a liberal business has been in progress, with prices higher and strong.

For poor to very choice superfine State, $3.80@4.35; $4.70@4.85 for very common to fair extra do.; $4.90@4.95 for good extra do.; $5.00@5.30 for fancy do., and $5.35@5.60 for very choice extra; $3.80@4.35 for superfine Michigan Indiana, Iowa, &c.; $4.70@4.85 for shipping extra do., the inside price for inferior, and $4.90@5.30 for choice to very fancy extra do.; good to choice white wheat extras at $5.35@6.50; fancy do. $6.55@7.50; winter wheat, good to choice family city mill extras, $6.00@7.50, round-hoop Ohio, $4.75@4.90, and trade brands of do. at $4.95@6.75; St. Louis, $4.95@6.25 for common to fair extra, and $6.30@8.50 for good to very choice; Minnesota "straight" at $5.50@7.25, and patent at $6.50@8.50; unsound stock at from $2.50@5.50; city mill extra for West Indies at $5.80@5.90; do. English brands, $4.75@4.85; do. trade and family brands, $6.25@8.50; No. 2 at $2.20@3.50. Corn meal—Yellow Western, Jersey and Pennsylvania, $2.60@2.90; Brandywine, $3.25@3.30, and buy at 92½c.@$1 for Western.

FRESH FRUITS.—There is a steadier feeling in pears and apples, peaches now depending upon a special demand. Fancy New Jersey peaches exceed Delaware in price; in fact, Delaware is running out. Plums are a little stiffer. Grapes are in heavy supply and sellers cannot put them low enough to close out from day to day. An invoice of California Muscat arrived in good order, but sold as low as 12½c. ₩ lb. Reports from New Jersey cranberry crops are more encouraging; the east will have only a light yield. Bartlett pears are not showing the quality of former seasons.

Apples, State, prime, ₩ bbl., $1.50@2; river, $1.25@1.50; common, 75c.@$1. Peaches, fancy, ₩ basket, 75; good, $1.25@1.50; small, 50@75c. Pears, Bartletts, ₩ bbl., $4@7.50; Seckel, $2.50@5.50; Louise Bonne and Flemish Beauty, $3@5; cooking, $1.50@2; California, boxes, $3.50@4. Plums, choice, table, ₩ bbl., $10; common to good preserves, $6.50@9; California, crates, $2.50@3. Grapes, Delaware, boxes, ₩ lb., 9@11c.; loose, 7@9c.; Concord, boxes, 5@7c.; loose, 3@5c. Nutmeg melons, best, ₩ bbl., $2.50@3; common, $1@2. Watermelons, ₩ 100, $5@20. Virginia peanuts, prime, $1.50@1.60; other, $1@1.40.

GRAIN.—For wheat there has been a better inquiry within a day or two, from exporters not sufficient life to give any buoyancy; latest sales were of ungraded spring at $1.05; common No. 2 Chicago spring, in store, at $1.05; No. 1 Minnesota spring, in store, at $1.15; new amber Delaware at $1.24@1.25; amber Michigan, part to arrive, at $1.25@1.26; extra white Milwaukee spring at $1.09½; car lot of amber Jersey, very choice, at $1.33. For new No. 2 Chicago spring to arrive $1.10 is bid, and for No. 1 Shoboygan spring $1.13 bid. Rye active at 74½@75c.; for western and 85 for State.

For barley 8d is bid for No. 2 Chicago, 92½@95; bid for six-rowed state, and $1@1.05; asked. Corn has been active on export orders; sales at 54@55c. for graded and ungraded steamer mixed, with 72,000 bushels mixed sold at 55c., in store; 54½@57c. for ungraded mixed, including prime sail at 56c.; 56½@57c. for Kansas mixed; very choice high mixed nearly yellow, at 57c.; steamer white at 58c.; steamer yellow at 57c.; western yellow at 54@57c.; southern yellow from dock at 56c.; New York white, 55c.; New York "no grade," by sample, at 52½@53c.

Oats are in light supply and much larger; latest sales at 38@46c. for mixed western and State, and 41@46c. for white do., No. 2 Chicago, in store, at 40@44c.; very choice, in store, at 45c.; mixed State at 46c.; white western, in store, 44@48c.; mixed western, 40@43c.; new white State at 48@50c.; new mixed western at 37@44c.

HAY AND STRAW.—Receipts some moderate, and demand fairly active at rather steadier prices.

Bale hay is quoted:—Shipping, 80c.; retail qualities 75@95c.; clover, 55@60c.; salt, 55@60c. Straw is quoted at 70@75c. for long rye; 50@55c. for short rye; 50@90c. for oat.

HIGHWINES.—Bring $1.11 per gallon.

HONEY.—California has a large crop, and there is a good supply of State. It is too early for any price to be put upon new comb. There is quite a remnant of old quoted at 15@20c. for white and 8@10c. for dark.

HOPS.—There has been but little done this week, but owing to moderate stocks of desirable lots, the new season opens very favorably to growers. The German crop is short, and there will be the additional requirements from this source. It is the impression that shippers will act cautiously at first, sending forward small lots only. The yield of New York State and Wisconsin has fallen considerably short of last year, but in California and the Territories there has been a large increase, so that it is safe to say the yield this year stands 140,000 bales against 150,000 last year.

N. Y. State, 20@23c.; Yearlings, 10@20c.; Olds, all growths, 4@8c.

POULTRY AND GAME.—The live poultry market is only steady, but prices have averaged better for fowls, and turkeys begin to be wanted. We quote:

Spring chickens, near-by, ₩ lb., 15@16c.; do. Western, 14@15c.

Fowls, N. J., ₩ lb 15@17c.; do. Western, 15@16c. Roosters, 8@10c.; Turkeys, N. J. 16@18c.; do. Western, 15@16c.; Ducks, N. J., pair, 75c.@$1.12; do. Western, 65@75c.; Geese, N. J., $2.00@2 50; do. Western, $1.37@1.75.

Dressed poultry in good demand for the season; all lots still have to be iced. Turkeys higher. We quote:

Dry-picked chickens, 18@20c.; scalded, 15@17c.; dry-picked fowls, 17@19c.; scalded, 15@18c.; turkeys, 16@20c.

Game is in good demand for the new sorts. Venison will be in some weeks earlier if the weather admits, the law having given it an extra month at the West. We quote:

Partridges, ₩ pair, 75c.@$1; grouse, do., 90c.@$1; woodcock, do., 65@85c. A few wild ducks low.

PROVISIONS.—Hog products have been in good export demand and favor the seller. Mess pork quoted at $17.15 for spot lots, $15.80 for December. Bacon, long, clear, 9¾@9¾c.; short do., 9¾c. Western steam lard at $10.85 for spot; October, $10.75; November, $10.10; December, $9.82. Steamine at 12½c. for prime Western. Barreled lots are quoted: $8@10 for plain mess, $10@11 for extra mess, and $11@12 for packet, the outside prices for small lots choice. Tierced quoted nominal for prime mess and India mess. City extra India mess at $20. Beef hams at $26 for choice Western.

TOBACCO has been in very good export demand and strong in price.

KENTUCKY LEAF—NEW CROP.

	Light.	Heavy.

Good lugs	6¾@ 8	8 @ 9
Low leaf	8½@10	9½@11
Medium leaf	13 @11	14½@15½
Good leaf	15 @16	16 @17½
Fine leaf	16 @18	17 @20

SEEDLEAF—CROP OF 1875.

New England fine seconds	12½@14
Fine fillers	6 @ 7½
Seconds and fillers, shipping	5½@ 7
Pennsylvania assorted lots	11 @25
Ohio assorted lots	5 @ 6½
Wisconsin assorted lots	3 @ 5

SUNDRIES.—Ginseng, ₩ lb., Southern, $1.15@1.30; Seneca root, 75c. Cider, ordinary to refined, 14@18c. ₩ gal.; cider vinegar, 18@25c. Sheep skins clipped, 30@35c.; do. unclipped, 50c.@$1; lamb skins, 60@65c.

VEGETABLES.—Potatoes are doing better, buyers preferring to pay more for nice-looking State than for the dark-colored Western in badly-filled barrels. It is not likely that there will be many further shipments of early Western. Tomatoes doing well. Onions scarce. Market only fairly active. Cheap fruit calls off some of the trade.

Prime potatoes, bbl., $2.75@3; fair, $2@2.50; sweet, $2.75@3. Corn, ₩ 100, $1@1.25. Tomatoes, ₩ bush, 75c.@$1. Marrow squash, ₩ bbl., 75c.@$1. Cabbages, ₩ 100, $5@8. Russia turnips, bbl., $1@1.25. Egg plants, ₩ 100, $7@9. Wax beans, ₩ bag, $1@1.25; Lima, 75c.@$1; shelled do., bush, $3. Cauliflower, bbl., $13@6. Yellow onions, ₩ bbl., $2; red, $1.50@1.62; white, $2.50@3.25.

WOOL.—There is an active and very strong market at a further advance. Manufacturers and speculators seem disposed to take advantage of current prices and stock-up freely. For XX Ohio fleeces 43c. is bid and up to 45c. asked, and for X do. 41c. is bid, with X and above Michigan fleeces sold at 36c.

ROCHESTER, Sept. 9.—Flour market active; spring, $6.50; amber winter, $6.75; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.00. Wheat lower: Milwaukee club, $1.09@1.18; amber winter, $1.03@1.05; white winter, $1.05@1.15. Oats, nominal at 30@33c. Corn quiet at 58@62c. Corn meal, $1.25@1.30. Butter, 22@24c. Cheese, 9@11c. Eggs, 15@16c. Lard, 11½@12½c. Apples, bu., 40@75c. Potatoes, bu., 60@75c. Beans, ₩ bu., 70@90c. Mess pork, $17.15. Wool, 20@25c. Hay, $8@11. Straw, $6@8. Timothy seed, $2.75@3.50; clover, $9.25@10. Mill feed strong at $16 for shorts, $18 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 40c. ₩ bbl.; to New York, 30c.; to Albany, 25c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Sept. 9, 1876.

The general tone of the Little Falls market for the week ending Sept. 9th, was somewhat improved. The cool weather which has been prevailing throughout Herkimer Co., for the past few weeks has helped materially to bring about this result. Dairymen feel, now that all their July cheese which had suffered from the effects of the "heated term" are disposed of, that the quality of their goods is not only better, but that there is scarcely any risk in holding at the factory. Consequently factorymen felt easy and were not over anxious to sell, unless at a margin of at least ⅛ of a cent more than was paid a week ago. This they received, about 5,700 boxes having been sold.

The following is a list of transactions: 5 lots on commission; 1 at 10c.; 2 at 10½c.; 1 at 10¾c.; 25 at 10¾c.; 25 at 10¾c.; 27 at 11c. and 1 on private terms; making the range of prices 10@11c., and the average price paid 10⅞c.

There were but few farm cheese offered, only 300 boxes having been delivered. These sold for from 8½@10½c.

We have advice from abroad to the third week in August. Our London correspondent says: Cheese, more especially American, sells well; extra fine scarce; some useful sold as low as 40s., sales large. Quotations are as follows: American, extra fine, 24s.; fine, 70@52s.; good, 46@48s.; secondary, 40@44s. The other descriptions of cheese sell as follows: English Cheddar, 76@82s.; Wiltshire, double, 63@72s.; Cheshire, medium, 50@58s.; fine, 66@70s.; Scotch, 56@61s.

The heat tells seriously on butter, cutting off supplies, and to some extent lessening consumption. Prices steadily advance, and now look as if this article must rule high. Supply of Margarin not equal to demand. Corks, 127@133s.; Limericks, 128s.; Dorsets, 150s.; Jersey, 132@134s.; Friesland, 136@140s.; Normandy, 120@150s.; American and Canadian, 90@$1.00

Oleomargarine or artificial butter from 100 to 112s.

LIVE STOCK MARKETS.

NEW YORK, Sept. 9, 1876.

RECEIPTS OF LIVE STOCK.

Hunsimus Cove	5,900	00	000	9,357	8,229
Totals this week	9,650	16	2,061	20,579	19,002
" last week	8,815	36	2,418	30,131	18,887

BEEVES.—Trade opened on Monday last on a moderate run and was a fraction ₩ lb. better than the closing rates of the previous week on good and fair quality steers, but slow at former rates for inferior quality cattle. Prices ranged from 7¾@10¾c. ₩ lb., with a few selected load at 10¾@11c., these latter being disposed of at retail; weights, 5¼@9½c. The markets closed firm. Wednesday, trade firm, at 8@10½c.; weights, 5@9¾ cwt., Thursday, as usual, trade small at 9@10¾c.; weights, 5¾@8½ cwt. Friday, the markets closed fair at 8@10¾c.; weights, 6@9¾ cwt. From 56@57 lbs., net, have been allowed; general sales on 56 lbs. net. Spanish herds, direct from the Plains, sold at 7¾@8½c. ₩ lb.; grass-fed native steers, 8@9c.; part corn-fed do., 9¾@10c.; grade do., 10¾@11c., including a few selected head sold at retail. Nearly 1,000 head of beeves were slaughtered and forwarded, during this past week, to the London market.

MILCH COWS.—Trade still slow on extremely light arrivals. Dealers declined to furnish quotations.

VEALS AND CALVES.—Coarse quality calves, part grass-fed and part buttermilk-fed, sold at 3½@6¼c. ₩ lb., also at $6@11 ₩ head. Smooth quality veals in fair demand at 7@9¾c. ₩ lb. State veals at 8@11c.; Jersey do., 8¾@9¾c.; Pennsylvania do., 7¾@8¾c. State calves sold at 3½@6¾c.

SHEEP AND LAMBS.—On Monday forenoon trade opened firm in sheep and slightly improved in lambs. The quality of the flocks was from coarse to good. Sheep sold at 4@6¾c. ₩ lb.; lambs, 6@7¾c. ₩ lb. Wednesday, trade fair; sheep, 4@6c.; lambs, 6@7¾c. Thursday, sales few; sheep, 4¾@5¾c.; lambs, 5¾@7¼c. Friday, the markets closed dull; sheep, 4¾@5¾c.; lambs, 5@6¾c. State sheep, bucks included, 4@5¾c.; Canada do., 4@5c.; Kentucky do., 4@5¾c.; Ohio do., 4¾@5¾c.; Pennsylvania do., 4¾@5¾c. Jersey lambs, 6¾@7¾c.; Virginia, 5¾@6¼c.; Canada, 6@6¾c.; Kentucky, 5@6¾c.

HOGS.—Trade very slow; 47 rough State hogs, live weight, 1,516 lbs., sold at 6¾c. ₩ lb.; 13 do., 3,000 lbs., 6¾c.; 123 Ohio hogs, quality smooth, 23,830 lbs., 6¾c. City dressed extremely slow on a light run and rates; prices, 7¾@8¾c., all weight included.

HORSE MARKET.—City trade steady, but slow for inferior quality horses. Light-priced animals hold on sale. Twenty-one head, poor quality, light harness horses sold at $35@70; 32 do., $50@97 ₩ head; 19 ordinary quality do., $110@205 ₩ head; 17 coarse quality heavy draft do., $115@210 ₩ head; 2 pairs family carriage horses, $220@230 ₩ pair; 16 roadsters, with fair trotting action, not warranted sound, sold at $255@325 ₩ head; 3 trotters, not warranted sound, $300@475 ₩ head; 2 pair stylish carriage horses, aged, $500@750 ₩ pair; 2 saddle horses, quality poor, $200@250 ₩ head.

AMONG all the races, the English (says Lowell) has ever shown itself more keenly alive to the fear of making itself ridiculous; and among all, none has produced so many humorists.

THE King and Crown Prince of Sweden would have been killed the other day if they had not jumped out of the carriage, which was thrown over a few minutes later by their runaway horses.

CAPT. STILES T. STANTON, whom most of our readers know so well as the popular humorist of the Norwich (Ct.) Bulletin, is spending his vacation at the Centennial in the military service of his State.

A THIEF in a tobacconist shop in Greenock, Scotland, left his false teeth lying on the counter in his night raid for segars, pipes and tobacco. The plate was given to the police, and the thief was arrested.

A RUSSIAN count has won the heart and hand of one of the belles of Quaker City, and November will witness the wedding. The parties met by chance in the usual way, and immediately fixed upon the wedding day.

THE Norwich Bulletin says:—"A good deal of disappointment was felt recently over a report that a spotted adder could be seen on Shetucket Street, as it turned out to be nothing but a bank clerk with the measles."

E. PESHINE SMITH, the legal adviser of the Japanese Foreign Office during the past six years, has returned to this country by the City of Peking. He received distinguished marks of attention on taking his leave.

THE CZAR, recently addressing the officers of the Paulowsky Guards, said he had been able hitherto to spare the blood of his soldiers, but the time might soon come when he should have to call upon their loyalty and valor.

MISS TORU DUTT is a young Hindoo lady who has just published a book of translations of French verse into English, and the critics praise it and call it "an important landmark in the history of the progress of culture."

A PARTY of 300 good cooks and 500 house girls, all English servants, visiting the Centennial, have been induced to settle in Richmond, Va., where steady employment is guaranteed.

THE body of the author of "Life Let Us Cherish," Hans George Nagell, who died about forty years ago, was exhumed on the 13th of August, and placed under the monument erected to his honor on the high promenade in Zurich, Switzerland.

SECRETARY ROBESON is going to Port Royal on the steamer Dispatch about Oct. 1. Distinguished guests will accompany him, and they are all to gaze upon the naval review there, which an awe-struck paragrapher says will be "magnificent."

AN Atlanta man walked around all day recently with a grasshopper in his ear. When his wife discovered it he said he had been hearing peculiar noises all day, but thought a new steam saw-mill had begun operation somewhere in the neighborhood.

THERE is one committee at the Centennial Exposition that has not had a vacancy since the opening. It is the jurors on wines, and they have sampled over 800 different varieties. Whines have been heard from nearly every committee but this one.

JOHN B. GOUGH, the eminent temperance lecturer, has in his possession four large volumes wherein are written the signatures of 140,000 persons to the pledge of total abstinence, obtained by the personal exertions of Mr. Gough. Does he know how many have kept it?

A NEPHEW of Mr. Bagges, in explaining the mysteries of a tea-kettle, describes the benefits of the application of steam to useful purposes. "For all which," remarked Mr. Bagges, "we have principally to thank—what was his name?" "Watt was his name, I believe, uncle," replied the boy.

VICTOR EMANUEL is an early riser, generally getting up at 5 o'clock in the morning, when he takes a cup of black coffee and a stroll in the garden. At 8 on Thursdays and Sundays he presides over the Council of Ministers, then he grants audiences, and then breakfasts lightly, his "serious repast" being supper.

A LIVELY pupil at a seminary asked the preceptress for permission to drive out with a gentleman. "You know the regulations of the institution," was the answer. "Is he your father?" "No." "Is he your brother?" "Are you engaged to him?" "No, but I expect to be before I get back." That answer carried the day.

IN the court room; a lawyer to his client: "I'm sorry, poor fellow, but notwithstanding my eloquence you have been sentenced to prison for three months." "Oh, don't let that worry you," was the answer; "I am not sorry. In the neighborhood where I live they will think I have gone to the country, and that will give me social status."

AN Arkansas coroner, having occasion to investigate the cause of a man's death lately, charged the jury that they were to ascertain whether "the man came to his death by accident, by incidence, or by the incendiary." The jury returned that "he came to his death by lucidence, the bowie-knife having incidentally touched a vital part."

BY request of prominent citizens, Prof. Huxley delivered a lecture at Nashville, Tenn. His remarks were a brief rehearsal of his well-known views on creation, applying them directly to Tennessee. The lecture lasted one hour, and was listened to by all the leading theologians of the city, among whom it created a great stir. He is advertised to lecture in this city.

SWEET is childhood—childhood's over,
Kiss and part.
Sweet is youth; but youth's a rover—
So's my heart.
Sweet is rest; but all my showing
Toil is nigh.
We must go. Alas! the going,
Say, "Good-by." [*Jean Ingelow.*

THE lady who has the smallest feet in America is the wife of a cousin of Sing Lee, proprietor of a San Francisco wash-house. Her foot is 2¾ inches long, 2 inches broad in the middle, and 1 inch at the toes. She wears white satin stockings and blue satin slippers embroidered in silver. A correspondent of the Louisville Courier Journal carries a tape measure and has had her foot in his lap.

THE death of Gen. William H. Richardson, long one of the most prominent citizens of Virginia, was followed but a few hours after that of a beloved daughter, and the two were buried on the same day. He was an officer in the war of 1812, the first Secretary of the Commonwealth of Virginia, and to his exertions the formation of the State library and the State Agricultural Society were mainly due.

"CONSIDERING that the mosquitoes are making their fall raids, and are particularly lively just now, my dear," said Jones to his wife, "don't you think it would be a good idea to bring the baby's crib into our room? We might divert the attention of the voracious insects a little from ourselves. I hate to be broken of my rest, and baby can sleep all day, you know." Mrs. Jones went in search of the tongs at once.

THIS is how M. Lacratelle received, on a recent occasion, his severe injuries: The member from the Saone-et-Loire was passing along a street where a ruined house was in process of demolition. A workman was stationed on the sidewalk to warn passers of the danger.

"To the Right! To the Right!" he cried.

"Never!" said Mr. Lacratelle, proudly; "I belong to the Left;" and, going resolutely on his way, a piece of the cornice struck him on the head.

Implements and Machinery.

Centennial Year of American Independence,

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you samples of the Celebrated Watches, manufactured by our countrymen, the MESSRS. BOREL & COURVOISIER of Neuchatel. These Watches are favorably known for INSPECTION and EXHIBITION, sold by our local agents in almost throughout the U. S., having been every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, fine Ruby Jeweled, set in Chaton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

QUINCHE & KRUGLER,
SALESROOM: 15 MAIDEN LANE, N. Y., Up Stairs.
Only Wholesale Agents for the Manufacturers. Jewelers wanted to act as Agents.

FREE TRANSPORTATION
to the lands furnished purchasers. For Circulars, guides, maps, etc., address
A. L. DEANE, Land Commissioner, St. Louis.

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

L. G.—The scarlet Maple is *Acer rubrum*—it is not the Blood Maple for which five times the price is asked.

E. T. J., Des Moines, Iowa.—Will the botanical editor of the RURAL please give the proper name of the inclosed flower, cut from a vine that grows and looks like a bean? ANS.—*Apios tuberosa.*—Ground Nut, Wild Bean. A perennial herb, bearing upon its roots tubers which are edible, and which would very likely be cultivated were it not for the potato.

Observer, Syracuse.—The mucous membrane lines the stomach as well as the mouth and nostrils, and a very powerful sympathy exists between its remotest parts. It is thus, to answer your question, that the appearance of the tongue affords some knowledge as to the condition of the stomach. This mucous membrane is connected at the several openings of the body with the true external skin. Hence, when chilled, catarrhs are caused or aggravated.

T. E. Howard, Geneseo, N. Y.—I would like to know the best time of the year for transplanting Elm trees desired for shade. ANS.—Either fall or spring, it matters little which for the Elm.

2. The size of the trees I wish are from five to eight inches in diameter at the base, or a foot above the roots. Can such trees be transplanted successfully? ANS.—Yes, with care.

3. Would you consider the upland Elm the best for such purpose? ANS.—We should consider it as good as any.

4. Would it be best to select trees from the woods or those standing out alone? ANS.—If the size were the same, those standing alone.

5. Should they necessarily be trimmed down much? ANS.—This depends entirely upon the degree of injury to the roots.

6. Is there any rule for trimming branches in proportion to the length of roots taken up? ANS.—Yes, as a rule they should be cut back in the proportion of the injury to the roots. But the minimum of this rule may be applied to the Elm.

7. Should they necessarily be set by the point of the compass as they originally stood? ANS.—Not at all.

If you will give the full particulars in respect to the whole process of transplanting such sized trees, you will confer a favor upon me and, perhaps, upon other readers.

Remarks.—The American White or Weeping Elm (*Ulmus Americana*) bears transplanting well—but the size you mention (five to eight inches) is so large that in removal, unless much time and care were taken, the roots would be so mutilated as to render its growth very slow for several years. Probably smaller trees—say three inches in diameter—would form larger and finer specimens at the end of four years. The best way to transplant trees so large is to dig a trench about them one year and remove the next. This may be accomplished more easily with the Elm, since it has no great depth of tap root.

Dig the hole wide and deep, and fill with rich soil.

H. C. B.—We think there is a fortune in the discovery of some means of exterminating ants in closets. Try the following, which is used in England: Two pounds of alum to be dissolved in three or four quarts of water, letting it stand on the fire until the alum is all dissolved; then apply it with a brush, while nearly boiling, to every point and crevice in closets, pantry, shelves and the like. Brush the crevices in the floor of the skirting or mop-boards if there is any suspicion that they harbor ants.

Y.—It would seem that there are well authenticated cases of spontaneous combustion. Drunkards have constituted the greater share, and we wish it were more frequently the punishment of drinking to excess—that curse upon human life. Then perhaps, with so startling a warning before their eyes, young men would think twice before venturing upon this enticing though inevitable road to ruin. It is supposed that intoxicating liquors tend towards an abnormal accumulation of phosphorus in the system.

T. C. D.—In my peach orchard, two years planted, many trees have died the past spring, and others are on the decline. The roots look as though they had been scalded. (1.) What could have been the cause? (2.) Could they have been injured before planting? or did the shovelful of unleached ashes put around the roots injure them? (3.) What is the difference between the bunch worm found around the peach roots and what is called "the borer." (4) Would it be be best to plow the said orchard, which is now in stubble, this fall or next spring, as I intend to cultivate the land next summer? ANSWER. (1.) We cannot say positively. (2.) Yes, trees are frequently injured by permitting the roots to become dry before planting. But we do not think the ashes could have injured them unless they were placed directly on the roots at the time of transplanting. It is more than likely that the peach tree borer is at work in the stems, but you should be able to determine this by the appearance of peach gum exuding from the wounds made by this pest. (3.) We never heard of such a thing as "bunch worm" attacking peach trees. Please explain further in regard to this insect. The true peach borer is the larva of a small moth which lays her eggs at the base of the stem, near the roots. As the grub bores into the bark and wood it pushes its excrement out of the hole thus made, and gum usually exudes more or less from the wound, and either is considered a pretty sure sign of the presence of borers. (4.) You will gain nothing in the way of killing insects or benefiting the trees by plowing this fall instead of next spring, but if the weeds and grass are kept away from around the stems of the trees all summer it will be a benefit in the way of growth, besides, in a measure, prevent the attack of the peach-tree borer.

W. H. Olin.—Accompanying this I send you some branches from apple trees containing the larva of some insect or beetle that is, so far as I know, a new enemy of the apple. You will notice in Nos. 1 and 11 that the larva entered by a hole through a little side branch, and penetrated down the wood a little way, and cut the wood entirely away, leaving it hanging only by the bark, and then proceeds to cut a channel up the wood. In No. 3 it looks as though it had penetrated through a green branch from the under side. In No. 4 it is cut off at both ends by the worm (perhaps there were two, but if so the other had failed, for there was no worm in the part above this). Is it a dangerous enemy?

I do not think it has anything to do with the blight that is so prevalent among apple, pear and quince trees this season, for that does not look or act like it. That seems mainly confined to smaller branches, and I cannot find any worms or holes about it. ANS.—There are several species of beetles, the larvæ of which cut branches from various kinds of trees in exactly the same manner as the specimens sent.

The well-known and common oak pruner, *Elaphidion parallelum, Newm*, a long, slender beetle, with quite conspicuous antennæ. The body of this beetle is about three-quarters of an inch long, and not more than an eighth in diameter. The female deposits her eggs upon the small branches of various kinds of trees, but appears to prefer the oak. The eggs hatch and the grubs penetrate to the very heart of the wood, feeding upon the pith for a few weeks, then they proceed to cut off the branch for the purpose, it would seem, of letting themselves down to the ground. They frequently cut off branches an inch in diameter, and we have always observed that the little grubs remain in the part cut off, and not in the stump or portion attached to the tree. We have bred hundreds of the beetles out of the fallen branches, as they remain concealed therein until their transformation is complete, coming forth the next spring. We do not know of any preventive further than to collect the branches containing the grubs and burning them.

J. W. M. and M. J. M., Oregon, Mo.—Accept our best thanks.

Paradise Station.—Linseed oil has been recommended for pear blight and some alleged remarkable cures have been effected by its use. A Mr. WESCOTT, by cutting through the inner bark and sap-wood, found that they were black and dead from blight. He washed the diseased parts thoroughly with linseed oil and the next spring the tree leafed out, and upon cutting into the diseased parts, he found that a new inner bark had grown.

As a tree grows by yearly depositions from the cambium layer, a part forming new sap-wood (alburnum) and a part forming new inner bark (liber), it is difficult to see how a growth of bark beneath the sap-wood could have taken place. But aside from this statement, others have highly recommended the use of linseed oil for pear blight.

Inquirer.—There is a pump in quite popular use that has one pipe driven down to spring water and another connected with the cistern. Both of these connect with a main pipe in the kitchen, so that by merely turning a crank either spring or well water may be used at pleasure.

2. The sides of the cesspool may be cemented if you choose and the bottom left uncemented. But we have found that the constant accumulation of grease will, after a year or so, prevent the passage of slop-water to an extent that necessitates the cleaning out of the cesspool from time to time. If you can connect it by 4-inch earthen pipe so that it will pass away, you will not have occasion to regret the extra expense.

Trees, Seeds, Plants, &c.

DUTCH BULBOUS ROOTS
AND
SMALL FRUITS.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oskosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO,
via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York.

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Wit and Humor.

HOW HE WAS GOING TO THE CENTENNIAL.

THOSE colored residents of Raleigh who were talking of an excursion to the Centennial have about given up the subject. The idea originated with a gray-haired "uncle" who didn't expect to live another hundred years, and who, it turned out, had a private ax to grind. He planned the excursion on the co-operative principle. To a crowd of his friends he explained:

"I reckon de expenses at $50. Fifty of us will frow in $1 each, an' I will go down thar. When I git back we will frow in another dollar aroun', and de next man kin go, an' we'll keep the system goin' till de hull caboodle hez been down thar."

The idea took at once and was freely talked over, but was knocked in the head at a second meeting by a brother asking:

"Uncle Ike, how long does you expect to be gone?"

"Only two weeks," he replied; "each one will be gone just two weeks."

"If dar's fifty of us an' each one is gone two weeks, what part of de show will de last man see?" was the blunt query.

Uncle Ike tried to convince them that dates and figures were made for mere convenience sake, but the crowd thinned out so rapidly that he was soon left alone. When he had seen the last man turn the corner, he sighed a sad sigh and muttered:

"I guess I'll have to go widout dat razor for another year. Dese here niggers seem like dey hadn't any genius."—*Raleigh Sentinel.*

SPARKS AND SPLINTERS.

THE oyster season opens. 'Raw—'raw—'raw.

A DRAPER'S shop at Paris, one of whose clerks swallowed a table fork two years ago now includes the history of its successful extraction in its large posting advertisements. Purchasers can view the fork and the clerk, and on departing are presented with a bouquet of violets.

ART received rather an awkward criticism from a free-and-easy young man who recently met a sculptor in a social circle, and addressed him thus:—"Er—er—so you are the man—er—that makes—er—mud heads?" And this was the artist's reply:—"Er—er—not all of 'em; I didn't make yours."

A NEW JERSEY street car man wrote to his sweetheart: "I don't care mutch what I do, you seem to feel stuck up above a hoss-car driver; if my hands is large my hart is too. I want yer to understand that it is easy ter cry tears, but at the same time yer hart may be tuffern a bellstrap."

AN old Baptist minister enforced the necessity of differences of opinion by argument: "Now, if everybody had been of my opinion, they would all have wanted my old woman." One of the deacons, who sat just behind him, responded: "Yes; an' if everybody was of my opinion, nobody would have her."

HE was a very young man. A few stray hairs upon his lip attested the fact that he was engaged in a deadly struggle with a mustache. He went into a variety store on Main street, and said to the proprietor:—"Have you Charles Reade's 'Lost Heir?'" "No, I haven't," replied the storekeeper. "But," he continued, looking into the young man's face, "I've got something that will make that mustache of yours start out like boils in spring time."

A PERT YOUTH.

Ella—"Do you like grammar, SAM?" *Sam*—"Don't know, ELLA, never tasted it."

ROOFS.

Why not make your Roofs last a lifetime, and save the expense of a new roof every 10 or 15 years. *It can be done:* If you use Slate Paint, it will not only resist the effects of water and wind, but shield you from Fire.

OLD ROOFS.

Protect your Buildings by using Slate Paint, which neither *cracks* in winter nor *runs* in summer. *Old* shingle roofs can be painted looking *much* better, *and lasting longer* than *new* shingles without the paint, for *one-fourth* the cost of re-shingling. *On decayed shingles* it fills up the holes and pores, and gives a new *substantial* roof that lasts for years. *Curled* or *warped* shingles it brings to their places *and keeps them there.* This paint requires *no* heating, is applied with a brush, and very ornamental. It is *chocolate* color when first applied, but changes to a uniform slate color, and is to all intents and purposes *slate.*

ON TIN OR IRON ROOFS

the *red* color is the *best* paint in the world for durability. It has a heavy body, is easily applied, expands by heat, contracts by cold, dries slow and never *cracks* nor *scales.* One coat equals 4 of any other.

FIRE-PROOF NEW ROOFS.

Mills, foundries, factories and dwellings a *specialty.* Materials *complete* for a *new* steep or flat Roof of *Rubber* Roofing cost but about *half* the price of re-shingling. For Private houses, barns and buildings of *all* descriptions it is far superior to *any* other roofing in the world for convenience in laying, and combines the *ornamental* appearance, *durability* and *fire-proof* qualities of *tin*, at *one-third the cost.* **No Tar or Gravel Used.**

"How to *save* re-shingling—*stop* leaks effectually and cheaply in roofs of all kinds," a **100**-page book **free.** Write to-day; mention RURAL N.-Y.

RURAL RATES REDUCED!

IN announcing the reduction of the subscription price for THE RURAL NEW-YORKER, we can only say that it is done in a spirit of justice to all our subscribers, who are now paying reduced prices for everything. The old price for THE RURAL has been $2.65 per annum, and the

Present Reduced Rate is $2.50 per Annum,

and in clubs of ten or more, $2.

Great encouragement has been given us in our efforts to make the

BEST ILLUSTRATED
Agricultural and Family Weekly

ever published, and we make, in this Centenary Year, this substantial acknowledgment of it. It now costs us less to make the paper, and we propose to give our subscribers the benefit of every cent of the reduced cost.

ALL WE ASK

is that each subscriber and agent will continue his efforts to increase our list so that we can make a still further reduction.

The cheapest paper is not always the best, but

The Best Paper is Always the Cheapest!

Subscribers, show THE RURAL to your neighbors and ask them to subscribe. They will be benefited and you will be profited.

ALL AGENTS ATTENTION!!!

Increase your lists at the reduced rates and get larger Premiums.

THE OAKS.

BY THOMAS MEEHAN.

I HAVE made the Oak family a special study, and from the experience and knowledge thus acquired, I do not hesitate to say that the lover of trees would have more satisfaction in growing Oaks than he would with any other class. Some have hesitated to grow these trees because of an idea that they are difficult to transplant. This is true of a tree that has never been moved. To take an Oak from the wild wood to the garden is surely labor thrown away. Oaks have each a large tap-root and a few main roots that run rather deep. If these are cut off when the tree is but a year or two old, the tree makes a new set, and these latter keep tolerably near the surface. In the course of a few years, however, they assume a downward tendency, and ought to be again transplanted.

A good nursery Oak tree should be transplanted twice — once when one or two years old, and again when five or six. Such trees never die when transplanted under ordinary circumstances. I have seen hundreds moved, after such previous treatment, that were at least 12 feet high and 9 to 12 inches in circumference, with no more loss than if they had been willows or poplars and but 6 or 8 feet in hight. Two years ago I saw over a thousand planted with a loss of less than five per cent.

In transplanting all trees a little pruning is necessary, and to the Oak especially is the use of the pruning-knife very grateful. But a proper discrimination should be made as to what you cut away. Usually people simply "shorten the branches." I have seen them cut so that they were but stumps, with half a dozen snags—mere posts for clothes-lines.

The common people, who who are supposed to have little horticultural sense, say they may as well get a small tree as pay for a large one and then cut it back to stump. And I guess they are right, as there is no occasion for it. It is bad pruning in science as well as in practice. Good pruning leaves all the solid, vigorous branches and cuts away only the weaker ones. It is these sickly, delicate things that always die first in a pinch, any how, and when we are going to have a fight with Nature, as we do when we transplant, the sooner we clear the field of all sickly soldiers the better it will be for the rest. Let any one try this in transplanting and he will find it literally as well as figuratively true. Some people object to meddling with Oaks because they grow slow. They say they will not live to see trees of them. Now, it is rather the other way.

Most of the Oaks are rather rapid growers. True, they do not grow with the briskness of a willow or a poplar, or the *Herinniera* of Africa, which will increase its diameter four inches a year; but I know of numerous cases, and in different species, where the diameter of the Oak has increased three-quarters of an inch in a year, and not under specially favored circumstances either. I have cut many a branch from an eight or ten-year old tree that has given four and five feet of growth as its season's work.

I once made a dozen first-class hitching-posts out of an Oak tree but twelve years old, and which I had to cut away because of a new street. Surely that was growth enough to satisfy any reasonable creature. That tree was of a foreign species, however, the *Quercus robur*, or Royal Oak, which the English tell us has "borne for a thousand years the battle and the breeze," though I presume not growing at this rate all the time throughout the centuries.

Now, I am not much of a materialist. I love money, perhaps, some, but I prefer to have with it some of the spiritual enjoyments of life. I have some trees on my property no money could buy. They seem friends of mine. There are among them Cedars, Tulips, Chestnuts, Gums, Sassafras and Oaks, and many a time have they entertained both me and mine.

I fancy there are thousands who, like me, look up to some tree as to a part of themselves, and who would indignantly spurn the thirty pieces of silver offered to betray it. But there are other trees and other aspects, and I never feel so much like going West and making money as when I look upon my young Oaks and note how freely they grow. There is no timber to equal that of the Oak for certain purposes. Ask any railroad man, any fence-maker, any bridge-builder, any maker of a "barrack" or other farm building—they all place the Oak above and far in advance of other woods. Ask British shipbuilders as to its value in the construction of ships, and they will tell you of its lasting qualities and point enthusiastically to their old, wooden walls of Oak in proof of what they say. It is indeed the Oak which has made England the great nation she is to-day.

A plantation of Oak in the West would be a fortune to any man, and he could turn the fortune over a dozen times in a lifetime, for Oaks become profitable very soon. I should plant them about as far apart and in the same manner as corn, so that for the first two or three years they could be hoe-harrowed like corn, to keep the weeds down.

The first thinning might then commence, and the product be turned to account for "straps" for hoops and boxes, for which there is always a good demand; and for some years afterward, in ways which are hardly necessary to specify, there is an annual use to which the thinning can be applied. In about ten years the acorns appear, and then the mast is of value in feeding hogs and turkeys, and long before we know it the real timber is there! I am quite sure that if I had 160 acres of land in a prairie country, I would put at least 10 acres of it in Oak timber, feeling perfectly satisfied that long—yes, *long*—before I should grow gray, if I were as young as I once was, I would make more out of the land in that way than I should out of any other part of the farm.

Of varieties for rapid timber growth, I incline to the opinion that the English is the best, notwithstanding my regard for the species of our own land. I believe it will grow into money faster and that the timber is at least as good as any in this country, Live Oak not excepted, and then for the purpose of hog feeding none can come near it. It bears young and abundantly, and every year.

For timber purposes, of the hardy kinds of our own species adapted to cold climates the White Oak is good; so is the Chestnut Oak; next I should place the Black, Scarlet and Red Oaks. The bark of the Black and Chestnut Oaks is valuable for tanners' use, for after all the substitutes for bark in tanning and the 4 per cent. of tannin found in Sumac, *Polypodium amphibium*, and other things, I doubt whether most tanners would not prefer good old Oak bark. At any rate, while we are growing good oak timber, we are making bark also, whereas in most of the substitutes the whole growth is useless, except for the percentage of tannic acid they contain.

Passing now from the Oak as an aid to the physical wants of man, I may say a few words for the benefit of those who take an intellectual enjoyment in knowledge for its own self. There are about 300 different species of Oak known. A few of them are natives of Europe, but are more abundant in the United States. The Oaks of the latter country, however, have not much in common with the European species. The Japanese Oaks, on the other hand, bear a close affinity to those of the Eastern United States. When we get to the Rocky Mountains we find *Quercus undulata*, and here we find the first near approach to

ENGLISH OR ROYAL OAK.

the European kinds, it being between the Turkey Oak (*Q. cerris*) and the English (*Q. robur*). In Mexico the species are numerous, and in the East Indies and the Phillipines they abound. What might be termed the Mexican race of Oaks extends up into California.

Many California trees will stand the rigors of the winters of the Middle States, but the California species of Oak will not, probably because they are but emigrants to the Golden State from the land of the Aztecs and have already gone as far north as prudence would dictate.

For ornamental purposes adapted to our general culture, I would make a list were it not that all capable of standing the climate are worthy of culture. They are all so beautiful, it is hard to make a choice. Where it is practicable and the greatest beauty is desired, I think they look best when branching direct from the ground; but still a bold, heavy trunk, straight, tall and branchless, with its head formed of bold, strong branches, is so beautiful that I should not be sorry if I had to be fined heavily for not making a choice. Of those adapted to culture in the Middle States, there are the Overcup Oak (*Q. lyrata*), the Mossycup Oak (*Q. macrocarpa*), Spanish Oak (*Q. stellata*), White Oak (*Q. alba*), Post Oak (*Q. obtusiloba*), Durand's Post Oak (*Q. Durandi*)—a recent discovery of BUCKLEY in Texas; Swamp White Oak (*Q. bicolor*), Rock Chestnut Oak (*Q. prinus*), Michaux's Chestnut Oak (*Q. Michauxii* or NUTTALL), Rocky Mountain Oak (*Q. undulata*)—one of the best for forming into an Oak thicket; Pin Oak (*Q. palustris*), Red Oak (*Q. rubra*), Scarlet Oak (*Q. coccinea*), Black Oak (*Q. tinctoria*), Jersey Scrub Oak (*Q. ilicifolia*)—a good dwarf for thickets; Black Jack Oak (Q. *nigra*), Southern Black Jack Oak (Q. *Catesbaei*), Water Oak (*Q. aquatica*), Upland Water Oak (Q. *laurifolia*), Shingle Oak (Q. *imbricaria*), Willow Oak (Q. *Phellos*), English Oak (Q. *pedunculata*), and Turkey Oak (Q. *cerris*).

Besides the above there are numerous other varieties, the European especially being abundant, and in their characters for practical purposes they are as good a species; indeed, in many respects they are much more distinct.

Our native trees are often found varying in a remarkable degree—so much so, indeed, that some of our best botanists regard the variations as "hybrids." But gardeners who are familar with the wonderful variations among the English Oaks, in which no hybridization is possible, do not accept this opinion. Those who would know all about the American Oaks adapted to culture should read GRAY'S Works—"The Monograph of Oaks," just issued by that great botanist, ENGELMANN—and the RURAL NEW-YORKER.

ENGLISH OR ROYAL OAK.

Mr. THOMAS MEEHAN, in his excellent article on the Oak, which may be found preceding this, speaks in such high terms of the value of the English or Royal Oak that we were prompted to give an illustration (as will be seen by referring to first page) of a handsome specimen of this tree now growing in the grounds of one of our esteemed correspondents, residing a few miles from this city. The tree is about twenty-five years old, and having been planted where it had room to grow, being unobstructed on all sides, the branches consequently spring from near the base of the stem, assuming a natural and most graceful form.

It is to be regretted that our native as well as foreign species of the oak are so little planted in this country, for they are deserving of especial attention, and it is to be hoped that Mr. MEEHAN'S remarks will awaken a new interest in these trees among all of the many thousands of our readers, even if they do not extend any further.

Field Crops.

RYE FOR PASTURE.

IN localities where the drought has prevailed during the present season, pasture will be light and thin next spring, and it would be well for farmers to provide some substitute to make up for the deficiency. We have already recommended the sowing of rye for this purpose, and are pleased to add to our own experience that of the Journal of Agriculture as to the value of this crop for pasture.

Two years ago our corn crop was a short one on account of an extended drought. All kinds of expedients were resorted to, to bridge over the winter months. Not only corn but all kinds of crops save wheat, were comparative failures. We experimented that year with rye and our success was far beyond our expectations. Our first sowing consisted of a ten-acre field upon which we had grown and fed down the corn to hogs. The corn crop had been well cultivated and the ground was entirely free of weeds and grass. We commenced about the first of September by sowing down on the ground and harrowing in with a two-horse harrow. We completed about half the field in this manner, using about five bushels of seed, or one bushel per acre, when we concluded we were not putting our rye in as we should. The remaining five acres we plowed in with double-shovel plows after which we harrowed thoroughly. Our rye soon came up and made a luxuriant growth upon which we grazed pigs, calves and cows during the winter (when not covered with snow) and until such time in the spring as blue-grass pastures would do to turn on. Contrary to our expectations the portion that was only harrowed afforded much the best grazing and the rye was much less injured by the stock going over it than the other portion. After taking our stock off, the rye made a fine growth and yielded more per acre than did our wheat crop, which was not pastured at all and which was sown on much better soil.

We mention this little experience that others may give our readers the benefit of their experience. We are satisfied this crop will grow and be a profitable one upon soil upon which wheat will not pay expenses. As regards the benefits to stock, lambs, sheep, calves or any other kinds of a change of diet during the long winter months it is not necessary to speak, all acknowledge this as a necessity.

CORN FOR THE POOR OF ENGLAND.

THE London Pall Mall Gazette says:—The enormous import of wheat from the United States into this country, and the probability that it will increase rather than diminish in time to come, lead us to reflect how it happens that Indian corn, which is so largely consumed in various forms by all classes in America, fails to find favor with Englishmen at home. In some way maize is certainly to be preferred to wheat; and those who have once acquired the taste for it on the other side of the Atlantic certainly miss the Indian corn on their return. We suppose, however, that there is little hope that our working classes will ever take to this cheap, wholesome and nutritious food. The mere fact that it is cheap, operates in some measure against its adoption. There is nothing, perhaps, in an Englishman's nature so stupid as his dislike to have it supposed that he is content with cheap food. And Indian corn is very cheap.

SOWING SALT ON WHEAT LAND.

THE Toronto Globe recommends that the best time to sow salt on land for winter wheat is immediately before the seed is sown. Where land is plowed in the fall for spring crops then sow the salt late in the season on the plowed land. It is always sown broadcast when applied alone and it has been applied with good effect at the rate of from three to twelve bushels per acre. But all trouble and labor of that kind may be saved by scattering it on the manure heap, when it will do just as much service as when sown alone. That salt is beneficial on many soils there is no question, but it has not been tried sufficiently on the several kinds of soils to indicate with certainty how much or how little will serve as a fertilizer.

Farm Economy.

FARM CROPS IN NORTH CAROLINA.

ANOTHER year of toil is closing and the farmers are reckoning the results. The heat in the first half of July was intense and destructive in this State. The drought was protracted, except in a few limited localities; but the heat was so great that unusual injury was done to farm crops in a short time. The month of August was generally seasonable—restoring the corn and tobacco to a considerable degree.

A respectable but not full crop of corn is made. Perhaps a little over one-third of a crop of tobacco was planted. That is much improved during the last month. I think that more than usual of the old crop was held back and is seeking the market now. Prices are rather high. It seems in this case that waiting will pay. The year has been quite favorable for hay. The first mowing was good; the second injured by drought; the last (not yet cut) promises a very fine yield. Indeed it is seldom that grasses grow as they have for the last month.

Potatoes average well. Early Irish potatoes were hastened by the heat. My experiments this year proved the Early Vermont estimable for quality and earliness, but unprofitable as to quantity. Brownell's Beauty, though not white or mealy, gave satisfaction at the table and produced well. The Snowflake, with only ordinary care, made thirty to one, and possessed every good quality.

Apples are scarce in the central part of the State—probably the same throughout the entire State. There has been enough of them for a limited supply for immediate demands. Enough peaches to remind us of the delicious feasts of other years and awaken the hopes for another season.

The scarcity of money is sorely felt. The people generally are perforce practicing more economy, and slowly adapting themselves to the stringency. There is a growing impression that we have seen the worst of the "hard times."

Yours truly, N. C.

A CORN HORSE.

H. IVES writes to the New York Times that a corn-horse is an implement of so much utility in harvesting corn that it is a wonder that so many farmers will cut up their corn without the aid of one to stand the shock up to while cutting. It is a tool which any farmer who wants it will make for himself, for there are none in market, and no agent about to tell us of their great usefulness. But they are of no less merit for all that. By using one to form the shock to, instead of placing it against a standing hill, we have something much firmer to stand it to, we have all the corn cut up, and are pretty sure to have the shock better balanced, and for that reason standing better, because every quarter as it is cut will be placed into each quarter section of this implement (or corn horse), thus bracing the whole nicely from each quarter when bound together at the top.

For instance, if I take six rows of corn for a row of stooks, and six hills of a row (as I generally do), giving thirty-six hills to a bunch, I take my horse in between the third and fourth rows and stand it for the shock between the third and fourth hills; standing so it represents nine hills in each quarter. Then I cut the first three hills of the third row and place in one quarter, while the man working against me cuts the first three hills of the fourth row and places them in the second quarter opposite. Then each cuts the next three hills of the same rows, placing into third and fourth quarters. Next cut the second and fifth, then the first and sixth rows just the same, thus only putting three hills into each quarter at once alternately, will balance it up good to stand.

The best way to make a corn horse is to get a dry cedar pole 16 feet long, about 4 inches at the butt, and if a little crooked, bowing about a foot all the better. Put two legs into the butt of the pole 2½ or 3 feet long, with a spread of 2 feet on the ground, and so as to have the pole bowing up if it is crooked, for then it won't require so long legs. At 5 feet back from these legs bore an inch hole horizontally through the pole, through which insert a loose pin 20 inches on each side, that is, 3½ feet long. Then for use stand this in the corn as described above, so that the shock will be stood up into the angles made by this pin and the pole. When this is cut and bound pull out this long pin, then taking the large end of the pole draw it ahead through this shock and place it for another, and so on through the field. It will be found plainer, handier work, and can be done by coarser or less skilled help to put it up in good order as quick and as well as in any other way.

PROTECTION AGAINST GRASSHOPPERS.

DANIEL G. LANE writes to the Council Bluffs Globe, from Bermuda, W. I., telling how crops may be protected against grasshoppers, and potatoes kept clear of beetles. Now while we do not believe either of the protective agents proposed are of any practical use still they may be worth trying. Mr. Lane says:—For the last two weeks I have been in this country from the West Indies, and I find the grasshoppers making great ravages in vegetation. In order to prevent this, burn one pound of sulphur on charcoal, in the center of a field, and save what it has taken so much toil to develop. To prevent potato bugs from destroying the crop, plant two grains of flax seed in each hill. This will prevent them from injuring the potatoes, as they will not go near the flax.

The Horseman.

THE COACH OR CARRIAGE HORSE.

THE Kentucky Live Stock Record takes a very sensible view of the late excitement in breeding fast trotters, to the neglect of the good carriage and general utility horse, and we are pleased to place its remarks before our readers as they are worthy of a careful consideration.

The old style coach or carriage horse is almost extinct in Kentucky. His place is supplied by the trotter. The horse of five and twenty or thirty years ago is rarely seen now-a-days. The big bays, browns and chestnuts of former days, ranging from 15¾ to 16¼ hands high, with deep and well-proportioned bodies, arched crests, strong and clean bone under the knee, open, sound, tough feet, with great knee action, lifting their fore feet high, are as scarce now as they were plentiful at that period. The display of coach and carriage horses at our local fairs some years ago, as well as at other less notable gatherings, was one of the most popular and charming parts of those exhibitions. Most of these horses walked and trotted well, picked up their fore feet smoothly, bent their knees and kept their hind feet well under them. This activity, with their great beauty, short, pointed ears, extra style, hardiness, endurance and docility, eminently distinguished them as splendid specimens of the coach and carriage horse.

Without the speed of the modern trotter, they stood remarkably well over our hard unyielding macadamized roads, and could travel all day. Our farmers would do well to go back and breed this class of horse and give up to a great extent the breeding of trotters, the supply of the latter in the last few years being greatly in excess of the demand.

Suitable sires to cross with the common mares and stock of the country can be obtained at a trifling expense among the many thoroughbreds that either break down yearly, or have not sufficient speed to be classed high as racehorses. Among them are many strong, stout and sound horses that can be bought cheap and whose service fees could be put at from $10 to $25, and pay a handsome per cent. on the investment. Nearly all our farmers seem desirous of breeding a trotter, and every year valuable mares are bred to inferior sires because they stand cheap, many of whom possess serious deficiencies. In this section, one of the best breeding districts in America, there are every year many indifferent sires advertised, whose stud career it would be better for the country at large if it was cut short by the free use of the knife. Many of these candidates for public patronage possess neither beauty, style nor finish, but have many faults which should not be perpetuated, such as weak, narrow loins, light thighs, bad curby hocks, light bones and thin, shelly feet. Many of them have nothing beyond their breeding to recommend them, and this often consists of some remote connection with a once fashionable strain of blood.

When farmers use such sires there is great uncertainty in producing sound, good-looking offspring. We would not be considered as opposed to the breeding of trotters, for we are not; but we are opposed to the indiscriminate breeding of mares either unsound themselves, or to sires that are unsound, with the expectation of getting a sound colt, fast trotter or good coach horse. When a farmer possesses a well-bred mare of known blood or of high form and marked characteristics, it is well to breed to the best sire within reach, but to breed a common mare of little trotting action to the best trotting sires, will oftener fail than succeed in producing a good trotter, and in nine cases out of ten will bring the farmer in debt before the youngster is half developed. Dissatisfaction and disappointment are nearly sure to follow such breeding, and when it does fail, the blame is generally laid on the sire, irrespective of the bad or indifferent qualities of the dam.

With young trotters selling in Kentucky at from $150 to $250 per head, even after they are broken and partly handled, it will not pay to breed anything but the best mares to high-priced stallions. Most of the stallions in Kentucky have been standing too high, and they must come down to suit the times. It is well enough perhaps for a few who have acquired a national reputation through their produce to demand high fees, but they are few and far between. It will not pay to breed common or ordinary mares of the country to $100 and $150 stallions.

We firmly believe that it will pay a majority of our farmers better to breed and rear the old style coach and carriage horse than it will the trotter, especially when you take into consideration the cost of the stallion's services, and the expense necessarily incurred to develop the trotter. There are a number of men who make a speciality of breeding trotters, and it should be left with them. If a farmer possesses good mares he had better breed on the shares or farm them to some reliable breeder, than to breed himself, and have the country dotted all over with tracks, his sons driving young trotters to the neglect of more important work on the farm. The farmers of this State have enormous advantages over other less favored sections of country. We have better material than is to be found elsewhere, from the long and free use of thoroughbred sires, which enables our farmers to enter into breeding under more favorable circumstances. We are in possession of the most delightful climate, the finest soil and most luxuriant grass region in the world and need fear no rivals; and the large number of thoroughbred horses bred annually that are not good enough for races, furnish capital material to produce the coach, carriage and general utility horse.

FEVER IN THE FEET.—There is nothing better for fever in the feet of horses than bandages wet with water. It is better than "stuffing" with filth, so often recommended.

Dairy Husbandry.

AN EXPERIMENTAL DAIRY STATION AND ITS NEEDS.

For some years past, the establishment of an experimental dairy farm has been agitated at our dairy conventions, and we have alluded to the subject from time to time in these columns. It is a question of deep interest to those who are looking to the progress of the dairy. In what manner it should be established, whether in connection with some college or university, or whether separate from such institutions, there seems to be a difference of opinion among dairymen. Those who favor the university connection urge, that as such institutions have regularly-appointed professors, whose salaries are paid by their respective corporations, all analyses or work requiring the skill of trained scientists could be performed at little or no expense chargeable to the experimental dairy station. On the other hand, if trained scientists are to be employed to do the analytical and professional work of such a station, in addition, of course, to the superintendent who is to conduct the necessary experiments, the cost of maintaining such station would be very greatly enhanced and with no particular gain, so far as investigations and results are concerned.

We are told that Cornell University has offered to take charge of the analytical department of any such dairy station that may be inaugurated, and perform all the necessary work requiring the skill of special scientists. All, then, that would be required is the farm, the buildings, the stock, and the necessary tools and appliances for conducting the farm experiments, with an intelligent and capable superintendent to take charge of and record such experiments as are to be made. We presume there are other colleges in the State of New York that would be willing to take upon themselves the chemical and other scientific work connected with such a farm on the same terms as those offered by Cornell. The latter institution, however, may be better fitted for such work, inasmuch as it has an agricultural department with special professors, which does not obtain in many of our colleges.

Now why is not this plan as feasible as any? The main difficulty in organizing an experimental dairy station is the expense. If large appropriations from the State or from private individuals could be had, sufficient to maintain a laboratory, a chemist, a veterinary surgeon, a microscopist, and other professors needed and connected directly and solely with the first, doubtless this, in some respects, would be best; but as we are not likely very soon to get such endowments, the plan proposed seems to be the easier to be accomplished.

Had the $15,000 or $20,000—which has been raised and squandered in the effort to make a dairy display at the Centennial—been devoted to the purchase and equipment of an experimental dairy farm, we should have to-day something to be proud of—a substantial beginning of that progress in dairy husbandry which every true friend of the dairy has for a long time ardently wished. But, under the "Ring" management, it is feared the Centennial dairy display will have accomplished nothing. It will be a warning, however, for dairymen in the contemplated inauguration of an experimental dairy station, to so guard the preliminaries of the work that it shall not fall into a few selfish and partisan hands who will be intent on running such an enterprise for private ends. The men to carry forward any great undertaking of this kind must be above any selfish motive or partisan spirit. They must have the public good at heart, and be willing to make sacrifice of self that the great dairy interest of the country may be permanently benefited. Under the guidance of such men, we may hope to make an experimental dairy station an honor to the State and a means of advancing dairy science and practice, and thus to achieve distinguished success for American dairying.

Pertinent to this question, we find some very sensible remarks from Mr. O. S. Bliss, the well-known Secretary of the Vermont Dairymens' Association. He is urging an experimental farm station for Vermont, and says: "Every farm or garden whose accurate experiments are conducted and recorded in detail is, to all intents and purposes, an experiment station. I much doubt, however, the propriety of designating a chemical laboratory devoted to the analysis of fertilizers an experiment station. An analysis is not, in any sense, an experiment. But we need not quarrel over terms, if we are able to comprehend their intent. It matters but little where an experiment is conducted, provided it is intelligently and honestly conducted. The great difficulty with the great mass of experiments is, that they are not well formulated to begin with, and that important elements are overlooked, either in the experiment itself or in the recording it for others' use. On this account not one in a thousand of the experiments reported in the newspapers and elsewhere, is worth the paper on which it is printed or written. In discussing the need of a Vermont experiment station and the manner of supplying that need, we are prone to overlook the fact that we have, at this time, the benefit of the very large experience of others, and we are not compelled to grope our way wholly in the dark. We should start where they are leaving off. We have in the University of Vermont and State Agricultural College an institution qualified, competent and willing to do all the needful scientific work of an experiment station. Perhaps the same is true of the other colleges: I do not know. We have a Board of Agriculture, which should be competent and willing to formulate and direct any practical experiment. We need then a good, well-stocked farm in the charge of an intelligent, painstaking farmer—nothing more—to work out in the soil, in the stalls or elsewhere the experiments."

Mr. Bliss further makes the offer that if the State or any State society will invest $10,000 in a farm, fixtures and stock, well and properly located, he will undertake to work out every needed experiment for ten years, and, at the end of that time, return the farm, etc., etc., in better condition than he took it, and without a dollar of further expense.

This, it would seem, is a very liberal offer, and it shows how much may be done with a fund of $10,000. We have no doubt that competent persons may be found in New York State also who would be willing to engage in the work on similar terms. Under such an arrangement, it will be seen the experimental farm becomes self-supporting.

Again Mr. Bliss says: "I sincerely believe such an experiment station, located anywhere in Vermont, would pay for itself to the State at large the second year and every year thereafter. We need, more than all else, accurate experiments in the common details of farming, dairying, stock-growing, orcharding, drainage, etc. The commercial fertilizer business is now, and ever will be, of secondary importance in Vermont. We need far more to know how to employ commercial food for our stock, how to convert that into farmyard and stable fertilizers, and how to apply them to advantage. A large part of the experiments needed should pay as they go. Original investigations of merely theoretical topics, which are more expensive and less important, may be relegated to the National Department of Agriculture, or most anywhere else, for the present, at least."

We should be glad to see an experimental dairy station established in New York. It is especially needed, at this time, to settle many questions in dairy produce which now have a divided opinion among dairymen. We hope to see great progress made in dairy husbandry, and especially in the economies of the business. It is the waste in many departments of this industry that presses most heavily on the nett income of dairy farmers, and it is from the avoidance of this waste that some dairy farmers often see their way out of difficulties that so often prove disastrous to others. The mass of farmers need a knowledge of the best way of managing dairy farms, of feeding stock for the production of milk, of the manipulating of milk for the manufacture of the finest goods, of preserving these products perfectly until they reach the consumer, and of many other points connected with the business. These can, perhaps, be best obtained from an experimental dairy station, where the experiments are so carefully and perfectly conducted as to carry the weight of authority in their proofs. Let us, by all means, have an experimental dairy station; but, in endeavoring to inaugurate such a project, let the proper precautions be taken that the measure be not killed by a "Ring."

MILK SUGAR.

We hope the time is not distant when the chemists may find a use for milk sugar that will create a large demand for it, so that it will enter into commerce on an equality with other articles of general consumption. Should this occur, we should have another element of the dairy which would add considerably to the profits. In the making of cheese the milk sugar, as is well known, mostly pours off in the whey. Of the solid constituents of whey, the milk sugar is in the largest proportion, ranging from 4 to 5 per cent. In an average sample of milk we have, in round numbers, water, about 87 parts; butter, 3½ parts; casein, 3½ parts; and milk and sugar 5 parts, the balance of the 100 parts being mineral matter.

It will be seen that the milk sugar contained in milk is larger than the proportion of butter, and is as 5 to 8 when compared with the butter and casein combined. An estimate has been made of the annual yield of sugar from the whey of 30 factories, averaging 400 cows each, and it amounts to the enormous quantity of 2,000,000 lbs. or 10,000 bbls. At the price of only 10c. ₩ lb., a factory of 1,000 cows, on the above estimate, would yield 800 lbs. of milk sugar per day worth $80, or $2,400 per month. Milk sugar, at the present time, brings a high price. It is used by homœopathists as the vehicle for their medicines, and, in other practice, as an article of food for infants in teething, being less apt to produce acidity than cane sugar. It has also been recommended as a non-nitrogenous article of diet in pulmonary diseases. The demand, being limited, regulates its production, we suppose and from its comparative scarcity, the price of course is high, being sold at the shops not unfrequently at a dollar per pound.

The milk sugar of commerce comes from Switzerland. It is made, we have been informed, by allowing the whey from cheese-making to trickle down the sides of the mountains in wooden troughs or gutters. Threads are placed in the gutters, upon which the sugar adheres as the watery portions pass off in evaporation.

On the authority of the American Encyclopedia: "It is prepared from whey obtained from milk coagulated, with a little dilute sulphuric acid, and left several weeks in a cool place to crystalize. The crystals of sugar of milk are collected and decolorised by animal charcoal and repeated crystallization. By the homœopathists, sugar of milk is regarded as the most inert substance upon the system, and for this reason, as well as on account of its great hardness, which causes it to reduce to extreme fineness the substances with which it is ground, they esteem it as the best medium for their medicines, and are, by far, the largest consumers of it."

We have no doubt there are various ways in which milk sugar could be used for food, and if these were shown, it might prove an important source of profit to the dairy. Among the new uses to which substances are being put, from time to time, it is a matter of no little surprise that milk sugar should not be on the list. From the large quantities of whey at the factories, the material would not be wanting for the production of this sugar to meet almost any demand. Will not some of our chemists tell us how this product can be utilized and then the best method of manufacturing it. If as much, or more, can be made from the sugar of milk as can be obtained for the butter, the prospects of dairying will be cheering.

The Poultry Yard.

KEEPING POULTRY.—No. 6.

After building the house, completing interior arrangements, and we are about putting in the fowls, the question is (if not thought of before) how many fowls will the building accommodate without crowding, and give them room enough to keep healthy? This is another rock that many an amateur founders upon. First, he sees one lot of fowls that he likes and procures them; then by chance he happens to find some better ones, and thinks he must have them also; or he sees another kind that he would like to keep; he is likely to begin overcrowding. By far the best way is to begin with too few rather than too many, keeping to one variety and thoroughly understanding it by experience before branching into many kinds.

One can more enjoy what he has, when contented with a reasonable number. A house four or five feet square should not contain more than a cock and three hens; a house 8 by 10 feet, twenty birds; 12 by 16, fifty; or an average of four square feet of ground room for each inmate of ordinary size. Bantams require a third less room. These limits, I believe, must not be encroached upon under any circumstances. If on a farm and the fowls have unlimited range; are of a hardy constitution, and all the sanitary rules laid down are rightly attended to, then they may be increased a quarter to a half more in number. If you keep pure bred fowls with the idea of raising show birds, and wish to improve the stock on hand, give them all the study and attention they require; observe the peculiarities of each *individual bird*, and if you do not keep a written register of your stock, do so mentally, that you may observe the results produced from each hen and her mate. By so doing you will easily find out *how* to improve your stock, or keep up their high standard if already attained. No breeder of fine poultry should breed with so many birds that he cannot take proper cognizance of each individual. He will then derive such pleasure and interest from his pets as only a true fancier can enjoy. Poultry keeping, if commenced in this way, is much more likely to be a permanent pleasure, and some profit is sure to be derived from it. Keeping the economical point in view, as here recommended, does not incur a great outlay and does not bring many regrets at useless expenditures.

Very few indeed ever kept pure bred fowls without going through most, if not all, the experiences here cautioned against, and it has been a great hindrance to the general development of the "fancy," and has brought it into bad repute with many people who would otherwise have been ardent admirers of such beautiful specimens of creation. H. Hales.

QUESTIONS ABOUT POULTRY.

T. S. L., LeSeur Co., Minn., H. W. M., Wasoca Co., Minn., and J. B. D., Story Co., Iowa, ask the following questions, requesting answers in the Rural New-Yorker:

1. How many fowls can be kept in one enclosure without loss in health or egg production? 2. How many fowls would it do for a man to keep, giving his whole attention to them? 3. What is the proper size of a house to accommodate 100 fowls? 4. What is the best floor for a hen house? 5. Why do you prefer the Light Brahmas? 6. Cannot the small breeds, such as Leghorns, be raised much cheaper than Brahmas? 7. What will cure chicken cholera? 8. Can hens be cured of the habit of eating eggs? 9. Can they be cured of feather eating? 10. Are ducks, turkeys and geese as profitable as other fowls?

1. My experience in the last nine years would be in favor of keeping thirty in a pen, having been most successful with that number. I have, however, wintered as many as 100 in a pen with no bad effect. Mr. B. F. Squires of Long Island has kept as high as 350 in a pen with satisfactory results. It is risky to keep more than 50 in a single enclosure.

2. It would be imprudent for a man to keep more than 600 fowls, and very imprudent to keep even that number unless he was very skillful and careful.

3. A house twenty feet square will give 400 square feet of floor, or four square feet to each fowl, which is about the right proportion.

4. Any floor that is hard and dry is good enough, but I think asphalt is the best, if cost is not a consideration.

5. Because I find the most profit in them. To speak a little plainer: because they lay when eggs are scarce and high; they sit early and give us early chickens. Then they begin to lay again just in time for the mid-summer rise, and molt, before cold weather, and are ready to lay again when others cease on account of cold weather. When dressed, they will sell for from 10 to 30 per cent above your "20-ounce," pin-feathery breed; and you can fence them in without rooting the yard.

6. You can raise three Leghorns with the same grain that it takes to raise one Brahma; but the Leghorn, when grown, will eat just as much, in proportion to the number of eggs laid, as Brahmas; and when killed and dressed the latter will bring as much as four Leghorns. It is as foolish to talk about one breed of fowls laying more for the food consumed than another, as to talk of one millstone making more meal than another, in proportion to the corn used;* and it will take just as much corn to make six pounds of chicken on two legs as it will to make it on eight legs; but your six-pound fowl will bring 12½c. ₩ lb. when your 1½ lbs. bring 10c. This is not merely in our own local market, but in Chicago and New York.

7. I don't know. It can be prevented by furnishing the fowls with fresh water each day and keeping the house clean. I do not have diseases enough in my flock to get any practice in doctoring.

8. I have cured them of this habit by putting the fowl in a pen where there was a nest of "spoiled" eggs. They would not want to try it again soon. Prevent their getting this habit by making the nests dark.

9. By cutting off their heads. I know no other way.

10. My experience with ducks is unfavorable. They had a bad habit of dying, apparently without cause. Turkeys are good to destroy our meadow grasshopper, and are profitable to raise if you can give them the necessary care. Geese are strangers to me. A. M. Van Auken.

Fort Howard, Wis.

* We think our correspondent is all wrong in declaring that it is "foolish to talk about one breed not laying more eggs than another for the amount of food consumed." Our own experience leads us to believe that there is a very marked difference in breeds, amounting, in some instances, from 25 to 50 per cent. in the number of eggs produced from a given quantity of food. The same will also hold good, but not to such an extent, in the production of flesh, some laying on far more flesh than others from the same amount of food. If there was no difference in breeds, regarding their egg or meat-producing habits, each requiring a certain amount of food to produce certain results, the choice between them, would be much less than it is now. As well might we claim that it required as much food to produce a pound of butter from one of our best Jersey cows as it does from that of the poorest common stock, or that a Short-Horn steer will lay on no more fat from eating a ton of meal or hay than one from the prairies of Texas.

If our own experience counts for anything, the Brahmas will beat the Leghorns in laying on flesh; but fall far short when it comes to the egg question. What say our correspondents on these mooted points.—Ed. Rural.

Industrial Societies.

N. Y. STATE AGRICULTURAL SOCIETY.

36TH ANNUAL CATTLE SHOW AND FAIR,

ALBANY, Sept. 13, 1876.

ACCORDING to the regular rotation every third year, the Centenary finds the meeting of this Association here now, and a more roomy and commodious ground could hardly have been selected. Excellent cattle and horse sheds, with good, substantial buildings for Machinery Hall, Stove Hall and Domestic Hall are supplemented by good Headquarters and numerous neat little offices scattered over the grounds for the use of the heads of departments.

The meetings of this Association have long been recognized as the most successful State meetings in this country, and the Fair this year, while it is of course somewhat dimmed by the great Philadelphia Exhibition, is a much greater success than many supposed it would be.

The display of Live Stock is simply magnificent in proportions and quality, and forms one of the most attractive features of the exhibition.

FLORL HALL is not so full as it might be in some respects, few but amateurs making any exhibits in floriculture. ELLWANGER & BARRY of Rochester, display a fine collection of fruits, consisting of 129 varieties of apples, 102 of pears, 35 of plums and 33 of grapes. Nothing new among them was observed; but the whole exhibit does them great honor. In addition to their fruit, they exhibited 113 different varieties of roses. ARTHUR MCCORMACK of Bath, N. Y., displayed 46 varieties of grapes, among which he had no novelties. D. C. WILDEY of Hudson, N. Y., exhibited 10 varieties of pears and 8 of plums, including a new seedling plum of excellent quality. There were several other small collections, some of which were quite praiseworthy.

DOMESTIC HALL contained the usual show of sewing machines, bed-quilts, pianos, dish-pans and numerous knick-knacks of all sorts and kinds generally found there. Among the noticeable exhibits were the Cortland Wagons, which attracted much attention by their strength and beauty of construction. This company bids fair to make an appearance on wheels before the world some day in such a way as to leave a track behind them.

THE DAIRY display is so near a failure that I am almost led to believe the "Centennial Dairy Ring" must have been around. If I were not fully satisfied of the entire trustworthiness of all the officers and employees of this Society, I should have been induced, by contemplating this display, to look around for the familiar Philadelphia faces which are to be found at Mr. POPE'S CHEESE PALACE at the Centennial.

THE POULTRY exhibits were very full and of excellent quality. There have been N. Y. State Fairs when this feature received comparatively little attention; but this year the poultry breeders seem to have surpassed themselves here, hence a most excellent exhibition of all kinds of poultry, including some of the finest birds ever seen in this State.

The weather is cool and fine to-day and people are flocking through the gates on both sides of the grounds. A large attendance is present and more coming all the time. The awards have not all been made yet; but will probably be completed by to-morrow.

The display of AGRICULTURAL IMPLEMENTS and machinery was not as large as usual, probably on account of the Exhibition at the Centennial. Several new implements were on the grounds and a number of exhibitors from the West showed their goods for the first time at the East. Western manufacturers are beginning to sell in the Eastern and Middle States quite largely, their facilities for cheap manufacture overcoming the price of freight.

I noticed among the improvements the New "Monitor" Portable Steam Engine, Batavia Steam Engine Co., Batavia, N. Y. This was the only steamer on the grounds, and was used to propel the Sweepstakes Power Thresher and Separator, C. Aultman & Co., Canton, Ohio. The latter has been improved this year by lowering it about eighteen inches, making it now all in one frame. They also have an improvement on their end shake, using a drop to prevent the carrying over of grain with the straw.

O. H. P. Cornell, the new owner of the Albany Agricultural Works, claims several improvements in their Thresher and Cleaner. One is that they work both shakes with one Pitman, and, by using a rubber spring on the shaker shoe, the lost motion is taken up, thus saving about 20 per cent. of power.

The Wheeler & Melick Co. have added several good features to their Threshing Machine. The connection rods are now made so that they can be tightened at will by an end screw pressing up on the outer end of the box. They also use a new self-tightening joint that will keep the rod at all times in line with the main shaft.

Philips' Spiral Corn Husker was in full operation. This machine has been improved this year by lengthening the rolls, thus increasing its capacity 15 per cent, with the same power.

There was a very good show of plows, the principal exhibitors being Carter & Sons, Gregg & Co., New York Plow Co., Robinson Chilled Plow Co., Remington Ag'l Co., and Ford Bros., Gregg & Co. showed the Osborn Sulky Plow, which attracted a good deal of attention. The Robinson Chilled Plow Co. showed their New Chilled Plow for the first time at a State fair. The chilling and carbonizing process through which the iron is passed, renders it harder than steel. They will scour easy in any kind of soil, and are specially adapted to hard lands. The Remington Ag'l Co. made a fine showing of Mohawk Valley Clipper Steel and Carbon Plows. Their New Carbon Plow is made of a combination of cast and wrought iron and steel, put through a carbonizing process, which makes it one of the hardest metals known, it scours easily in all varieties of land, and has proved a success during the past season. The Bleeker Rotary Plow was shown here for the first time. This is a novelty which I should like to see in operation. Gifford, Johnson & Co. showed a full line of Wright's Walking Cultivators.

Grain Drills were represented by the "Farmers' Favorite," "Centennial," "Champion," "Buckeye" and "Empire."

P. P. Mast & Co. showed for the first time in this State the new "Buckeye" Broadcast Seeder and Cultivator, which has their new force feed regulated without change of gear, and can be used for any kind of grain or grass seed.

Mowing and Harvesting machines were not as well represented as usual. Among the many labor-saving implements of this class I noticed the Walter A. Wood, with the new Locke binder attachment, which proved such a great success at the Centennial Field Exhibition last August; "Buckeye," "Bradley," "Crawford," "Kirby," "Wheeler No. 6," "Victor," "Wood's Eagle," "Warrior," &c.

Adriance, Platt & Co. showed Brown's new Self-Raking Reaper. In building this implement special consideration has been paid to lightness and strength. It weighs 650 lbs., cuts 5 ft., has a draft of about 180 lbs., and the price will be in the neighborhood of $120. A few were put out last year and, as far as heard from, worked well.

Bradley Mfg. Co. showed their New Self-Rake Reaper, which will be put in the market next season. Wood's Eagle Reaper Co. have improved the rake head of their self-rake reaper by dispensing with the spring and using a cam and trip, making their rake more easily adjusted.

Hay Rakes were in good numbers, among them were the "New Adriance," "Bradley," "Archer," "Field's Self-Discharging," "Yankee," "Albany," "Wisner's Tiger," with Wisner himself to back it, "Centennial," "Ithaca," etc. A New Self-Dumb Rake was shown by Alexander Ricket. It has a new friction grip—very simple in its operation. Four or five of these rakes have been successfully tried the past season; but we can not say as to what its true worth will be until it is more fully tested. The "Centennial," exhibited by the Wheeler, Melick Co., is a neat rake, brought out, for the first time, in "1876." It is a self-dump, with a friction grip. The axle revolves with the wheel, and is divided in the center, allowing each wheel to act independently. It has no ratchet gearing. The clutch is operated by a friction band, which needs very little pressure from the foot to dump the load. A number of these rakes were sold during the past season, and, as far as heard from, have given good satisfaction. A. B. Cohn showed—as new in this State—the Common-Sense Stalk Cutter, and also their "Prize" churn.

Abbott, Brew & Co. exhibited the Centennial Feed Cutter. This machine is simple, compact and easily operated. There is no gearing in the knife-box to clog the feed. The knife-shaft makes 4½ revolutions to each turn of the crank. The upper feed-roller is self-regulating, either end rising independent of the other, making the pressure on the fodder equal at all times. This firm also show the American Cider Mill and Press, which crushes the apples thoroughly, breaking all the cells, and can be adjusted to work either coarse or fine. It will grind grapes without crushing the seed, and makes a good wine mill. The wear on the roll-shaft is taken up by an eccentric, so as to keep the mill true. The press has a center drain, by which the cider is run off in the middle of the tub. The staves of the tub are riveted on, making it stronger.

The Mohawk & Hudson Mf'g. Co. show Dodge's Excelsior Hay Press. This press is set on wheels, so that it is easily transported and is ready for work at all times. The power is mounted and carried on the forward part of the truck. It is a self-feeder, making a circular bale, and presses ten tons to the car. It is meeting with good success in our haying regions.

The show of dairy implements was very small. John Campbell exhibited his new oscillating Monitor Churn. This churn is made of tin and has the oscillating motion of the "Bullard," without its steadiness. Dairymen who have seen it do not think it will be a success, on account of the material used. H. W. Howe showed the new "Howe Churn." This is a barrel churn set on a frame and worked by a handle; it has adjustable dashers inside. It is claimed that this churn has all the good points of the old dash churn.

The Monitor Milk Pan Co. had a fine set of their Milk Pans on exhibition. A. H. Reid made a good show of Butter Workers, which attracted a great deal of attention. G. F. & D. G. Wetherill made an exhibit of Papplein's Silicated Superphosphate of Lime, which they are now introducing throughout the country.

The Wagon show was very light—not a single farm wagon being on exhibition. The Cortland Wagon Co. made a fine show of their Platform Spring Wagons and carried off most of the premiums. These wagons are now coming into general use, and the manufacturers will soon have to enlarge their works again, so as to be able to meet the increasing demand..

J. M. Childs, E. E. Lummis and many other of our large dealers in agricultural machinery were on the grounds looking after new improvements.

SHORTHORN.

[THE further report of this Fair, including the list of principal awards, will have to go over till next week for lack of space.—ED.]

Sheep Husbandry.

BREEDING SHEEP FOR MUTTON.

TIMES may be dull and the price of wool low, still the farmer knows that both wool and mutton will always be in demand hence, instead of being discouraged should pay more attention to breeding for a purpose, and if it be mutton we commend the advice given in the following from the National Live Stock Journal which is quite timely as well as sound advice:

Now is the time for the farmer who expects to breed lambs for the markets, or who keeps a mutton flock, to be looking about for his breeding ram. In breeding for mutton, we must have early lambs; say from February to April. We consider a lamb dropped in March worth two dropped in May or June, for almost any purpose; and, for the spring-lamb market, they should be born a month earlier.

The first question to be considered, is the breed. It is doubtless true, as has been argued of late, that the excellent Merino sheep of American breed can be—indeed, have been, in some flocks—greatly improved in early maturity—a point of great importance where sheep are reared for mutton. And it is also true that they have been improved in grazing and feeding qualities—that, in fact, the form of the carcass, in the best varieties of this wonderful and most ancient race of sheep, has been brought much nearer the type we require for the production of flesh, than was thought possible forty or fifty years ago; but, as growers and feeders, they are still far behind the best long wools, and in quality of flesh, their advocates do not claim that they approach the excellence of the Downs.

The selection of the breeding ram, therefore, where mutton is produced, must be from the long wools, or the Downs. If we make choice from the former, we must be careful that we have an animal of stout and robust constitution. These sheep have been so generally forced with artificial food, that many of them lack the hardiness required for the farmer's purposes. What we must have, is a straight, round barrel, on short legs, with short, stout neck, and vigorous, masculine appearance about the head. The body should be well covered with a long and lustrous staple, of uniform quality. If the selection be of the Southdown breed, we should have the same general form as here described, but we ought to have a more compact and snug carcass, with a good deal more weight for bulk, than in the long-wool breeds.

In some neighborhoods the Shropshire Downs may be had—a variety that originated from a cross of the old long wools with the Downs. They are a very profitable sheep for the market—larger than the Southdowns, and their fleece much heavier. While the flesh is not equal, in fineness of grain, and delicacy of flavor, to the true Southdowns, they are even better growers, and, consequently, more profitable for the markets. Our advice would be, therefore, to those who are breeding mutton sheep to sell, to breed from a stout long wool, or a Shropshire ram, selecting the stoutest ewes that can be had from crosses of the same breeds, if they can be had, if not, the best you can get of the common sort, as near the approved form, as above given, as you can get them.

But if you want for your own use something that surpasses all flesh in healthfulness and in nutritious value, with a delicacy of flavor that rivals the best venison, secure a few pure Southdowns. They are as hardy as any race, and, though less thrifty in growth than the larger varieties, with a lighter, and, therefore, less valuable fleece, they are, on the whole, a profitable sheep for those who properly estimate quality in mutton.

It should be stated in this connection that, while it is most desirable, in all departments of live stock to maintain the purity of the several races, it is nevertheless true, that cross-bred animals, if the sorts are good, are likely to be more thrifty and more prolific than those of the pure breeds that have been closely inbred. For producing mutton for the markets, therefore, we may anticipate very satisfactory results from the use of a good, well-bred ram on grade ewes of the right stamp, or even common ewes, if they are of good form and constitution.

But we urge upon our readers not to breed from inferior animals, whatever the breed or variety, when good ones are everywhere within reach at moderate prices. Indeed, it is much better not to breed at all, than to use stock defective in form, and unthrifty in habit. As in growing crops, the farmer must have, first of all, a good variety of sound and healthy seed, so, in stock growing, the good blood, and especially the sound, well-formed and vigorous sires and dams, must be had, if we are to have satisfactory or profitable results.

We trust our readers will excuse us for pressing this consideration upon all sheep breeders in regard to the selection of rams. The best-bred and best formed Merino rams may now be had for $50 to $100, and the long wools or Downs are quite as cheap; and when we reflect that we may have 50 to 100 lambs from a single sire, what a waste of money it is to use an inferior, flat-sided and light-fleeced ram, because he can be had for $10 to $15! The defects of a bad sire, used for a single season, will be visible in a flock for many generations, so that the injury done cannot be estimated; and the services of such an animal will never be accepted by an intelligent breeder, if tendered as a gratuity.

In conclusion, we suggest that the temporary low prices of sheep should not deter breeders from giving attention to breeding for the best. Indeed now, more than ever, should we all strive to weed out the inferior, and breed up for the most approved types.

Scientific and Useful.

QUICKSILVER—HOW IT IS MADE.

FEW of our readers probably have any idea where quicksilver came from or how it is made, but the following very excellent letter from a correspondent of the American Grocer throws much light upon the subject:

California, in addition to being the largest producer of silver and gold in the world, also has the richest quicksilver mines, and the name "New Almaden" has become synonymous with quicksilver all over the world. Having the good fortune to meet Mr. J. B. Randal, the Superintendent of the company, we were favored with an invitation to visit "New Almaden" and see how this volatile and interesting metal is produced; and taking the cars one afternoon, a ride of fifty miles, by the Southern Pacific Railroad, brought us to San Jose, which is the nearest point on the railroad to the mines. San Jose itself is a thriving little city of ten to twelve thousand inhabitants, situated in the charming Santa Clara valley, which is the garden of the State. Possessed of a delightful climate and a most fertile soil, in which can be raised nearly everything that is produced either in the temperate or torrid zones, and so near to San Francisco that it has a good market for its productions at all times, it is a veritable farmers' paradise; and it is no wonder that its fertile bottom lands command high prices. Passing the night at San Jose, we took a team early next morning and drove out to "New Almaden," which is about fifteen miles from the city.

The mine is situated nearly at the summit of one of the foot-hills of the "Coast Range" of mountains, and was originally discovered by the Indians, resorting to this place to procure the red paint with which they smeared their faces, and which was here found cropping out of the ground. It was discovered that this material was a rich vein of cinnabar or crude quicksilver. In course of time a company was formed to work it, and, for many years, it has been one of the principal producing quicksilver mines of the world. Being furnished with a guide, we stepped into the bucket or cage, and in a moment were lowered 1,400 feet down into the bowels of the earth. Here we got out and were conducted through a long and tortuous tunnel to the point where the miners were working the vein. We found a set of swarthy fellows drilling and blasting, and filling the small cars which are run over the tramway leading out to the shaft. After witnessing their operations for a short time, and securing some rich specimens of ore,

we retraced our steps to the shaft, and were hoisted to what is known as the "1,200 foot level," and here got into a somewhat larger car than those used on the lower level, and, propelled by a mule, were soon again out in the daylight.

The reducing works or furnaces are situated down at the bottom of the hill, and, proceeding there, we were shown the most interesting part of the process. The ore is put into vast-furnaces or retorts, and roasted at a white heat for three to four days. The fumes from the furnaces are conducted through a number of little rooms known as "Condensers," in which they condense into quicksilver, and run down through channels provided for the purpose, into iron kettles or receptacles below. It is very interesting to stand by the side of one of these kettles, and put one's hands down into what seems more like molten silver than anything else. It has all the weight and seeming solidity of the heaviest metal. Indeed, so heavy is it, that if you throw a piece of iron upon it, the iron floats like a chip of wood upon water; but you endeavor to grasp it in your hand, and it slips away from you as if it were a phantom, and, after several attempts, we gave it up in despair, convinced that this was the most intangible of all the heavy substances that we had ever seen. From these kettles it is drawn off into iron kegs or "flasks," as they are called. These are about twelve inches high, and from four to five inches in diameter, yet they contain about seventy-five pounds of quicksilver, from which an idea may be formed of its great density and weight.

Much of the quicksilver produced here is used in amalgamating with, and thus collecting, the gold and silver produced in the mines of the Pacific slope; but large quantities are shipped to all parts of the world for use in the mechanic arts. China takes considerable quantities, most of which is manufactured into vermilion; for it is an interesting fact that the red color which shows in the ore but disappears in the refined product, can again be made to appear by pursuing a certain chemical formula. The Chinese are very expert at this, and Chinese vermillion has been celebrated for years. Of late, however, the universal Yankee nation have begun to manufacture vermilion; and it is now said of this, as of many other articles, that our manufacturers can "beat the world" in producing it. Of course everybody is familiar with the use of quicksilver (or mercury as it is often called) in thermometers; but its sensitiveness to heat has lately been utilized for a new purpose—that of giving fire alarms. In the Palace Hotel, San Francisco, every room has a glass bulb filled with mercury, let into the ceiling, and, in the event of a fire originating here, as soon as the heat reaches 110 degrees, the mercury rises, connects two electric currents, and the news is instantly telegraphed to the office that there is a fire in No.——

It is said that a practical joker once tied a match to the end of his cane, lit it and held it up to the bulb; in a moment the fire brigade of the hotel were thundering at his door; opening it with the blandest possible smile, he informed them that it was all right, they might go back again now, as there wasn't any fire, but he was satisfied the thing would work if there was one. The number of uses for which quicksilver is employed is constantly increasing; but the production has also largely increased, and, in consequence, the price fallen largely. Two years ago it was worth $1.50 per pound; to-day, sales were made at 40 cents, from which it will be seen that it has more than kept pace with the decline in other articles. At present prices, however, it is said that it does not pay to mine it; and, doubtless, production will soon be largely curtailed unless the price advances.

The Centennial.

CENTENNIAL FRUIT.

CENTENNIAL GROUNDS, Sept. 15.

IT is a little surprising that the Fruit Growers' Association of Ontario should in their grape selections show so decided a preference for Roger's Hybrids, while several degrees south of Ontario such various opinions exist as to their hardiness and ripening qualities. Finer specimens, however, than are exhibited of Salem, Wilder, Lindley and Agawam, are seldom seen from whatever source. Rebecca they consider their best white grape.

Of apples, the large, showy Alexander (Russian) and Kentish Fill-basket (English) the latter larger than the former, are first-rate cooking apples. An unnamed large, yellow crab, by Mrs. E. A. Taylor of London, Ont., is one of the best of its kind.

Ellwanger & Barry have 50 different varieties of plums that speak well for the effectiveness of their method of fighting curculios, viz., jarring the trees and collecting them upon sheets spread out underneath. Belle de Septembre, Duane's Purple, Yellow Magnum Bonum or Egg, Pond's Seedling, Huling's Superb, were the finest in appearance though only, for the majority, of medium quality.

Their pears as well as those of all Eastern exhibitors, show in a marked degree the effects of drought in being quite inferior in size to those of other years. All of the following are conspicuous for their beauty—most of them, indeed, for their quality as well:—Pater Noster, resembling the comparatively new and promising Souvenir du Congres, (figured in RURAL NEW-YORKER of June 5, 1875,) though smaller; Beurre d'Anjou, that well-nigh universal favorite; Hebe, a South Carolina pear beautifully blotched with red; Duhamel de Monceau, a new variety, dull-red and green: Beurre Diel, large green; Flemish Beauty; the Ohio Kirtland, resembling its parent the Seckel, though larger and somewhat less the type of what a pear should be in flavor. Their specimens of Beurre Clairgeau are fine—but so are all the Clairgeaus from whatever section, and they are to be seen in almost every collection. That this pear should have established the reputation of being sometimes poor in flavor, is not indicated by any external difference in comparing those of the different States in which they have been grown:—Sheldon; the favorite Beurre Bosc; Mansfield; Adams. Beurre Superfin is an autumn pear that, though decidedly acid, is yet of a most agreeable flavor.

We note the following additional varieties of pears that combine good eating qualities with showiness to the extent of making them desirable wherever soil and climate are favorable: Westcott, Doyenne Downing, Beurre Hardy, Catherine Gardette, Van Buren, Paul Ambre, Beurre Diel and Beurre Gris d'Hiver.

They (E. & B.) exhibit 164 varieties of Apples. Menagere is a large German winter cooking apple. Chenango Strawberry (Sherwood's Favorite) is a tempting looking apple, though ill-adapted to most places; Gravenstein, that thrives both North and South; Black Detroit and Flower of Kent, both handsome and inferior; Mother, high flavored, yellow and red, of medium size; Smith's Cider, deemed by many fruit growers one of the most valuable market varieties; Gloria Mundi (Monstrous Pippin), a coarse but handsome winter apple, good for cooking only; Twenty-Ounce Pippin (Twenty-Ounce properly) which for size and cooking qualities is perhaps as popular as any known. Summer Hagloe is showy, large, yellow and bright-red, ripening about Sept. 1st.

J. G. Ramsdell of Traverse City, Mich., exhibits fine Jefferson and Bradshaw plums, also excellent Sheldon, Superfin, Flemish Beauty and Clairgeau pears. All of the apples, as usual, of Michigan are superior—Brittle Sweet, Alexander, Lowell, Twenty-Ounce, are especially worthy of note.

The fruit growers of Minnesota speak in high terms of the Wealthy apple, which originated there. It is exceedingly showy, hardy of course, of good quality, and it seems singular that it has no record elsewhere. The Fameuse, extra plates of which are shown, does well in Minnesota. A plate exhibited by W. E. Brimhall, among others, and marked "Unknown," is doubtless this apple. The only pear that is perfectly hardy in the northern part of the State, is Flemish Beauty. Many crabs bearing names with which we are not familiar, are unusually large and perfect.

Hovey & Co. of Massachusetts exhibit 175 varieties of pears, of which Doyene Boussock, (Boussock), Sheldon, Hardy, Bosc, Clairgeau, Edmonds, the variable Beurre d'Amalis, Louise Bonne de Jersey (few of these are on exhibition), the excellent Beurre Kennes and Doyenne du Comice are the most striking.

Mr. M. P. Wilder's collection, consisting of 300 varieties, is so nearly a repetition of those of Ellwanger & Barry and Hovey & Co., with which it favorably compares, that we need not particularize. His Clapp's Favorites, however, are among the best specimens of this splendid fruit to be seen.

Among Joseph H. Fenno's pears, Flemish Beauty and Frederick of Wurtemberg are extra fine.

Edward W. Lincoln of Worcester displays extra Beurre Bosc; Newell Wood of Milbury, Doyenne Boussock. Amos Bates of Hingham, Mass., is one of the few exhibitors of the Bartlett, all of which, as of Duchess d'Angouleme, are inferior to those of other seasons.

C. E. Grant has a plate of De Tongres, a pear which, but for the tenderness of the tree, would be more generally cultivated.

F. & L. Clapp show the Clapp's Favorite in perfection. Whether we judge the merits of this fruit, the hardiness of the tree, its rapid growth or symmetrical shape, it has, in our opinion, few equals and not one superior. A seedling of theirs (No. 83) resembles Flemish Beauty, though showier. Another seedling, of which there are five upon the plate, is the shapeliest and prettiest pear we have ever seen, though the flavor does not, it is said, fulfill the promise of its beautiful form and colors. Even so, its beauty will "carry it through" and insure a ready sale.

The apples of Iowa, one of the largest collections in the building, are exceptionally fine and speak an encouraging word for the future of this State as an apple-growing country. Taking the collection as a whole, it is not excelled.

We pass over the display of California, which, if size is a first criterion, would do credit to any country upon the face of the earth. Almonds, figs, nectarines, the largest grapes, peaches and apples, utterly eclipse the fruit productions of other sections. But as soon as one sees they are from California, surprise—almost interest—ceases. Great size in fruits is curious, but the curiosity with familiarity passes away, and their value must finally rest upon those qualities which constitute the type apple, pear, peach or grape the most delicious of man's food. California's fruits do not possess in an eminent degree those qualities.

Nebraska sends numberless varieties of apples and excellent Sheldon, Flemish Beauty and Louise Bonne de Jersey pears.

The apples of Kansas are remarkable in size and in every way suggestive of the adaptation of the soil and climate of that State for their successful cultivation. Alexander, R. I. Greening, Fallawater, Yellow Belleflower, Fulton, Northern Spy, T. Co. King—of which first-rate specimens are shown—all do well in Kansas. Ben Davis, Willow Twig, Winesap and Jonathan are, however, among their most profitable winter sorts, while Early Harvest, Carolina Red June and Cooper's Early White are their stable apples for summer.

Mr. Rickets' celebrated hybrid grapes excite a deal of notice and wondering comment. We can give them at present but this passing notice. To do his collection justice would require a good, long chapter to itself.

CENTURY BLOSSOMS.

THE great drawback to appreciation is a lack of knowledge of the article under inspection. There are but comparatively few among the visitors at the Centennial who go away with very distinct ideas about the things that may have most attracted their attention. They may convince themselves of this by attempting to describe what they have seen to those who depend on the speaker for lucid accounts of the interesting or marvelous. It is difficult for a novice to ask leading questions if he has but a veneering of information concerning the subject; and it is the most discouraging of tasks to induce exhibitors and attendants to be expansive after they have parroted explanations all day to countless numbers. ELKINGTON & Co., the inventors of electro-plating, exhibited their magnificent works of art, the most prominent being the Helicon Vase, a trophy in repousse silver and steel, illustrative of MUSIC and POETRY. Like sensible men, they have had a number of printed descriptions struck off, which enables the visitor to understand the process of manufacture thoroughly, after which he can admire fully this exquisite work of art, whose value is $30,000, in gold. We quote:

This Center Piece or Vase is wrought out of silver and steel by the "*repousse*" process, that is to say the whole of the exquisite work is hammered out of the flat silver entirely by hand, and is further enriched with damascened tracery in gold and silver. It is beyond all comparison the most important work of high art ever produced by Elkington & Co., and has taken six years in manufacture. It ranks as the masterpiece of the eminent metal sculptor, M. Morel Ladeuil. Many and important as are the works which have issued from the hands of this accomplished artist, from his "silver table" to the Milton Shield he has never before achieved anything approaching in beauty of design, fullness of elaboration, and mastery of technical execution, to this noble allegorical composition, in which are embodied, we understand, the fruits of nearly six years' unbroken application. The general form of the design, which is in the style of the Italian Renaissance, and devoted to the apotheosis of Music and Poetry, may be described as an elongated plateau enriched with sculptured plaques or panels, and supporting in its center, between two seated figures, a tall and stately Vase.

The Vase, which is of ovoid form, with upraised handles gracefully continuing the curve of the sides, is surmounted by a charmingly posed group of two boyish genii, the upper one bearing aloft Apollo's lyre, which forms the apex of the work, while the youth at his feet tests the purity of the strain with a tuning fork. A floral garland on either side connects this group with the handles of the Vase, and adds strength to the composition. On the body of the Vase, on either side, are large medallion reliefs in *repousse*, representing the Nine Muses, four on one side and five on the other; and the bases of the handles are covered by scutcheons bearing the names of illustrious poets and composers—Homer, Shakespeare, Moliere and Byron on the one, and Handel, Beethoven, Haydn and Mozart on the other.

Upon the pedestal on either side, facing the extremities of the plateau, are seated large, semi-draped female figures, symbolizing Music and Poetry, and either nymph is attended by a youthful genii, whose action dramatically supplements the indications afforded by the pose, expression and accessories as to the character and pursuits of the principal figure. Upon the shelving base of the pedestal, on either side, is an oval bas-relief, occupied, the one by a spirited representation of Pegasus bearing a genii typifying Inspirallon, the other by a griffin or hippegraph, carrying the genii of Imagination.

Upon the sloping surface of the outer border of the plateau are a series of twelve bas-reliefs of various shapes, illustrative of the various descriptions of Music and Poetry, six of each kind; and the interstices of the design are filled up with masks, scrolls and trophies of various kinds in beaten and oxydized silver, which is everywhere thrown up in admirable relief by the ebony black ground of the damascened steel, which forms the framework and setting of the composition.

No words can well convey the chaste and harmonious beauty of the work, the charms of which, unlike those of modern metal work in general, are essentially sculpturesque as opposed to chromatic, and derived from elegance of form rather than from surface decoration. The modeling of the detached figures throughout is simply superb, combining the rare proportions and matchless symmetry of classical forms with French *esprit* and grace; and the figure work in the bas-reliefs, in which nymps, cupids and satyrs seem to be invested by the artist with an individuality and expressive power rarely found in such conventional embodiments, is scarcely less meritorious.

REV. E. M. LONG is superintending a movement to furnish visitors with good accommodations at low rates. He assigns them to houses of private families, of which he has a large list. The merit of the plan consists in the fact that respectable people can visit the Centennial without the danger of mixing in a promiscuous crowd. This is a great advantage to ladies, for instance, who cannot command a male escort. Prices range from $5 to $14 per week. Mr. LONG can be reached by letter. Office, S.W. cor. of Twelfth and Berks. The plan appears to meet with favor.

THE proprietors of the London Graphic, an illustrated journal, make a very curious and interesting display of the various processes they use in producing their paper. Some very fine examples of wood engraving are shown, but the most interesting feature is a collection of original sketches portraying scenes that subsequently appeared in the paper. There are sketches that were taken on the field of battle; that were sent by balloon post from Paris during the siege; that came across the Pyrenees whilst the Carlist war raged, etc.

THE automatic envelope machine, in the Main Hall, is a curiosity. It makes out of a sheet of buff paper, that unwinds from an endless reel, 145 envelopes a minute. The paper is cut, shaped, folded, pasted, fastened gummed, and the gum dried, all by machinery—which finally delivers the envelopes all done up in neat packages. One girl attends the machine.

THE French are in a terrible rage about the recent conflagration in a building near the Exhibition, by which a great number of the expensive boxes in which the pictures, statuary and other objects of art were transported hither were burned. Although the money loss by this fire is quite large, this is not what chiefly annoys the French, but they declare that the fire was the work of an incendiary.

A GREAT crowd continually forms in the picture rooms and galleries of marble statues, in Memorial Hall and the art annex; and, while the exhibition, as a whole, falls far short of what it should be (France, especially, doesn't contribute what she should), yet there are many valuable paintings and statues. It would take more than one day to see the whole.

AN interested crowd hangs about the west side of the great water tank, in Machinery Hall, where, almost under the big and little pipes that pour their constant stream from a hight of forty feet down into the tank, there are fan-blowers shown—machines for exhibiting the force of compressed air. One mine ventilator is exhibited.

THE violent storm of the 17th Sept. knocked some glass out of the Main Building, and considerable damage was done to the English and American exhibits.

THE largest specimen that was exhibited in the dog show weighed 167 pounds, and the smallest 2½ pounds.

DON'T fail to see the display made by the famous London silversmiths, ELKINGTON & Co.

AMONG the animals in the live stock show is a ack from Malta.

Floricultural.

BULBOUS PLANTS.

Tulips and Hyacinths, if they bloomed in the richest floral season, early summer, would be deemed as showy as the showiest of the plants then blooming. But when it is considered that they begin blooming in early April, when other things are only beginning to bud and the country shows only the first green tint of verdure, it is as if one's garden, without them, lost two weeks of spring, and that, too, at a time when, from long and patient waiting, we are ready to seize upon the first violet with a freshly-awakened enthusiasm that, as flowers become more numerous and the season wears on apace, is prone rather to pall than to increase.

Spring bulbs, to produce their best effects, should be planted in quantities. A scattered Hyacinth or Crocus here or there looks lonely, cold—looks as if it were an escaped hot-house subject that was in danger of freezing to death, and we are the more inclined to think of "The last Rose of Summer" than of the sturdy flowers of spring that the frosty air will harm not at all. If we have but a few of such bulbs, better grow them in the house, to enliven the window or conservatory through mid-winter. But the effect of many spring bulbs blooming together in the same border is very different. We may then feel that they are quite at home; that they are proud of their brilliant colors and conscious of the pleasure they afford us.

Instead of planting Hyacinths, Tulips, Crocus, Crown Imperial, etc., in beds from which later in the season they must be removed, or else injured by the introduction of bedding-plants to fill their places, would it not be a good plan to plant together in one larger plot all plants of the Lily kind, there to remain undisturbed for several years in succession? Such a plot would give flowers of one species or another from early spring until frost. First, about the 1st of April, we should have the bright, though short-lived, flowers of the Crocus, white, yellow, blue and striped, lasting until the first of May, and at the same time the Snow Flakes, *Leucojum vernum* and *æstivum*, the latter taller than the former; the Winter Aconite, *Eranthus hyemalis*, and the yellow Adder's Tongue, *Erythronium Americanum*; the Roman Hyacinth, far less showy than the later Hyacinths, but blooming ten days earlier. Then the Hyacinths of all colors are added in early May—the early Tulips; then the Double and Parrot, and finally the late Tulips, prettiest, perhaps, of all; the Crown Imperials, blooming the 1st of May; the Narcissus, and, in sheltered spots, the Anemone and Ranunculus.

Among the earliest and most showy of summer Lilies is *L. umbellatum*. It flowers in the middle of June. They are erect in umbels four inches or more across, of a dark orange color, and the bulbs so increase in two or three years as to produce masses of bloom two feet in diameter. We call particular attention to this Lily from the fact that with no care beyond that of weeding, it never has failed us in ten years.

Next, those known as Japan Lilies or *lancifoliums* (*speciosums*, *album*, *roseum* or *rubrum*, *punctatum*) are, for this latitude, to be prized. They begin blooming first of August, continuing until after frost. *Lilium auratum* and several of the distinct varieties that have sprung from it are, no doubt, the finest or all hardy Lilies; but they are more liable to disease and, left to themselves among other bulbs, will, as a general rule, grow beautifully less from year to year and finally disappear. Nevertheless, we should have it even though obliged to buy new bulbs every fall or spring. *L. excelsum* (*testaceum*) likewise, though as hardy as any of the others, does not thrive well under ordinary treatment. One year we raised this Lily with a stem five feet two inches high, not over *one inch* in diameter at the base, and bearing six of its recurved buff flowers a little larger than those of our *L. superbum*. The next season it grew one foot high—and the next was dead. *Chalcedonicum*, the scarlet Turk's Cap, the most wax-like of Lilies, of a crimson color, blooming in July, and *Brownii*, with its long, trumpet flowers, purple without, white within, are choice bulbs, which, however, as far as we are aware, have never been grown with success under the conditions of which we speak. *Longiflorum* and *Candidum*, the double-flowering Tiger, our *superbum* and *Canadense* will, however, seldom fail us, and, together with the others mentioned, may be relied upon for a bed of constant bloom from the latter part of March until hard frosts.

Let us, in arranging a plot of this description, plant also the Iris that is now being offered by our florists in many delicate colorings quite new to our gardens. It would seem almost impossible that so beautiful a flower could ever have become so entirely neglected. But the later varieties are destined to change this, and we anticipate that at an early day both these, as well as the old-fashioned sorts, will again become as freely used as are now Gladioli and Japan Lilies. There are many varieties, the following of which we have selected as being perfectly hardy and presenting a pleasing and diversified range of colors:

I. flava, *Admis*, *florentina*, *Smithi*, *Cleopatra*, *Formosa*, *Orpheus*, *plicata ventricosa*; also, *Xiphium* (Spanish), *Xiphioides* (English) in variety—and *Persica*, *Susiana* and *tuberosa*.

Funckias, *Hemerocallis* and *Tritoma uvaria* are well suited to such a combination. Most persons remove the Tritoma (Red-hot Poka) to the cellar in late fall, knowing that it will not stand severe winters. In the fall of '74 we covered them with mounds of sand, placing manure over these. They thus passed through the terrible winter of '75 uninjured. After so exceptional a test, we have little fear as to to their hardiness when thus protected. It is less trouble than to remove them to the cellar and look after them now and then through the winter.

A bed for the reception of specimens of the Lily-like plants we have recommended would need no labored preparation. If the soil is good, spading a foot deep and adding plenty of sand to make it light are chiefly needed. So arranged this fall, it might so remain for three years, increasing in beauty all the while, when all should be dug up, new soil supplied, the bulbs separated, fresh Hyacinths procured (they are worthless after three seasons) and a general reconstruction effected.

The preparation of this bed need not be begun until after frost and when the garden has lost its summer appearance. The bulbs (and roots) may be procured and planted at any time before the ground is frozen. The whole should be protected, at least for the first winter, with a covering of about three inches of clean manure, *not* to be removed in spring, but to remain and become incorporated with the soil.

Of all spring bulbs the Hyacinth is the most showy and perhaps the most trustworthy for house cultivation. We give the following sententions but explicit rules that, if acted upon, can hardly fail to produce pleasing results:

1. Select the heaviest bulbs; a small, heavy bulb will develop stronger roots and a more compact raceme than those which are larger and lighter.

2. If glasses are used, fill them with pure rain water, so that the bottom or plate of the bulb barely touches it. Fill the bottom of the glass with bits of charcoal; the changing of the water, which sometimes entangles or breaks the long, slender roots, will then be unnecessary.

3. Place the bulb in a cool, dark closet, or in the cellar, until roots have grown two inches or more, and then gradually introduce to the light, always, however, avoiding bright sunshine. According to most instructions, the bulb should remain in the dark until the roots have extended nearly or quite to the bottom of the glass. This, speaking from our own experience, is a mistake. The roots of bulbs, like those of other plants, in a measure, are assisted in growth by the leaves, and if we retard the latter too long, the roots draw too much sustenance from the bulb, which is but a hypertrophied stem, and the inflorescence is impaired accordingly. Some bulbs will emit roots in a few days; others require six weeks.

4. The single kinds are generally preferred for glass and water culture. We prefer them for out-door culture as well, though the double varieties, being later, add a few days to the Hyacinth season.

5. A temperature not over 65° and a moist atmosphere are desirable. Fill the glass with water as it evaporates.

It is better to grow all the spring bulbs in *soil*, which supplies elements of nourishment which water does not. It is only necessary to collect light soil, secure perfect drainage, place in the cellar or other dark, cool place until the leaves begin to grow, and then inure to the light.

Cyclamens, though little known as compared with Hyacinths and Tulips, are among the prettiest of bulbous plants for winter culture. They are of extremely delicate colors, short-tubed, with lobes so twisted as to resemble a shuttlecock. *C. Persicum* is the species most in favor for house or conservatory. The hardy *Gladiolus*, many of the *Iris*, the Snow-Drop, Ixia, Crocus, Oxalis, Narcissus, Jonquil, are all suitable for winter flowering. AN OLD GARDENER.

HYDRANGEA.

EDITOR RURAL NEW-YORKER:—All the species of the Hydrangea mentioned in my communication of last week, I cultivate on my own grounds. They are perfectly hardy, with the exception of the variety *Hortensia*, which requires protection during the winter. Properly protected, the latter stands the cold winters very well with me and some of my neighbors. Of the *Hydrangea paniculata*, I have on my lawn some twenty-five plants, one of which, under special care, has attained the hight of seven feet, and no doubt will be eight feet by next season. This specimen has now some ninety panicles of flowers, one of which, by measurement, is fourteen inches in length, and I believe that they can be forced to measure eighteen inches in favorable seasons.

W. R. BERGHOLZ.

[Our correspondent's first communication upon Hydrangea reads, "If grown out-of-doors it (*H. Hortensia*) requires *some slight* protection during the winter months."

The present one speaks of it as hardy when "properly protected." Our own experience is such that we are constrained to believe that our friend will have occasion to change his mind. Certain it is, however, that we have never been able "properly" to protect ours. *Hydrangeas paniculata alba*, in the RURAL grounds, are no taller this season than last. Perhaps the drought has dwarfed them. We have no opinion as regards how large their thyrses may be grown by forcing it. No reference is made in his first article to special culture.—ED.]

SEEDLING GRAPES.

LAST year we suggested to some of our friends that they save the seeds of fine grapes and plant them for room cultivation during the winter. Use 3-inch pots—2 seeds to a pot, sown a quarter of an inch deep. If both germinate, pinch one out. In the spring, after frosts are past, thump them out into the ground. They will continue to grow during the summer, and will perhaps fruit the third year.

It would seem a more economical method to sow in boxes. But in this case the roots will be disturbed in transplanting; the vines then generally lose their leaves, and are slow to recover. Thumped out from 3-inch pots, the roots are not disturbed and no check is experienced.

Around the Republic.

FROM OLD CONNECTICUT.

DEAR RURAL:—What is more impressive than the stillness of a country village at midday? It is now noon; the strokes on the bell of the clock at a neighbor's, just across the green, come to me with a surprising distinctness. The crowing of a cock in a distant barnyard is as clear as if but a few rods away. The whistle of a locomotive, "over the mountain, far away," might readily be supposed to be no more than a mile off. The laughter of distant playing children seems as if in the lawn under my window. All nature is in repose; the leaves on the trees seem afraid to rustle—silence is the rule; noise, the exception.

"Now comes still evening on" was not written for this latitude. Here, as the shadows lengthen, activity increases. Half past four is train time, and from then till dark, carriages are almost constantly in sight—some to meet passengers at the station, some to the stores and post-office, some returning from market, some with riders for pleasure, and some (but these a little later—after tea,) with young lovers, for the young people do say there is no better place to tell the tale of tender passion than in a narrow-seated buggy on a moonlight night, with a horse that seems to know his business and isn't over-anxious to get home.

As the sun descends, croquet parties are formed, and sounds of the rapping of the mallets, the concussion of balls, and the hilarity of players, come from all directions. And soon the laborers are returning from their work, and "the lowing herd winds slowly o'er the lea."

As twilight comes, the insectivorous world awakens, and, before bed time, the crickets chirp, the katy-dids rasping contradiction, and the tree-toad's inharmonious note are making more noise in a minute than all nature contributes to the noontide hour.

One of the strangest things to me, in connection with life here, is, that people give so little attention to small fruit culture. A few currant bushes are occasionally seen; but it is an exception when you find strawberries, blackberries, raspberries, or even grapes. One day's work in a year devoted to each kind of berries would furnish a full supply for family use; and one-half that time devoted to grape culture, would insure more than a sufficiency. Occasionally a vine, transplanted from the neighboring woods, is seen, planted as much for shade as fruit; but it seems to be forgotten that there are now good varieties, which are as easily cultivated as the natives—entirely hardy and more productive, as the Concord, Hartford Prolific, and others which, after setting, require only training and pruning. The berries are not quite so easy of culture; but a strawberry bed, four rods square, can be set and taken care of with but very little trouble, and a row of Kittatinneys or Lawtons, of Philadelphias or Antwerps, sufficient to produce all that are needed for the table, and to prepare in different ways for winter's use, require less labor and, as I said, the neglect to cultivate these luxuries is, to me, unaccountable.

Centennial cushions are the furore among the ladies in this vicinity. A piece of working canvas of suitable size is selected, in the center of which the owner works such designs as is considered appropriate, usually combining in some way the figures of 1876, with a shield, flags, or other national emblems. It is then sent to friends, who, in succession embroider such little design as they may choose—a letter, rose bud, anything of small size and with total disregard of order as to position. When the canvas is nearly covered with these designs, the vacant spaces between them are filled in and the cover for the cushion is ready.

Whatever this village may be wanting in, it is not in postal conveniences, as four incoming and five outgoing mails daily sufficiently attest. This, for a rural population of 1,500—a considerable number of whom get their mail matter from other offices—must be considered ample. When I was a boy we had but three mails each way in a week. Then, I think, there was not a single daily paper taken in town, and but one semi-weekly. Now, I am told, there are about forty dailies and weeklies in number proportionate. This speaks well for the reading habits of the community, and I think there is no doubt the country people, as a class, are better posted, relative to the general news of the day, than are those of the same intellectual caliber who reside in larger towns or cities.

Situated so near the city—only six miles away—considerable attention is given to supplying milk and butter for that market, and the farmers are beginning to learn that there is much difference in cows and that the best ones are the most profitable. Grade Alderneys seem to be favorites, and of these there are many first-rate specimens. I endeavored to investigate, to a small extent, the comparative profit of milk-selling and butter-making, but as I could not with much inquiry find a person who could tell me the average quantity of milk used to make a pound of butter, I gave it up.

For working cattle, of which many are used, I find the old red New England breed are still the favorite. Large, strong, gentle, tractable and good walkers, in the hands of a good trainer they are about as good as can be. And will you believe it? the farmers are beginning to learn that oxen are not deaf. The best trained pair I ever saw, obey readily when the voice is raised no louder than in ordinary conversation.

My play time for the year will close in a few days, and this is the last letter I shall send you. In another week I shall again be amid the hurry and bustle of the great city, when the quiet of the country will seem more like a dream than a reality. But I have had quiet and rest; and let those who will, choose the galeties of Nahant, of Long Branch or of Saratoga, or wander among the wildernesses of the Adirondacs or the Lakes of Maine—for me there is more rest here than elsewhere on earth; and, if ever the time shall come, as come it may when this old homestead, my birthplace, shall pass into the hands of strangers, and none of kith or kin shall be here to welcome me, then will a bright light be stricken from my firmament and a shadow fall across my pathway. L. A. R.

Bloomfield Conn.

Entomological.

THE WESTERN LOCUST.

PROF. CHARLES V. RILEY, writing to the Weekly Tribune, gives a very thorough and exhaustive article on the operations of the Western Locust the present year. As we cannot find room for the entire article, we make a few extracts which are probably of most general interest:

"The continued ravages of this locust pest will, it is hoped, bring our legislators to a realizing sense of their obligations to Western farmers. Feeling the importance of the subject, I made every effort last winter, with the assistance of others, to get Congress to enact a law which would cause a thorough investigation of this locust matter and of some other entomological matters of national importance. The effort was warmly seconded by the people of the Western country, which most suffers; but many good Eastern people, in their narrowness, could see in the effort only another attempt to get somebody an office, while the Department of Agriculture, or rather its head, instead of encouraging, as it should, all efforts of the kind, looked upon the movement as an interference with its own work, and used its influence to impede and prevent action.

"I am glad to see that Gov. Pillsbury of Minnesota has considered the matter of sufficient importance to suggest a conference of Western Governors. He informs me that this conference will probably take place about the middle of October, and let us hope that since there seems little chance of assistance from the National Government, the Western States will do what in

human power lies to overcome this evil. It also gives me pleasure to note that immediately upon the arrival of the insects into Iowa, Prof. C. E. Bessey of the Agricultural College issued a bulletin composed of the more practical passages from my last report. I hope, with him, that by being scattered over the State it may do some good.

"In closing, let me say a few words as to my own position, since it is being very much misconstrued. The fact that my predictions for the past two years have been fully justified by subsequent events has led too many people to attach too much importance, perhaps, to my opinions; and now that the last hope expressed and opinion given—viz., that the locusts might not, and probably would not, overrun the Western States again this fall—have proved unfounded, there is a tendency on the part of some editors to unjustly censure. The following paragraph has passed from paper to paper and formed the basis of unwarranted criticism:

"'Prof. Riley, State Entomologist of Missouri, who has spent considerable time in studying the habits of the grasshoppers, says that not only will there be no locusts in Missouri, Kansas and Nebraska this year, but that the ordinary batch of the indigenous grasshopper and other destructive insects will be less than usual, the only exception to this being the borers.'

"The paragraph originated, I think, with the Salina (Kan.) Journal, and the editor had evidently no intention of misconstruing. Yet any one who will carefully read what I really wrote in the Tribune of last January, and in my eighth report, in discussing the prospects of the year, will see that there is much misrepresentation. As an offset to many sensational rumors and forebodings made last winter, here is what I really wrote, some passages being italicized to indicate wherein the above purported opinion is unjust:

"'I give it as my belief that, first, in the three States mentioned (Missouri, Kansas and Nebraska), there will not hatch as many locusts next spring as would naturally hatch in ordinary seasons from the indigenous species; second, that, compared with other parts of the country, those States ravaged by locusts last spring and early summer will enjoy the greater immunity during the same seasons of 1876, not only from local injuries, but from the injuries of most other noxious insects, except the wood borers. In short, the people of the ravaged section have reason to be hopeful rather than gloomy. *They will certainly not suffer in any general way from locust injuries in the early season; and the only way in which they can suffer from the migrating pest is by fresh swarms later in the year from the far Northwest*, the odds being, however, for a number of reasons which it is unnecessary to enumerate here, very great against any such contingency.'

"I thus distinctly gave my opinion that Missouri, Kansas and Nebraska (having considered Colorado and Minnesota separately) would not suffer in the early season or in spring and summer, admitting, however, the possibility of fresh invasions in the fall, though considering such improbable. Every one knows how fully the first opinion has been justified by the events, and that the second has not, shows how imperfect our knowledge yet is of the native breeding-places of the pest. The season in the Northwest has been very dry and favorable to locust development, and I freely confess that an invasion such as we have had during the month (only two years after the general invasion of 1874) was not expected by me, and is indeed without precedent. I am naturally inclined to take an optimistic view of the subject, for the reason that such a proneness to exaggeration prevails; but I desire not to be placed in a false light, and hope that the Colorado Farmer and other journals that have taken purported but inaccurate reports of what I did predict, for text on which to build complaint, will make due *amende*."

Domestic Economy.

TO "YOUNG HOUSEKEEPER."

Picalilli Pickles.—Use cabbages, cauliflowers, cucumbers, green tomatoes, a few green peppers, radish-pods, onions, beans and nasturtiums. Pull the cauliflower apart in small pieces; slice the cabbages, peppers and cucumbers. Put all into strong salt and water for twenty-four hours; then drain thoroughly. Take a few of the vegetables at a time and scald in boiling vinegar; when all are scalded, mix in a bountiful supply of white mustard seed and pack in jars. To each gallon of good cider-vinegar, add a quarter of a pound of green ginger, two ounces of allspice, one ounce of cloves and three pounds of sugar; boil slowly for thirty minutes; then remove from the fire. Mix six ounces of ground mustard (for each gallon of vinegar) smooth in a little cold vinegar and stir into the spiced vinegar; pour the mixture hot over the vegetables. In two or three days examine the jars and see if the vegetables are covered with vinegar, if not, add cold vinegar. Seal up and set in a cool place.

MRS. RUSTIC.

CORRECTION.—In the Original Recipes, Sept. 16, for "Brandy Peaches," sixth line should have read, "Make a sirup of three-quarters of a pound of loaf sugar, and to each pound of fruit add," &c., instead of as it appeared in print.

SELECTED RECIPES.

Sweet Grape Pickles.—To eight pounds of fruit use four pounds of sugar and one quart of vinegar. Place the fruit in jars. Boil and skim the sirup and pour over the grapes boiling hot; repeat this process three or four days. Then seal up and set in a cool, dry place. Boil any kind of spices in the sirup that suits the taste.

Grape Marmalade.—Boil the grapes till very soft, then strain them through the sieve; to every pound of pulp obtained use a pound of sugar. Boil these together slowly for twenty minutes, stirring constantly. When cool, dip out into small glasses and cover with paper dipped in brandy to prevent mold from coming on top of the marmalade. Keep in a dry, dark and cool place.

Sweet Crab-Apple Pickles.—Put the crab-apples in a preserving kettle, with good vinegar enough to cover them, and cook until tender. Then take them out of the vinegar and put them in jars. Measure the vinegar, and to each pint add one pound of sugar, cloves, cinnamon and mace. Tie the spices in a bag and boil in the sirup a few minutes. Pour the sirup hot over the fruit; then seal up and set away for use.

Nasturtium Pickles.—Take green nasturtiums; put them in strong brine for twenty-four hours; then drain thoroughly. Put them in glass jars and cover with cold cider vinegar. Spice may be added, if preferred, but it discolors the pickles.

Mangoes.—Take small green melons, cut them lengthwise, so as to take out the seeds, and put them into a strong brine. Let them remain in it two days; then wash them off in fresh water. Prepare horseradish, stripped in small pieces, cucumbers of the smallest size, nasturtiums, mustard-seed, sliced-cabbage and sprigs of cauliflowers. Fill the melons with these, and tie the halves together with twine; lay them closely in a jar or tub and pour scalding vinegar over them, in which are a few bird peppers. Cover closely.

Pickled Eggs.—Boil the eggs hard; remove the shells, and lay the eggs whole in glass jars; scald the vinegar with any spice to suit the taste; add a little salt; pour over the eggs when cold. If preferred, mix a little ground mustard in the vinegar when cold.

Pickled Artichokes.—Wash the artichokes; put them in strong salt and water for four days; then take them out, wash in fresh water and wipe dry. Put them in jars; add to them a few whole cloves, allspice and mustard-seed. Boil the vinegar and pour over the artichokes hot; cover closely; repeat the pouring hot vinegar over them until they seem a little soft.

Hygienic Information.

ABOUT FOOD.

A CORRESPONDENT of the Scientific Farmer gives the following sensible advice to farmers about exercising a little common sense in feeding themselves.

The stomach is, however, largely the key to health; for it is through this organ that all the nutriment of the system must pass, and all the force taken with the food must be transferred. We must therefore consider the demands of a healthy stomach. This organ becomes habituated to a system. It secretes the fluid which in part disorganizes the food and digests. Now, so long as this organ is in order, man appears to get the better of his surroundings. So long as the facility to digest is present, ill health need scarcely be feared. How important then to guard this important organ against damage! What the farmer requires is regular meals, and that slowness of eating which allows the food to be masticated before being swallowed. He must guard against surfeit, because he works at times hard, and hard work on an overloaded stomach is shown by experience to be injurious; yet he must eat abundantly. In this respect, as in the work on his farm, he should use common sense. Then as to the character of the food. Let him avoid the habit of tea drinking or water drinking in excess at meals. If he must drink largely, let him take other times. Eat plain or rich food, but in moderation. A swallow of meat, and a whole pie is scarcely as healthful or as nourishing as a swallow of pie, and a large chunk of meat. It is not so much what we eat which is injurious, as the manner and proportion; and a little common sense here also will go a great way. It is only necessary for the family to *think*, to increase the comforts of life; it is but necessary to apply *thought* to produce most radical improvement in the family and without. The thinking farmer should be the rule; and when once the rule, we need fear but little but that he will take his proper place in the community; honoring and being honored, healthful and contented.

MOCK INVALIDS.

IF any of our readers have been so fortunate as to miss an acquaintance with persons whose portraits are faithfully drawn in the following from the London Liberal Review they ought to be happy, and consider themselves exceedingly fortunate:

Now, of the mass of people who are persuaded that they are invalids, and demand to be treated as such, it is not too much to say that they would be all the better if they received a thorough shaking-up occasionally. That they should be so treated is not only desirable in their own interest, but in that of other people. It must be remembered that the mock invalid is invariably not only a torment to himself, but a constant source of aggravation and annoyance to others. Though he sees a dreadful significance in his own peculiar ailments, he seems utterly unable to imagine that any one else can be so unhappily situated as he is. When he is assured that exposure to certain influences would undoubtedly bring about his death, and that hard work would utterly prostrate him, he seems to labor under the pleasing impression that his neighbors can stand anything, and that the more they knock about the better it is for them.

Thus, he will not hesitate to impose heavy burdens upon people who are really weaker than he is, and justify his conduct by the pleasing reflection that they whom he thus treats are practically made of cast-iron or something of the sort. This, unfortunately, is not all. He is prone to display unreasonable irritation if those who are around him fail to show that they are deeply touched by the contemplation of the infirmities with which he has been pleased to credit himself, but which they fail to see in the strong light that he does. Enter a room in which he is sitting and omit to close the door; talk above a whisper when he happens to have the headache; innocently mention that he has left something undone, the performance of which would not have involved much hard labor, and you will soon find this out. That you will be delighted at the discovery is not likely, but at the same time you are sure to feel that you would be considered a brute if you returned his unreasonable display of irritation in kind, and so restrain your feelings.

Perhaps, indeed, after due reflection, you bestow additional sympathy on him on account of his ill-humor, which you lay to the score of the maladies that afflict him rather than to that innate perversity of nature which he has done his best to cherish. Thus, he is not encouraged to cease wrapping himself up in himself. On the contrary, he is induced to continue in the belief that he is a poor, suffering martyr, who should be the recipient of sympathy at all hands, albeit that he selfishly has no tender thought for mortals who are much more afflicted than himself. Let him then be taught that he does not stand alone; that he would be all the better if he were coddled a little less; and that because a man fancies that he is a tender flower he has no right to constitute himself an affliction upon society and a burden to his friends. Treated thus, he might in nine cases out of ten discover that, after all, he enjoyed fair health. We are encouraged to believe this because many habitual mock invalids, notwithstanding their sufferings, contrive to live to a good old age.

TRANSPLANTING HAIRS.

HERE is some good news for beardless youths and the bald-headed old men, provided it is all true and good workmen can be secured:—An interesting paper on this subject appears in the *Zeitschrift fur Biologie*, from the pen of Dr. Ernest Schweninger of Munich. He gives the following as the result of his numerous experiments:—First, that the hairs that have been recently extracted, and to the root of which cell-layers of the root-sheath still remain adherent, if brought in contact with freshly granulating surface, are capable of contracting adhesions with this, and from this point a process of skinning over may commence, as after cutaneous transplantation.

HYGIENIC NOTES.

Cure for Hiccough.—One drop of essential oil of cinnamon on a small lump of sugar, which must be kept in the mouth until dissolved and then gently swallowed.

Another.—A teaspoonful of vinegar will generally give immediate relief in the most obstinate hiccough.

Earache.—Take a bit of cotton batting, put upon it a pinch of black pepper, gather it up and tie it, dip in sweet oil and insert into the ear. Put a flannel bandage over the head and keep it warm. It will give immediate relief.

Dysentery.—I have known dysentery in its worst form to be cured, after other medicines had failed, by drinking wheat flour stirred in water, in quantity of about half a tumbler of water, made to the consistency of cream with the flour. It may be advisable to add a pinch of salt, or the flour may be eaten in its dry state. The same effect is produced in cases of chronic diarrhœa.

Quick Prescriptions.—Prof. Wilder of Cornell University, gives these short rules for action in case of accident:—For dust in the eyes avoid rubbing, dash cold water in them; remove cinders, etc., with the round point of a lead pencil. Remove insects from the ear by tepid water; never put a hard instrument into the ear. If any artery be cut, compress it above the wound; if a vein is cut, compress it below. If choked, go upon all fours and cough. For slight burns, dip the part in cold water; if the skin be destroyed, cover with varnish. For apoplexy, raise the head and body; for faintness, lay the person flat.

Insurance Department.

ADVERTISING FOR BUSINESS.

THE life insurance companies reporting to the Insurance Department of this State had in force on the first of January last less insurance by nearly two hundred millions of dollars than they had on the same day three years ago. The loss of policies and insurance which equals in amount the total insurance of all the companies in 1862, does not portend immediate ill consequences. The companies are, in the aggregate, rather stronger, financially, than they were before. The loss of policies except by death, or maturity, does not necessarily imply a loss of money by the company, for if they have been in force some years the company gains something by their lapsing. The trouble to be apprehended comes from the inevitable increase of death losses where the places of the dead are not promptly filled by new and healthy members. Heretofore this infusion of new blood has been readily obtained; the losses have been small and the dividends to living policy holders correspondingly large. The increasing difficulty of enlisting new members promises to reverse this favorable condition of affairs, and the companies that do not desire, or are not content to endure the consequences of continued inactivity, have no alternative but to reach out for new business. Whatever the necessity the prospect is not alluring.

The people who have been heretofore the best patrons of life insurance manifest a reluctance which cannot be attributed to lack of means. They increase their property, and fire insurance prospers despite the universal shrinkage of values, but they decline to insure their lives, though their reasons for doing so increase with the uncertainty of all other investments. There is a potent reason for all this which appears to have been overlooked. Impairment of confidence is, we believe, confessed; but it is less a loss of faith in the stability of the companies and the necessity of the protection they promise, than is generally believed. They have lost confidence in the agents who assume to teach what they have not first learned. They have lost faith in promises which have been perpetually broken. They have lost faith in their own competence to deal intelligently with a problem they have no means of solving. They do not understand life insurance; they have no faith in the agents' tuition and cannot be taught by them. The companies that expect their patronage must supplement the usual methods of advertising, with intelligible descriptions of their plans and practical workings. These must appear in the newspapers that are *read* by the people and that have by devotion to the popular interest in this matter earned and obtained popular confidence. Standing advertisements in such a paper are as indispensable as a sign-board to a business house. They familiarize the name of the company and the idea of insuring until these ideas become associated.

Something more is needed to enable the reader to become a willing applicant for insurance and a faithful policy holder thereafter, and that is to utilize the means at hand and the opportunity to instruct him, to acquaint him with his prospective relations to the company, his duties, obligations, privileges, benefits, and generally all that concerns the partnership he is invited to enter into. This duty cannot well be intrusted to agents and canvassers, but falls within the province of those journals which have gained public confidence and are intent to retain it unimpaired

"PROGRESS AND IMPROVEMENT."

PRICES ARE FALLING!

THE PRICE OF

THE RURAL REDUCED TO $2.50

TO SUIT THE TIMES.

Club Prices Reduced Proportionately.

Mindful of the great encouragement which has been extended to us in our efforts to improve THE RURAL, *we have concluded to show our appreciation of the same by reducing the price of* THE RURAL *to $2.50 per year,*

POSTAGE INCLUDED.

By doing this we ourselves pay the postage, which has heretofore been paid by the subscriber. In addition to this, we inaugurate a graduated scale of prices for small clubs, so that all who send names with their own, up to ten, can get a reduction for each name so sent. And for a club of ten or more, a beautiful premium in addition. Now that THE RURAL *has come down, let each subscriber send with his or her own name that of at least two neighbors. Those who wish to become new subscribers or agents can receive Specimen Copy and Premium List free. Address*

THE WAR OF INDUSTRIES.

MUCH has been written of late years by naturalists, in regard to the "war of races" among plants and animals. There appears to be a constant and never-ending struggle going on between different races, and the strongest, either in numbers or in individual vitality, generally conquer—or, to use a common phrase, results in a "survival of the fittest."

Admitting that this is the law of nature among both plants and animals, it is questionable if it should be obeyed or permitted to have full sway among the different classes of an intelligent race of human beings. We may rejoice to see a superior race overcome an inferior, or at least gain the ascendancy in the struggle for existence; but there should be a limit to antagonism in order to save both from annihilation. The dependency of one race of beings upon another, is far greater than most persons suppose, else we should hear less seldom the expressed wish that certain ones could be totally destroyed and swept from the earth. In fact, it may be surmised that man in his ignorance would, if he had the power, kill every "goose that laid golden eggs." The old story of the man who wished "everybody but himself and son would die, in order that he might have no competition in keeping tavern," is a fair example of the reasoning powers of many a man who attempts to lead public opinion in matters of trade or business.

It is not long since that a writer in one of our Western exchanges, urged the importance of giving all the trade to certain dealers in order, as he said, to lower prices and break up a monopoly. There was to be one doctor, one grocer, one hardware merchant, and so on, in the said city; all competition in this way was to be broken down, and ninety-nine out of every hundred persons who are now consumers were to be driven into the fields and become producers, and in this way our would-be-wise man hoped to increase the price of farm products.

Now it would seem to us that the proper way to increase the price of any product is to increase the number of consumers or lessen production. Fifty merchants in the city, each with a dozen clerks, will certainly demand of the farmer more of his products than one, with a hundred clerks and assistants, and the same is true in every other branch of trade. Would it not be better for the farmer, if he wishes to increase the price of his products, to discourage others from entering the same field than to encourage competition, but say to those in other industries, stay where you are and not come crowding in among us? Making war upon the residents of cities and villages, either by word or deed, is an attack upon the "goose" which consumes and pays for her food with golden eggs or greenbacks.

The farmer, however, is not the only man who is inclined to think that he alone suffers at the hands of those with whom he is obliged to deal. In every department of trade—in all the various industries—there is a continual strife to see who shall obtain an advantage. The employees in our manufactories combine to extort more wages; and in many instances they succeed for a while at least, or until the old goose dies or is sadly crippled, as we now find her in many an Eastern manufacturing center. Strikes and combinations of various kinds with which all are familiar, may give temporary relief for a time and to few persons, but they tend to unsettle business and make man lose confidence in his race; and so long as these wars between various industries continue, there can be no settled policy in business or healthy progress.

As the giants among the animal and vegetable kingdom fall an easy prey to the myriads of minute parasites which attack them, so must the most wealthy corporation or gigantic enterprise yield to the combined effort of many enemies, no matter how poor and insignificant the individuals of which they are composed. It is conceded that in "union there is strength;" but it should also be borne in mind that it is much easier to tear down than to build up; and it would be well for those who combine to destroy what they may consider a monopoly, to look well to the results, as a wreck often clogs the channels of trade more than a ship under full sail.

FAIRS AS SCHOOLS.

THAT the value of State, County and Town Agricultural Societies, of which there is no end in the United States, is unappreciated by the Rural population, there can be no doubt. When it is considered that one ocular examination of a piece of machinery will give most people a better understanding of it than all the written descriptions which could be made, it is no exaggeration to say that a man may go to one of the periodical Exhibitions or Fairs made by the Societies and learn more in one hour than he could by the hard study of books or newspapers for a week. To this, of course, there may be exceptions; but it is a safe statement in a large majority of cases. In the face of this fact, which will be admitted by nearly every farmer who is asked about it, more people absent themselves from these exhibitions than attend them. It is all wrong. No progressive farmer should allow any of these Fairs to occur within reaching distance without his attendance and that of such of his family as are of sufficient age to observe understandingly the objects surrounding them.

As has before been said, ocular demonstration is worth a hundred written or printed descriptions. Men and women too, are much more susceptible of understanding through these means than any other and will more perfectly retain impressions so made upon their minds. Then too, the scepticism which forms so prominent and valuable a quality of the Nineteenth Century mind, is entirely overcome by this means of teaching. One reads of an article supposed to be an improvement and may or may not believe what is read; but "seeing is believing," as the old adage runs and when the article has been shown to be or to do what is claimed for it, the observer is satisfied.

Again, the sources of information within the ordinary farmer's reach, are limited. There may be many (and doubtless are) things at almost every Fair which will be of value to him in his everyday conduct of the farm, which, though he may not be ready to purchase at once, he can prepare for and eventually obtain with great profit to himself and comfort to his family or his help or both. It might be urged in opposition to the position here taken, that the extra expenses of such attendance are too great, which brings us directly to a point that cannot be too strongly urged. In the Rural districts money is the commodity which is generally scarcer proportionately than anywhere else. This fact induces much short-sightedness and leads people to keep tight hold of every cent which is not absolutely necessary for expenses or which will not show immediate return for the investment. A man who buys land with his money chuckles to himself that it cannot run away; but it is difficult for many to believe that they can spend five dollars in attending a fair and get ideas and knowledge which will be worth fifty dollars to them during the ensuing year. Yet we will venture to say that few farmers have attended their State or County Fair at any time, with ideas other than those of a frolic, that they did not in the course of the following year profit themselves by their observation and information there gained much more than the expense of the attendance.

In conclusion let us say, by all means keep up your Farmers' Clubs and Agricultural Societies. Attend your Fairs and Exhibitions and get the benefit of other experience than your own. You will find many things to complain of in both; but on the whole, you will find the pecuniary balance upon the credit side of your books.

RURAL NOTES.

Twelve Feet Steam Reaper.—The progress of steam machinery upon the farm appears much more rapid in Great Britain than in this country. Among the novelties developed by the Reaper Trial held at Leamington, England, in August, was an implement which may not be immediately of general use in this country, but which must eventually be adopted here, viz.: a reaping machine with steam for motive power. The Mark Lane Express says in its report of the trial:—"The chief novelty of the occasion was Messrs. AVELING & PORTER'S 12-feet reaper, driven from behind by one of their traction engines. This machine was constructed by Messrs. CROSSKILL, of Beverley, on the old Bell principle, with improvements. Working in front or its motive power, it requires no preliminary scythe work, but charges direct into the crop and levels it quickly to the ground, laying it in thick and regular swathes at the rate of from 2½ to three acres per hour. When not at work the reaper is raised six or seven feet from the ground, thus leaving the engine freedom for locomotive purposes and enabling it to be carried over gateways. In a similar manner it is turned at the ends when cutting up and down a field. A water-tank and coal-bunker, each holding a day's supply, form a tender on four wheels, which the engine brings into the field. Only one man besides the engine-driver is required with the machine."

Potato Beetles Wanted.—Prof. C. V. RILEY, State Entomologist of Missouri, paid us a visit recently, and we were not a little surprised to learn that he was desirous of obtaining a peck or a bushel of Colorado Potato beetles. It would seem that in the West, nowadays, the farmer, assisted by the natural enemies of the pests, keep them so effectually in check that it is not an easy matter to get them in such large quantities. Prof. RILEY desires to institute a series of careful experiments as to the properties of the beetle, and for this large quantities are required. They must, however, be killed by dry heat and not by scalding or by poisoning. Will not some of our readers on the sea-shore, where the insects are washed up in large quantities, collect a peck of them and express them to the Professor at St. Louis?

Implements in Europe.—The depression of the manufacturing interests in Germany has had the effect of sending much of that labor into the Rural districts. Thus, in conversation with gentlemen engaged in the Agricultural Implement business abroad, we are informed that the wages of the Rural laborer are now down to less than thirty cents per day, thus bringing hand labor on farms in direct competition with the most economical machine work.

Samples of Cereals.—We are in receipt of a collection of sample packages of cereals from the well-known firm of DAVID LANDRETH & SONS, Philadelphia, Pa. The collection consists of 30 varieties of wheat, 11 of oats, 9 of barley and 2 of rye, one ounce in each, the assortment being offered at the low price of $5, which should be an inducement to farmers who are desirous of obtaining extra fine varieties without paying a high price therefor.

Potato Beetles in Europe.—The Colorado Potato beetle has made its appearance on the other side of the Atlantic, its arrival at Bremen having been announced in several of our foreign exchanges. There need, however, be no fear of the pest spreading in Europe, for they will be stamped out as soon as they appear in any locality, as things are done quite differently abroad than with us, in this country.

RURAL BREVITIES.

ALL who are seeking lands and farms would do well to address the Warren County Land Bureau, at Warrenton, N. C.

SMALL pigs are now cured whole; consequently, a man can purchase smoked ham, shoulders, and sides of bacon all in one package and at the same price.

THE subject of Fertilizers is now attracting much attention. Those who desire to add to their stock of knowledge on this subject can address the Excelsior Fertilizer Works at Salem, Ohio.

CARBOLIC ACID is said to be fully as effectual in destroying the Colorado potato beetle as Paris green; but those who furnish us with the above information omitted to state a very important point in this connection—*i. e.*, which is the cheapest?

THE California papers report the wide-spread prevalence of potato blight or rot in the State. In some localities there will not be half a crop in consequence of this disease. The Colorado Potato beetle as destructive as it has been in the East this season, is preferable to the old-time potato-rot.

IN reading a paper, should your eye rest upon an article credited to "Ex.," or "Exchange," rest assured that the Editor copied it from some paper of which he was too envious or jealous to publish the full name. If editors will steal, why don't they do it "squarely," and not attempt to conceal?

IS not the Gardeners' Monthly in error in stating that Mr. WM. BURGESS was awarded a prize at the late exhibition of the N. Y. Hort. Association for *La Constante* strawberry? An illustration of the prize berry referred to appeared in the RURAL NEW-YORKER, but we can assure the G. M. that it was not the old and long known foreign sort named.

THAT REDTOP COW.

Now farmer Jones he's a thrifty man,
And keeps his fences as well as he can,
And commonly keeps his temper sweet
When his neighbors' cows break into his wheat;
But Redtop's cow, she tried him sore,
Tho' he spoke her softly, she came the more.

Now, she'd vault any fence where she fancied to feed,—
Jones said she was crossed on a kangaroo breed,
At any rate she was a cross to Jones,
And he finally vowed, in no dulcet tones:
"If Redtop don't keep that critter t' hum,
I'll impound her, or pound her, or give her *some!*"

Now Redtop heard of that terrible threat,
But he wasn't worried; says he: "Yow bet
I ain't a-goin' t' hire her kep',
Poor's I am. Boys, don't chase 'or a step;
Jest let her pastur the public feed—
Caow's doin' well—Jones he be deed!"

Now, living under such liberal laws,
That Redtop cow didn't care two straws
For Jones, his fences, or hired men;
She helped herself, ran, and returned again;
But yet, as it chanced, one luckless day,
She was caught, put in stanchions, and foddered with hay.

Now a passing neighbor was hailed with, "Say!
Jest not'fy Redtop, 'f yer going' that way,
As haow his old caow's killed in jumpin' a fence—
(He'll get 'er this time, 'n' I'll bet two cents.")
So the message was sent in a shout from the road,
And it made lively work in the Redtop abode.

"Naow, heavens and airth! killed? I tol' ye, boys, haow
Ye'd orter keep up clusser watch o' that caow!
Jones killed her hisself! Come! fly around! Come!
Hitch the plugs on the stunboat, an' le's snake 'er hum!"
So with hurry and scurry, and cursing, and groans,
They speedily drove to the farm-yard of Jones.

Now there they beheld her,—welt'ring in blood?—
O no! but contentedly chewing her cud.
And Jones, while explaining his message, tries
To smuggle in some good-natured advice,
Which Redtop takes, as he takes her away,
And keeps her at home for a year and a day.

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 189.]

MISSOURI.

In 1818 the residents of that portion of Missouri Territory now included by the State of that name, made application for admission to the Union. This application at once aroused the sectional spirit of North and South—or perhaps more properly, the spirit of the friends of liberty and slavery. It is well known that this antagonism was only quieted by compromise when the Federal Constitution was adopted. The opposition to the extension of slavery was clearly shown in the ordinance of 1787, that arranged for the establishment of the Government of the territory northwest of the Ohio, and there was apparently a fixed determination on the part of the enemies of slavery to say, "Thus far shalt thou go and no farther." When the bill for the admission of Missouri came up before the House of Representatives, it was amended to the effect that the further introduction of slavery into the State should be prohibited and that negro children born in the State after its admission should be free at the age of 21 years. These amendments were rejected by the Senate and the bill for admission failed. Thereupon arose a contest that extended throughout the whole country and threatened, for awhile, to sever the Union if not overturn the whole Government. The press was bitter in its antagonism and the best words of orators, North and South, were used to prove the right of their positions. The antagonists were not only influenced by the great moral principles at issue, but were embittered by sectional jealousy, personal interest, party zeal and all the minor elements that are usually drawn or forced into such contests, and which have the effect to impart a degree of acrimony that the cool, calm and fair discussion of the real questions at issue would never produce.

By the advocates of slavery extension it was held that the French Province of Louisiana had, from its settlement, sustained and encouraged negro slavery, and it was supposed its existence as a province and success as an agricultural country depended upon its continuance; that the deed of cession was made conditioned that all citizens should be protected in their liberty, religion and property. Hence, it was claimed, Congress had no right to interfere with the question of the perpetuation of slavery in the territory purchased, nor to make its abolition a condition of the admission of any particular part thereof to the Federal Union as a State.

The people of the North looked upon the extension and perpetuation of slavery as prejudical to the best interests of the whole country. They claimed the Compromise made when the Constitution was adopted was only for conditions that then existed, and while they admitted the validity of the position taken by the pro-slavery party so far as related to the then existing status of slavery in the Louisiana purchase, they held that no State could be admitted to the Union except with a Constitution of which Congress should approve, and consequently, unless the applicants were willing to agree to the non-perpetuation of slavery, they might legally and properly be denied the privilege of State Government.

In the fall of 1819 application was again made. The Senate favored admission and the House opposed it. The friends of the measure in the Senate attempted to carry their point by incorporating the claims of Maine (then also an applicant for admission) in the same bill. To this the House would not consent. At length, after a long and bitter contest, a compromise was agreed upon to the effect that Missouri might be admitted with slavery as desired, but that slavery should not be established in any States thereafter formed lying north of 36° 30′.

But the end was not yet. In wrath at the treatment she had received, Missouri incorporated in her Constitution a clause preventing free negroes or mulattoes from settling or coming into the State. This was considered an insult to Congress and beside the Constitution had provided that the citizens of one State should have the rights and privileges of the citizens of any other State in which they might be, and as free negroes were obviously citizens, the law, if made, would be unconstitutional and set aside by the Supreme Court. But Congress considered the act offensive and refused to approve that clause, and again the question was debated with all the bitterness of sectional animosity. A resolution was then offered, conditioned that the State be admitted, with an agreement and promise never to pass any law preventing any description of person settling therein who were then or might thereafter become citizens of any other State, and that the Legislature should publicly give assent to such fundament condition. The resolution was lost.

Within a few days thereafter the electoral votes for President were to be counted and the question arose if Missouri was a State and if her offered votes were to be taken, although it was well known it would make no difference in the result. When the joint meeting of the Senate and House took place for the purpose of counting the votes and proclaiming the result, much turbulent disorder occurred. Finally, a member formally objected to receiving the votes, on the ground that Missouri was not a State. Amid the tumult that followed and as the only practical means of restoring order, a Senator moved that the Senate withdraw, which was immediately carried and the House was left in sole possession of the hall. For an hour little could be heard but "Missouri is *not* a State!" "Missouri *is* a State!" and the ineffectual efforts of the Speaker to restore order. At length Mr. CLAY succeeded in being heard with a motion that the Senate be recalled. After a few pacific remarks from him quiet was restored, the Senate appeared, the votes were counted, and it was declared that with or without those of Missouri, JAMES MONROE was elected President. RANDOLPH, of Virginia, then offered a resolution in effect that whereas it had not been declared *how many* votes had been given for President and Vice-President, as required by the Constitution, the proceeding was irregular and illegal.

It was evident to most that there was at least a doubt as to the validity of allowing a State not in full fellowship to vote, even if the vote made no difference in the result. But to pass Mr. RANDOLPH'S resolution would be to reopen the whole question, of which the entire country both in and out of Congress were heartily sick. The resolution was rejected by a majority of 30. Expediency was allowed to overpower doubt—as in the more recent case, when the Supreme Court of the United States reconsidered the Legal Tender Act and decided that debts incurred before the passage of that act might be paid in greenbacks. In both cases the fear of insurmountable difficulties resulting from any other action, was probably the incentive which gave votes enough to make the majority in both cases.

But whether Missouri was or was not a State, still remained an open question. It was well understood that the people would not submit peacefully to United States' jurisdiction as a Territory, and they were too far away to have it easily enforced. The opponents of admission were in a condition to accept any feasible road out of the difficulty, and again Mr. CLAY exerted himself as a pacificator and finally succeeded in securing the appointment of a committee named by himself, who reported a resolution very similar to the one rejected two weeks before, but more specific. Congress was now ready to pass the resolution and the conditions prescribed having been complied with, Missouri, by proclamation of the President, on the 10th day of August, 1821, became one of the States of the Federal Union, with boundaries as follows:—The Mississippi River on the east, commencing at latitude 36° and running north to the mouth of the Des Moines, following the latter river to latitude 40° 50′; thence west to the Missouri River and down that river to the mouth of the Kansas; thence south to latitude 36° 30′; thence east to the St. Francis River; thence down that river to latitude 36°; thence east to place of beginning.

ARKANSAS.

When Missouri made application for admission as a State, that portion of the Louisiana purchase lying between Missouri and Louisiana and still called Missouri Territory, made application for change of name and of government. Consequently, in 1819 it was made a territory of the second grade and named Arkansas.

In 1836 it was found that the population of the eastern part of the territory was sufficient to entitle them to a State Government. The question of slavery had been settled on the admission of Missouri. A Constitution was formed, and as the application met with no opposition Arkansas, in June, 1836, became the twenty-fifth State of the Union. Its territory is included between Louisiana on the South, the Mississippi River on the east, Missouri on the north, and running from the southwest corner of Missouri to the Arkansas River in latitude 35° 23′; thence south to Red River and along the same to longitude 93° 58′; thence south to latitude 33°, the northern line of Louisiana, and contains 52,198 square miles.—[To be continued.

The Story-Teller.

THE OPPOSITE NEIGHBOR.

BY VIOLET FULLER.

"THERE he is again, I declare," said ESTHER CARLYLE, the little hard-worked music teacher, as she pulled up the window blind of her third story back room one morning in December. "He is as regular as clock-work; I wish I could see exactly what he looks like;" and she tried to strain her rather near-sighted gray eyes across the intervening space of back yards which separated her from the object of her curiosity; but in vain—the distance was too great and, besides, the individual in question had retreated from view. It was strange how she and this unknown personage kept the same hours, both in rising and retiring; at least it seemed so to ESTHER, as many a night she had watched the light from that particular window, after her own was extinguished, for she could not afford to keep it lit very long and thought with what a friendly, cheering ray it shone out into the darkness.

ESTHER CARLYLE was an orphan, and entirely alone. In the boarding house in which she lived she was looked upon as a quiet, little soul, who minded her own affairs and who had nothing in common with the gay young ladies and gentlemen who inhabited the same house. She might, had she so willed it, have lived with some rich relatives in a fashionable locality, but merely in the position of a poor relation; and she preferred to work by herself for the modest pittance which enabled her to pay her board in a respectable house and dress plainly, it is true, but sufficiently well to satisfy herself. She also tried that most precarious of methods of earning money—writing stories for the weekly papers, with but indifferent success.

How often had that sickening feeling of disappointment come over her which attacks the unfortunate recipient of "returned manuscript," just when one is beginning to hope it has been accepted. She had music pupils however, who paid punctually, and although the life was hard and lonely for a girl not yet twenty-five, yet she had the "glorious privilege of being independent." Her room was neat and comfortable, although small and, confined as to outlook, her only glimpse of sky being over the roofs of the houses.

ESTHER was feeling unusually lonely and friendless this morning as she put on her neat out-of-door costume and prepared for her day's work. She had six lessons to give before four in the evening and the pupils lived at great distances from each other. "I wonder what my opposite neighbor does," she thought; "writes, most probably, as he sits up so late; well, I hope he is more successful than I am. I have a great mind to try the regular 'blood and thunder' style; that *might* go down with the million. But I must hurry;" and she gave a final look in the glass as she gave her little black hat the proper set over her luxuriant dark-brown hair and taking up her roll of music, left the room, locking the door carefully behind her. ESTHER was not a beauty, but she was a very pleasant object as she went swiftly along the street, the crisp morning air giving a becoming tinge of pink to her delicate cheeks. Her face was a perfect oval, generally devoid of color, save for the rich red of the small, sweet mouth. Her eyes were dark-gray, full of expression, and set under a broad, low forehead from which the brown hair was brushed back in natural waves; all this, with a small, beautifully-rounded figure and quick, light step, made the girl an object of many admiring glances from gentlemen on their way to business, who had leisure and taste to admire her refined and lady-like appearance.

Nor was she quite unconscious of such glances for, like every woman, be she young or middle-aged, she had her little vanity. She got through her day's work with the usual amount of stupidity on the part of some of her pupils and the wear and tear of nerves, which is the portion of music teachers, and felt very jaded and worn out as she took her seat in the car which would carry her almost to her boarding-house. The car was filled with gentlemen returning to dinner after the labors of the day, but ESTHER got a seat from a polite, middle-aged individual, who gave a start as he saw her face and looked at her as often as he dared without attracting attention. She thanked him as she took the seat he offered, but took no more notice of him, as her thoughts were occupied with a story she intended to begin soon, in order to compete for a prize which had been offered by a weekly paper. It was a forlorn hope, but still she *might* be fortunate, for once in her life.

The car stopped and ESTHER, recollecting herself, found she had arrived at the end of her journey and rose to go out, the gentleman who had given her the seat preceding her and waiting to hand her down. He held out his hand to assist her and she unconsciously placed hers in it, without thinking of the unusual nature of the proceeding on the part of a stranger when, to her surprise, her hand was retained in a close clasp and a deep voice said, "I was sure it was you, ESTHER—Miss CARLYLE." It was not quite dark and ESTHER could distinguish the features of the stranger, which were not as familiar as the voice, that never changes, and years ago in her radiant girlhood, when she lived in a happy home with her parents, that voice had asked in pleading accents for more than she could give; for was she not engaged to one of the handsomest of the "golden youths" of the metropolis? who "loved and rode away," on discovering that Mr. CARLYLE was on the eve of failure.

"O, Mr. MAXWELL," said the girl, looking up into the kindly brown eyes, which surveyed her with undisguised pleasure, "is it really you? why, I thought you were living out West."

"I was," answered the gentleman, "but I have come East for good; let me see you home and we can exchange notes on the way."

"I live very near this," she answered. So they walked away together.

"You have not changed much, Miss CARLYLE; or am I right in calling you thus?" began Mr. MAXWELL.

"I am still ESTHER CARLYLE," was the quiet answer. "Indeed," and here the girl laughed rather bitterly, "I have had no temptation to change my name since I have become poor and alone in the world."

"Alone!" exclaimed Mr. MAXWELL, "why, how is that? I knew your father was dead, of course; but I did not hear of your mother's death; that must have taken place after I left the city. But surely, you have relatives?"

"I have, who would give me a home if I chose to be a slave to their whims. But I prefer independence and my three-story back room, small as it is, and I am not afraid of work."

"You are a brave little soul, ESTHER—you will excuse my calling you so, in memory of old times," said Mr. MAXWELL, as they stood on the steps of the boarding house.

"I will excuse anything," replied she, warmly; "I am so glad to see a friend who knew me in those bygone days; but won't you come in? Although I have no place to receive you except the public parlor."

"Not to-night, but I will call very soon. I live quite close to you—did you know . . ? Just around the corner."

"Ah, that is delightful to have a friend so near. Good night;" and [illegible] gave him her hand, which he pressed [illegible].

"Think of [illegible]nd, ESTHER," replied Mr. MAXWELL, "good night!" he released her hand and [illegible] slender, graceful figure as she entered the house, in the light of the hall lamp. "ESTHER CARLYLE," he murmured, as he took his way to his boarding-house in the adjoining street, "time was when that name had power to thrill my heart and when the very sight of her was happiness enough, even if she did not speak to me. She is not much changed either, in spite of her troubles. I know she must have suffered at being cast off by that scoundrel for whom she refused me. What a brave little soul it is! facing the world at her age—for she can't be more than twenty-five—and after the luxurious manner in which her girlhood was passed—by the way, I never asked what she did to earn money. Teaches, I suppose. Poor ESTHER! Well, I will find out all about her, and if—but *that* is hoping too much;" and with a sigh Mr. GEORGE MAXWELL opened the door of the boarding-house with a latch-key and went up to his comfortable bachelor's—or rather widower's—apartments, where a bright fire burned in a low grate in the pretty sitting-room which, with its luxurious arm-chairs and rich carpet, formed a striking contrast to the poorly-furnished little room in which ESTHER was at this moment taking off her hat and jacket and smoothing the rich waves of her pretty dark-brown hair, preparatory to descending to partake of the late dinner, which was served below.

ESTHER was astonished at the radiant face she saw in the glass, so different from the one she had parted from in the morning. The cheeks were rosy and dimpling with smiles, while the soft gray eyes, under their finely-arched brows, shone with a bright and joyous light to which they had long been a stranger. "To think of meeting GEORGE MAXWELL, of all people in the world!" she said, as she arranged her neat, black dress and put on a clean, crisp ruffle round her white, slender throat. "Dear old GEORGE! I am glad he does not think me changed. He seems to have grown stouter and he is certainly graver in manner and expression. He always had a good, kind face, and his eyes are quite handsome. But where is his wife? he did not mention her at all. Perhaps she may like me, and it will be pleasant to have friends of that kind." And thus musing, she went down to dinner, looking so bright and pretty that the young men of the house were struck with her unusual beauty. Altogether, she was so excited about the meeting with Mr. MAXWELL, that she forgot her opposite neighbor until she went at the window to look at the small piece of sky visible above the houselops and saw his light streaming out into the night like a friendly beacon.

GEORGE MAXWELL found himself on the next evening on the door of ESTHER'S home, almost without his own volition. He had been thinking of her so constantly all day, that insensibly his feet carried him in the direction of her presence.

She came down to the parlor to see him, looking very happy and prettier, he thought, than she had been in her girlish days. Of course she had lost the first freshness and bloom of her extreme youth, but her delicate face had gained in beauty and sweetness of expression. Altogether, GEORGE thought she was better worth winning now than in her younger, more prosperous days; and as they had the parlor to themselves this evening, he was able to gain a better knowledge of her intellectual progress, as well as of her sweet, we-

manly nature, than in the days when he asked her to be his wife.

They had much to talk about and GEORGE told to his sympathetic listener the story of his wife's death in their Western home, and how he had come, feeling desolate and lonely, (having never had a child,) to his old home in the city of B——, and had taken rooms in a comfortable house, where he intended to remain. He was rich, he said, having made money in the West.

ESTHER had very little to tell of her uneventful life; she tried to be contented, she told him, but it was rather lonely.

"Well, you will not be lonely now that I am so close at hand," said Mr. MAXWELL, as he rose to go. "And you must promise to let me know when you want assistance in any way——"

ESTHER smiled up at the stalwart figure and kind grave face and promised; so, with an affectionate good night, he left her, determined, in spite of her former rejection, to woo her again to be his wife.

In pursuance of this intention, he saw her almost daily, sometimes going with her to the doors of her pupils' houses. He gave her books, music and so many hot-house flowers, that her little room became a bower of beauty and fragrance. All these attentions she accepted; indeed, she could hardly refuse them. He was only GEORGE MAXWELL, her old friend, and quite middle-aged—nearly forty, in fact.

But at the end of a month she found that these attentions meant something, when GEORGE again asked her to marry him—and again she refused! It was only pity for her forlorn condition, she told herself; he really did not care for her in that way, now that she had grown pale and faded, and she told him the same, very gently and tenderly, and he, without a word, turned away, wounded to the quick at her second rejection.

He wrote her a note afterward, bidding her good-by; he was going away for a time, but wished her to write if she ever required assistance, to an address which he gave her in a Western city.

So he was gone; and ESTHER wept bitterly at the thought that she had sent him out into the world again just as he was beginning to feel happy; and yet, what could she do? She felt as though he was merely making a sacrifice of himself for her sake. She could not marry him with that feeling, and then she doubted whether she loved him enough. Somehow, she expected a different sensation toward the man she married, and certainly the feeling she had experienced for the lover who had deserted her, was of a widely different character.

She was doubly lonely now that GEORGE was gone; she missed all the kind looks and tones, the thousand little attentions she was wont to receive from him—why had he not been satisfied with friendship? But it was all over, and he was gone. So she set herself to work at the story she intended to write for a prize, in order to forget the pleasant hours she had passed with her friend. But in vain! he would not be banished; his kind, brown eyes were ever before her, and she longed for the sound of his deep, musical voice, and the warm clasp of his hand.

To make matters worse, her opposite neighbor had ceased to keep time with her movements; his blind remained down altogether, and at night no friendly ray of light, shone forth through the darkness to cheer her loneliness.

Poor ESTHER! she toiled on at her story, writing until far into the night; every night, no matter how weary she was, until at the end of a month it was finished.

It was about one o'clock in the morning when she penned the last words, and was just gathering up her writing materials when the cry of "Fire!" rang through the house. "Fire!" she heard immediately afterwards in the street, and then the bells began to clang out in the frosty midnight air.

ESTHER was brave, but she was afraid of fire. She rushed to the door and looked out; the staircase and passage were full of smoke, which rushed into her eyes and caused her to retreat to her room. Not a soul was to be seen, and she could hear nothing save the crackling of flames, which crept nearer and nearer, licking the staircase as they came like fiery serpents. She called, but no one answered. Had they forgotten her? Every woman in the house had a friend to rescue her; but she was alone! "God help me!" she cried; "if GEORGE were only here!"

The smoke and flame drove her still further into the room and she felt that her doom was sealed. She must die there, alone! suffocated by that terrible smoke. She hoped her sufferings would not be long; she never thought of saving anything, for where should she take them?

She sat down on the floor in a stupor and covered her face with her hands; then jumping up suddenly, she gave one last, despairing cry: "GEORGE, GEORGE! if you were only here!"

"ESTHER?" called a stifled voice on the stairs. "Where are you?"

She rushed forward, blinded by smoke and flame, and was snatched up in GEORGE MAXWELL'S strong arms and borne down the burning staircase. "Thank GOD! you are safe!" he said, as he stood in the cold street with her form still held tightly in his grasp.

"And thank GOD that you came!" she said, as she clung to his neck amid the shouting, struggling crowd. She trembled with cold and fright although, fortunately, she had all her clothing on, still the night air of March was chill and searching. "You must come to my boarding-house," said Mr. MAXWELL, as he made his way through the excited crowd, and still carrying her he walked as swiftly as he could round the corner and into the next street, where he entered the house, made his way upstairs and deposited his precious burden on the sofa in his warm sitting room, where a fire was burning and the gas lit, late, or rather early, as it was. "There, ESTHER," he said, stroking the brown hair back from the pale little face, "rest yourself and stay your weary feet on a friend's threshold."

He spoke so kindly and the girl was so glad to see him and so thankful for her escape from death, that she burst into tears.

"ESTHER, darling, what is it?" he said. "You are tired and your nerves have received too great a shock. I will give you something to revive you and then you must take possession of my room and try to sleep."

He got her some wine and a biscuit, waiting on her with a grave, fatherly tenderness. She drank the wine and felt better, but refused to take his room.

"I don't intend to occupy it to-night," he said; "I am going round to C—— street, to find out the extent of the damage; you did not save anything, of course?"

"No, I had not time; and there is really nothing—O, my manuscript!" she exclaimed, recollecting it; "my prize story!"

"I'll find it for you if you promise to go to bed, ESTHER. I will leave you now, and hope when I come back, to find you have obeyed me, so good-night, my rescued darling!" and he kissed passionately the little hand, a liberty which ESTHER did not resent. "Good-night," she said, "my preserver!"

He kissed her hand again, his grave face all aglow, and left the room; while ESTHER, taking a traveling rug from a chair, timidly opened the bedroom door and laid herself down on the bed in the dark, where she soon fell into a sound sleep.

When she woke the sun was shining and she jumped up hastily, surprised to find herself in a strange room; but the past night came back to her as she went to the window and looking out, saw straight before her what she knew must be her own room, with the window blackened with smoke, but otherwise unharmed. Yes, that was the house, and the yard seemed to be filled with a mass of rubbish, crockery and furniture, which had no doubt been thrown from the burning windows. Then looking at the position of the house from where she stood, it suddenly occurred to her that this was the window of her opposite neighbor and——GEORGE MAXWELL must be the man himself!

As she thought this, a knock at the door startled her. It was the landlady, wishing to know how she was, informing her, also, that the fire had not been so bad as was thought, and that Mr. MAXWELL was waiting for her in the sitting-room. He had slept upstairs.

ESTHER made a hurried toilet, reflecting that she had neither bonnet or cloak to go out in, and went into the sitting-room, where GEORGE came forward to meet her, his brown eyes full of love and tenderness. She held out both hands, and he took her to his heart without a word. No need to ask a question—he knew she was his at last!

"Little darling!" he murmured; "ESTHER, how could you be so cruel as to send me away? and I came back just in the nick of time to save you. How gladly you rushed into my arms, through smoke and flame."

She laughed softly as he kissed her. "GEORGE, it was your going away that made me love you; and—did you find my manuscript?"

"Alas, no; it is a great misfortune, no doubt, but it is gone!"

"Well, I can do without it, now, as long as I have become acquainted with my Opposite Neighbor."

DEATH OF ORATORY IN THE ENGLISH HOUSE OF LORDS.

THERE is not one orator in the old sense left in the House of Lords—not one man who possesses in full measure the art which Mr. Gladstone and Mr. Bright usually and one or two more men occasionally—Mr. Sullivan, for example, when he is really excited, or Mr. Lowe, when he loses his intellectual temper—still employ. There is not only no one like Lord Brougham, Lord Lyndhurst or Earl Grey, but there is no one like Lord Derby or Bishop Wilberforce. Lord Salisbury is an orator and probably would seem one if he sat in the Commons, or could be mentally thrashed every night for a session in the presence of a great audience; but his powers require provocation, which they do not often receive, everybody being more or less afraid of him; and there is no one else. Lord Cairns has the forensic readiness of his profession, but no passion; the Duke of Argyll speaks logically, but with the effect only of a clear-minded professor, to whom the "divine gift" has been conceded, but not the "divine afflatus;" Lord Derby is marvellously sensible and sometimes very terse, but never carried away a human being; Lord Coleridge's silver tongue is too seldom heard in the House; Lord Granville only talks well and easily, putting a trace of cayenne in his talk; and Lord Carnarvon is bound by his office to make complicated questions clear, and only glows into orator when the chivalric side of his nature is roused or wounded. Lord Grey retains something of the style of the passed-away orators and can, in a happy mood, be persuasive, but his speaking wants rush and heat; and the Duke of Somerset, telling as his speeches are, is an epigrammatist, not an orator. Most of the young men talk like clever young men and no more, and Lord Rosebery is the only one among them who says anything people care to read for its own sake. The debating, in fact, though sometimes effective, and once or twice in a session exciting from the visible heat of the disputants, grows dull and threatens to be, before long, as dull as the debating in the Commons when the leaders are not present.—*Spectator.*

ABESTOS.

A CURIOUS exhibition has just been organized at the Simonetti Palace, on the Corso, in Rome. It is a display of abestos in all the stages through which it passes from the time that it is taken out of the bowels of the earth until it appears as a manufactured article. The ancients had a means of weaving it and with it made napkins for meals, wicks for lamps and winding sheets for the dead for the purposes of cremation, so that the ashes of the deceased could be collected unmixed with those of the wood which had formed the funeral pyre. The process of working this textile has been again discovered by the Marquis de Batrera.

THE latest thing in advertising can be seen on the banks of the Clyde, in Scotland. The proprietors of the Glasgow News rented some land which lies sloping to the Firth of Clyde, and in the turf they cut the name of the paper.

THERE is a great deal of love in this world which the objects on whom it is wasted would be better without—love that is so kind as to be cruel.

The Literary World.

RECENT LITERATURE.

The Father's Story of Charley Ross. By CHRISTIAN K. ROSS. Philadelphia: John E. Potter & Co.

JUDGING by the title above, one would naturally suppose this book to be one of those sensational stories which are generally the followers of each romantic event exciting public interest. Indeed, such a judgment would not be incorrect as to the word sensational. It is more than that. It is exciting in its pathos. Filled with dates and names of places—two things generally detested by seekers of exciting books—the incidents are set forth in a simple manner, exactly as a man would tell his own story of his great bereavement to his immediate friends who might be interested in his welfare. We opened the book with a sigh for the loss of time required to read it and hardly closed it until we had finished, with a feeling of wonder at the strangeness of the incidents and pleasure at being possessed of all the facts of a case which has engrossed so much attention during the last two years. Even if we did not know that the father of the abducted child was the author, the simplicity of the tale itself would be guaranty of its veracity. Supposing heretofore, that we were familiar with the CHARLEY ROSS case, we now discover that we actually knew little about it before this book was published. The author closes his work with an expression of that hope for the eventual unraveling the mystery which has sustained him throughout his long, unsuccessful search for his lost boy. His object in publishing the book is twofold:—1. To assist, if possible, in unveiling the mystery of his boy's whereabouts; 2. To obtain means to enable him "to continue the search that cannot be abandoned until the child is found or his death is certainly proven." Both objects are equally commendable.

BOOKS RECEIVED.

FROM T. B. PETERSON & BROTHERS, Phila., Pa.:
Countess of Rudolstadt—A Sequel by Consuelo, by George Sand. (Paper—pp. 183. Price, 75c.)

SCRIBNER, ARMSTRONG & Co., New York:

ALONE.

BY RUNE BLUFF.

Oh, beats there a heart that never has known
One dear loved spot it could call its own?
Can one look back, one with hair now gray,
Without a sigh for life's vanished May?
One, whose baby lips were by love unpressed?
Whose childhood's hours were by love unblessed?
If so, what a wilderness 'twas, poor heart!
What a grim, drear life for a baby's part!

There may be some, thank God they are few,
Who of youthful sweets so little knew;
Who stood or fell when the tempter came,
No voice to praise, but many to blame;
With none to guard from danger and sin,
Who fought alone, to lose or win;
Whose griefs or joys there were none to share,
Who came or went with none to care:

Who had no debt 'twould be sweet to owe
For the kindly helps Love can bestow;
Who in their prayers, if they learned the way,
Had never a dear, loved name to say:
In whose dreams came never a sweet, home face,
That Time from the heart could not efface;
No grass-grown graves where they went to weep,
No tender mem'ries fore'er to keep:

Who lacked that love our hearts all need,
Till their virtues sowed at length the seed
In other hearts, where it grew and bore
Love's pleasant fruit, all unknown before;
Or if to their aid no kind word came,
Till good and ill were to them the same;
Who died as they lived, unloved—who slept
In graves where Love no vigil kept.

I WILL GIVE NOTHING.

"THERE is that scattereth and yet increaseth; and there is that withholdeth more than is meet, but it tendeth to poverty."—*Proverbs* 11: 24.

A MINISTER soliciting aid towards his chapel waited upon an individual distinguished for wealth and benevolence. Approving the case, he presented to this minister a handsome donation, and turning to his three sons, who had witnessed the transaction, he advised them to imitate his example. "My dear boys," said he, "you have heard the case; now what will you give?" One said, "I will give all that my pocket will furnish;" another observed, "I will give half that I have in my purse;" the third sternly remarked, "I will give nothing."

Some years after, the minister had occasion to visit the same place, and recollecting the family he had called upon, he inquired into the actual position of the parties. He was informed that the generous father was dead; the youth who had cheerfully given all his store was living in affluence; the son who had divided his pocket money was in comfortable circumstances; but the third, who had indignantly refused to assist, and haughtily declared he would give "nothing," was so reduced as to be supported by the two brothers.

The incident furnishes a most suggestive comment upon the text which stands at the head of it. And there are plenty of parallel texts and facts.

WHAT IS REPENTANCE?

Is it a certain state of feeling into which we are to work ourselves before we believe? Surely not. It just means, as is now generally admitted, a turning round towards God. When Christ began to preach, he summed up the whole of his teaching in these two words, "Repent ye, and believe the gospel."—Mark 1: 15. So the Apostle Paul, when he reminds the Ephesian elders of his labors among them, says, "I have taught you publicly * * * repentance toward God and faith toward our Lord Jesus Christ." (Acts 20. 20, 21. In other words, "Turn round toward God and take the gift of his love. The two things must go together.—*Pastor Theodore Monod.*

LAY PREACHING.

THE feeling in favor of lay preaching is gaining strength; probably Mr. Moody's popularity has given it considerable stimulus. The Presbyterians talk of establishing a lay college and several religious journals strongly favor the movement; among them is Zion's Herald, which makes the excellent point that this movement is but an attempt to restore the primitive form of evangelism. Certainly Christ did not send out an educated ministry; it is equally certain that the "live" members of churches in which Sunday schools are large and prayer meetings are well attended, pray as well and talk as nearly to the point as the average minister does.

THOUGHTS FOR THINKERS.

BUNYAN with irresistible zeal preached throughout the country, especially in Bedfordshire and its neighborhood, until on the restoration of Charles II., he was thrown into prison, where he remained twelve years. During his confinement he preached to all to whom he could gain access, and when liberty was offered to him the condition of promising to abstain from preaching, he constantly replied, "If you let me out to-day, I shall preach to-morrow."

ALL our sufferings are ordered by a Father; 'tis the portion our Father gives us to drink, and whatever bitter ingredient there is in it, still it is of a Father's procuring, and why suspect it to be poison and be afraid of it?

Ladies' Portfolio.

THE FAIR HUMBUG.

Of mellow voice and soft address,
She is so meek at first you'd guess
That she could only answer, "Yes,"
The Humbug!

Speak you too plain? she'll only try
To hide her blushes from your eye,
And breathe the while perhaps a sigh,
The Humbug!

And should you make your last demand,
She'll only gently press your hand—
Perhaps she does not understand—
The Humbug!

Urge not your suit, nor love bestow,
Unless you really want to know
How firmly she can answer, "No,"
The Humbug!

[*Home Journal.*

WOMAN.

Particularly to the wives and mothers of the present I would address these words of kindly warning and suggestion. Here, entering upon the second century of our existence as a nation, and claiming all the refinement and intelligence of the most advanced civilization, we still, as a people, overlook the great desideratum—the training of our daughters to the plain, simple, every-day duties of life. This is a thing which forces itself upon the attention of the great mass of our people at this time, from the fact that our merchants and those engaged in trade, commerce and the mechanic arts, after a long and successful career, find themselves beset on every side by the difficulties of a depreciated currency. Business of every class is prostrated, and thousands are suffering for want of employment who have hitherto enjoyed all the comforts of life, and many comparative affluence.

Retrenchment is, then, the order of the day, and among the first is the reduction of the number of domestics in many households where two, three, and even five to one have been supported; and for the first time the wife finds herself thrown on her own resources, and compelled to work her way unassisted into the mysteries of housekeeping.

What tears are shed and heart scalds over heavy bread, sodden meats, vegetables wretchedly cooked and unfit for food. To sweep, dust and arrange the furniture; dress the table suitably; to cook and place upon it the nicely-prepared meal, is of equal importance with neatness and cleanliness in her person—nice arrangement of the attire; and infinitely more so than a smattering of the languages and a sufficient knowledge of music to dash off in an imperfect manner some of the airs of the day.

To you—wives and mothers—we must look for an improvement in this respect; and while we would encourage and assist in all efforts tending toward a higher education of our women, we would *insist* on their training in all those duties so necessary to the well-being, comfort and happiness of every well-ordered household.

We see our young ladies, as soon as they have received a good, common-school education (and it is their own fault if they have not availed themselves of the opportunity afforded them), sent to a fashionable school to finish,—or in other words to learn to practice many of those manners and arts which tend to banish that native modesty and attractiveness which is so beautiful in woman. From this scene she is immediately introduced into society. One continual round of excitement begins, and between a study of the toilet, shopping, paying visits and entertaining in return, her time is fully occupied, to the neglect of the nobler and more intelligent pursuits which should prepare her for the real duties of life. The preparation and cooking of a dinner, the making, washing and ironing of a shirt, are things not to be thought of, and she finally, after a season of flirtation and courtship, marries the man who, as she thinks, is stylish, and can afford an elegant maintenance. He, on the other hand, has commenced his business career, after receiving a common-school education, at the very bottom of the ladder, and after performing all the duties of his station (whatever they may be) acceptably to his employer, gradually rises higher and higher, until he attains to the highest position in the house, where a larger field of operations is opened to him, requiring energy, perseverance, judgment, and a constant and unceasing vigilance.

To him work is his constant companion, and it must necessarily be to provide for the wants of every-day life. His is a life of action. Has her education fitted her to be the helpmeet of this man? Rather has it fitted her to be a constant clog to his exertion, and in place of according him a hearty and cheerful assistance in all his plans—making their home bright and happy in its every comfort, her loving heart, watchful eye, ready hand, smoothing and making pleasant the rugged pathway of life, and contributing, by her care, industry and economy to render his footing surer and safer on the ladder of fortune—his economy and close attention to business is looked upon as a parsimonious devotion, which is wholly unnecessary.

Let us then instruct our young ladies in all that is useful, and in contributing to the comfort and happiness of others they will find the highest attainable reward.

FLOWERS IN THE HOUSE.

Why not have some elegance in even the humblest home? We must, of course, have cleanliness, which is the special elegance of the poor. But why not have pleasant and delightful things to look upon? There is no reason why the humbler classes should not surround themselves with the evidences of beauty and comfort in all their shapes, and thus do homage alike to the gifts of God and the labors of man. The taste for the beautiful is one of the best and most useful endowments. It is one of the handmaids of civilization. Beauty and elegance do not necessarily belong to the homes of the rich. They are, or ought to be, all-pervading. Beauty in all things,—in nature, in art, in science, in literature, in social and domestic life.

How beautiful and yet how cheap are flowers. Not exotics, but what are called common flowers. A rose, for instance, is among the most beautiful of the smiles of nature. The "laughing flowers," exclaims the poet! But there is more than gaiety in blooming flowers, though it takes a wise man to see the beauty, the love, and the adaptation, of which they are full.

What should we think of one who had invented flowers; supposing that, before him, flowers were unknown? Would he not be regarded as the opener-up of a paradise of new delight? should we not hail the inventor as a genius, as a god? And yet these lovely offsprings of the earth have been speaking to man from the first dawn of his existence until now, telling him of the goodness and wisdom of the Creative Power, which bade the earth bring forth, not only that which was useful as food, but also flowers, the bright consummate flowers, to clothe it in beauty and joy!

Bring one of the commonest field flowers into a room, place it on a table or chimney-piece, and you seem to have brought a ray of sunshine into the place. There is a cheerfulness about flowers! What a delight are they to the drooping invalid! They are like a sweet draught of enjoyment, coming as messengers from the country, and seeming to say, "Come and see the place where we grow, and let your heart be glad in our presence."

What can be more innocent than flowers! They are like children undimmed by sin. They are emblems of purity and truth, a source of fresh delight to the pure and innocent. The heart that does not love flowers, or the voice of a playful child, cannot be genial. It was a beautiful conceit that invented a language of flowers, by which lovers were enabled to express the feelings that they dared not openly speak. But flowers have a voice for all—old and young, rich and poor. "To me," says Wordsworth,

"The meanest flower that blows can give
Thoughts that do often lie too deep for tears."

Have a flower in the room, by all means. It will cost only a penny, if your ambition is moderate; and the gratification it gives will be beyond price. If you can have a flower for your window, so much the better. What can be more delicious than the sun's light streaming through flowers—through the midst of crimson Fuchsias or scarlet Geraniums! To look out into the light through flowers—is not that poetry? And to break the force of the sunbeams by the tender resistance of green leaves! If you can train a Nasturtium round the window, or some sweet peas, then you will have the most beautiful frame you can invent for the picture without, whether it be the busy crowd, or a distant landscape, or trees with their lights and shades, or the changes of the passing clouds. Any one may thus look through flowers for the price of an old song. And what pure taste and refinement does it not indicate on the part of the cultivator!

A flower in the window sweetens the air, makes the room look graceful, gives the sun's light a new charm, rejoices the eye, and links nature with beauty. The flower is a companion that will never say a cross thing to any one, and will always look beautiful and smiling. Do not despise it because it is cheap, and because everybody may have the luxury as well as yourself. Common things are cheap, but common things are invariably the most valuable. Could we only have fresh air or sunshine by purchase, what luxuries they would be considered; but they are free to all, and we think little of their blessings.—"*Thrift*," *by Samuel Smiles.*

About Fans.—The cheap grotesquely figured fans now in use here are made in Japanese homes, all the members of families working on them. The pictures are drawn on thin paper, pasted on a slab of wood, and then engraved, a separate block being used for printing each color. Children do the splitting of the bamboo and the pasting of the paper. In Japan that kind of fan is used by women, and the men carry the handsome folding article. It is customary there to exchange fans, as we do photographs, and to inscribe them with autographs and sentiments.

FOR AND ABOUT WOMEN.

A young lady, on being asked what business her lover was in, and not liking to say he bottled soda answered: "He's a practicing fizzician."

Young damsels, like house plants, should be kept in doors these moonlight nights. Frost and love do not go well together. The former brings on consumption and the latter matrimony.

Let it be recorded for the comfort of disconsolate virgins wherever they do languish. A maiden lady was married in Haverhill, Mass., last week, after turning her 45th birthday. The bridegroom was her junior by two years.

The ladies are beginning to wear the famous coaching hat which during the season cast all other head-gear in the shade at the fashionable resorts. The brims are very wide and the hat is worn far back on the head and tipped over sideways, imparting to the occupant a decidedly coquettish and jaunty appearance.

Reading for the Young.

THE STUBBORN BOOT.

"Bother!" was all John Clatterby said;
His breath came quick; and his cheeks were red;
He flourished his elbows, and looked absurd,
While, over and over, his "bother!" I heard.

Harder and harder he tugged and worked,
Vainly and savagely still he jerked;
The boot half on, *would* dangle and flap—
"Bother!" and then he burst the strap.

Redder than ever his hot cheek flamed;
Harder than ever he fumed and blamed;
He wriggled his heel and tugged at the leather,
Till knees and chin came bumping together.

"My boy," said I, in a voice like a flute,
"Why not—ahem!—try that troublesome boot
On the other foot?" "I'm a goose," laughed John,
As he stood, in a flash, with his two boots on.

In half the affairs of this busy life
(As that same day I said to my wife),
Our troubles come from trying to put
The left-hand shoe on the right-hand foot.

Or *vice versa* (meaning reverse, sir),
To try to force, as quite of course,
Any wrong foot in the right shoe,
Is the silliest thing a man can do.

THE PENNY.

In the mint where gold and silver and copper coins are made, a Ducat and a Penny had just been finished. They both now lay together, bright and clear, close on the table, and glittering in the sunlight.

The Ducat said to the Penny, "Low fellow, get away from me! You are only made of common copper, and do not deserve the sunshine. You will soon be lying on the ground all tarnished and black, and nobody will care to pick you up. I on the contrary, am made of precious gold. I shall therefore travel through the wide world among lords and princes, do great deeds, and at last even become a pearl of the king's crown."

In the same room, there lay on the bench by the stove a wise old Cat. When he heard the Ducat's speech he turned over on his other side, and, stroking his beard thoughtfully, said, "Turn about is just as likely." And it so happened that the fate of the two coins was just the reverse of what the Ducat had predicted.

The Ducat came into the possession of a rich old miser, who kept it in his money chest, where it lay for a time, idle and useless, among coins of its own rank. But as the miser foresaw that he must soon die, he buried all his money in the ground; and there the proud Ducat lies to this day, and has become tarnished and black, and nobody is ever likely to pick it up.

The Penny, however, was to journey through the wide world and come to great honors, which happened in this wise:

In the first place, a poor boy, employed about the mint, received it as wages. He carried it home, and as his little sister was greatly pleased with the bright new piece, he made her a present of it. The child ran with it into the garden, to show it to her mother. A sick and old beggar limped up to her, and asked for a piece of bread. "I have none," said the girl.

"Then give me a penny to buy some," said he. And she gave him the coin. He then hobbled off to the baker's. As he stood by the shop, there came up the street an old acquaintance, clad as a pilgrim, and carrying a staff and wallet. He gave to the children who stood about pictures of saints and other worthies, for which the children dropped money in the bag, which he held out. The beggar asked him, "Where are you going?"

"Many hundred miles further, to the city of Jerusalem, where the dear little Christ-child was born and died. I shall pray at His grave, and then redeem my brother, who is held for ransom by the Turks. For that purpose I am collecting money in this bag."

"Then take also for that purpose my mite," said the beggar, and he gave the penny to the pilgrim, and was about to go away as hungry as he came. But the baker, who had been looking on, and had seen the whole, gave the poor man the bread which he had meant to buy.

The pilgrim wandered through many countries, and sailed across the sea to the great city of Jerusalem. When he arrived there, he first prayed at the Holy Sepulcher, and then visited the Turkish Sultan, who had shut up his brother in prison. He offered the Turk a large sum of money, to set the captive free; but the Turk wanted more still. The pilgrim answered, "I can offer you nothing more but this penny, which a poor hungry beggar gave me out of pity. Be you as compassionate as he, and the copper coin will make you rich." Then the Sultan took pity, gave the prisoner his freedom, and received the penny from the beggar.

The Sultan put the copper coin in his pocket, and for some time afterward thought nothing of it. Then it happened that an Emperor came to Jerusalem, and made war upon the Sultan. The latter defended himself bravely, and escaped being wounded. Once, however, an arrow was shot directly at his breast, and struck him fair, although it glanced off from his garment without injuring him. He was astonished at this, and when, after the battle, they examined his clothes, they found in his pocket a copper penny, on which the arrow had glanced. Then the Turk held the penny in high honor, and had it fastened by a gold chain to the handle of his sword. But after this the Sultan was taken captive by the Emperor, and was obliged to give up his sword, which, with the penny, thus came into the Emperor's hands.

One day as the Emperor sat at table, and held in his hand a goblet of wine, the Empress remarked that she much wished to see the Turkish saber. It was brought in, and as the Emperor showed it to his wife, the penny dropped into the goblet of wine. He noticed it, and before he put the goblet to his lips, took out the penny. As he looked at it more closely, he saw that it had turned green. At that, every body knew that there was poison in the wine. A wicked servant had mixed it, in order to kill the Emperor. The servant was forthwith sentenced to death: but the Emperor had the penny set in his crown.

Thus the penny had pleased a child, secured bread for a hungry beggar, released a prisoner, saved the Sultan a wound, and the Emperor his life. For this it was set in the Imperial crown.

THE EARLY ADAPTATION OF GAS.

Gas, as most people know, is inflammable air given out by coal. But who first thought of collecting it and storing it, and using it to light up streets, houses and churches? The honor is due to a very busy, hard-working engineer, one William Murdoch, the foreman of Messrs. Boulton & Watt, the great engineers. It was when his real day's work was over that he devoted himself to experiments on the nature and use of coal gas, and at last he brought the discovery into such shape that he lighted his own house and offices with the new combustible air; and even contrived a lantern, with a bladder of gas fixed to it, to light him along the dark lanes of the country at night. This was at the close of the last century, and great was the amazement of the public when the clever foreman decorated his masters' mills, near Birmingham, with a blaze of light in celebration of the peace of Amiens in 1802.

So little was the invention understood and believed in by those who had not seen it in use, that even great and wise men laughed at the idea. "How could there be light without a wick?" said a member of Parliament when the subject was brought before the House.

Even Sir Humphry Davy ridiculed the idea of lighting towns by gas, and asked one of the projectors if they meant to take the dome of St. Paul's for a gas meter. Sir Walter Scott, too, made himself merry over the idea of illuminating London by smoke; though he was glad enough, not so long after, to make his own house at Abbotsford light and cheerful on winter nights by the use of that very smoke.

When the House of Commons was first lighted by gas, even the architect imagined that the gas ran on fire through the pipes, and he therefore insisted on their being placed several inches from the wall, for fear of the building taking fire; and members might be observed carefully touching the pipes with their gloved hands, and wondering they did not feel warm.

The first shop lighted in London by the new method was Mr. Ackermann's, in the Strand, in 1810; and one lady of rank was so delighted with the brilliancy of the gas lamp on the counter that she asked to be allowed to take it home in her carriage.

Mr. Murdoch was, however, too busy with his other pursuits to continue to study the uses of gas, and though he was undoubtedly the first to apply it to practical purposes, many others laid claim to the honor, and other people quickly reaped the benefit of his cleverness and ingenuity.

HE DID IT FIRST.

There were once two sheep who lived in a field. One was black and one was white. In the same field lived a horse and a cow. Now the black sheep was not at all good. But where he chose to go the white sheep would go; and what he did the white sheep would do.

So they did what they ought not. And when the white sheep was asked why he did what he ought not he would say, "The black sheep did it first!" One day a boy went through the field, and did not shut the gate. The black sheep saw it, and ran out of the field with great glee. The white sheep saw it too, and they both went the same way.

But soon they met a large dog, who knew that they ought not to be out in the road. He ran at them and bit them, and tore some wool off their backs. They were glad to run back to the field; and the white sheep was quite ill with fright all the rest of the day.

"But why did you go?" said the old cow. "The black sheep went," said the white one; "he did it first."

Well, the gate was shut; but one day the black sheep found a way out of the field through a hole in the fence. He crept through the gap; and, of course, the white sheep crept through as well. They got out on the moor, and thought it fine fun to be there, with no one in sight.

Soon the black sheep, who was first, came to the edge of a deep pit. He gave a great jump and leaped in.

The white sheep did not stop to think. He gave a great jump and leaped in too. Down, down, down he fell, on a heap of sharp stones. Both he and the black sheep were much hurt. They could not get out, and were forced to lie there in great pain. By-and-by some men came by, and saw the sheep in the pit. The men got them out, and took them back to the field, and sent for some one to see what could be done for them.

The horse and the cow, in great grief, came and stood by the side of the white sheep as he lay on the grass. They were fond of him in spite of all his faults. "Oh, why!" cried the cow, with tears in her eyes (and the bell that was hung round her neck shook and rang as she leaned over him),

"why did you leave the field with the black sheep?"

"He did it first," said the white one in a faint voice.

"Then why did you jump down that steep place? Could you not see that it was a pit?"

"I did not stop to see. He did it first," said the white sheep. Then, with a groan, he went on to ask, "How is the black sheep? Is he here too? And what does the man think who comes to see us?"

"I grieve to tell you," said the cow, "that he thought you were both too much hurt to live. The poor black sheep has just died, and I fear that you must die too."

"He did it first," said the white sheep. And with these words he died.

HOW BOYS' MARBLES ARE MADE.

Almost all the "marbles" with which boys everywhere amuse themselves, in season and out of season, on sidewalks and in sandy spots, are made at Oberstein, Germany. There are large agate quarries and mills in that neighborhood and the refuse is turned to good account in providing the small stone balls for experts to "knuckle" with. The stone is broken into small cubes by blows of a light hammer. These small blocks of stone are thrown, by the shovelful, into the hopper of a small mill, formed of a bedstone, having its surface grooved with concentric furrows. Above this is the "runner," which is of some hard wood, having a level face on its lower surface. The upper block is made to revolve rapidly, water being delivered upon the grooves of the bedstone, where the marbles are being rounded. It takes about fifteen minutes to finish a half bushel of good "marbles," all ready for the boy's knuckles. One mill will turn 160,000 "marbles" per week. The hardest "crackers," as the boys call them, are made by a slower process, somewhat analogous, however, to the other.

The Puzzler.

ILLUSTRATED REBUS.

HIDDEN CHAMBER ARTICLES.

1. Let us take this car, Peter.
2. My pupil lowered the sail.
3. Quench air from our lungs and death will follow.
4. Greta blew the supper horn.
5. 'Twas a feat her bed-ridden mother could not survive.
6. Pitch Ernest his cap.
7. In this ward Robert cannot vote.
8. I cannot tie my bow, Lily.
9. While I was in Marseilles Count Erpanex was wed.
10. She etherized the patient.
11. You can wash, standing there.
12. Marking that fancy towel racked my brain.
13. You must make your toilet, Mattie.

PUZZLER ANSWERS.—Sept. 9.

Illustrated Rebus.—Fond memory of the departed will cling like the ivy to the fallen willow.

Decapitations.—1, Clover—lover; 2, Sham—ham; 3, Sloop—loop; 4, Sample—ample; 5, Cat—at; 6, Table—able; 7, Sharp—harp; 8, Shovel—hovel; 9, Chair—hair.

Miscellaneous Enigma.—The Star Spangled Banner.

Double Acrostic.—Initials, Nectarine; finals, Pineapple.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

The following is a graduated scale of prices for small clubs according to the reduced rates of subscription for the Rural New-Yorker. This is done for the benefit of the small clubs in thinly-populated districts. Let each subscribor add two or three names to his own and remit for all at one time.

No.	Single Price.	Small Clubs.	No.	Single Price.	Small Clubs.
1	$2.50	$2 50	6	$15 00	$13 20
2	5 00	4 90	7	17 50	16 05
3	7 50	7 20	8	20 00	16 80
4	10 00	9 20	9	22 50	18 45
5	12 50	11 25	10	25 00	20 00

News of the Week.

HOME NEWS PARAGRAPHS.

The N. Y. State Fair, held at Albany this year, made the finest display of live stock seen for many years. It was specially good in Devons and Jerseys.

The funeral of ex-Gov. Henry A. Wise has taken place at Richmond, Va., from St. James's Episcopal Church. There was an immense concourse of citizens of all classes and nationalities. The procession embraced all the white military companies of the city, veterans of the Wise brigade, Catholic, Irish, and German societies, Masons, members of the legal profession, and a large number of other citizens. Along the line of march the streets were crowded with people, who followed the procession to Hollywood Cemetery, where the remains were interred. The floral tributes were numerous. The State and city officials, including Gov. Kemper and staff, also attended the funeral. The State and city offices were closed during the greater portion of the day, and the Federal and State flags were displayed at half-mast on the Capitol.

The suffering at Savannah in consequence of the presence of yellow fever is terrible, and aid is earnestly asked.

James W. Booth, State Senator, elected to the Senate by the Republicans of the Vth Senatorial District, of this city, died at the residence of his brother-in-law, Quintin McAdam, at Nyack on the Hudson, on the 14th inst.

The yellow-fever panic in Savannah is subsiding. Ladies have resumed their shopping, children are playing in the squares, and the exiles are returning. The Benevolent Association has done noble work in the city.

The second Democratic Convention (N. Y.) has nominated Lucius Robinson for Governor.

The daily attendance at the Exhibition ranges above 60,000 now.

Gen. Terry's column has been broken up for the season.

Fifteen thousand people attended Governor Rice's (Mass.,) reception at the Centennial.

The Unitarian Conference has adjourned to meet at Saratoga again in two years.

Pennsylvania Day (Sept. 28) will be observed as a holiday in Philadelphia. No business will be transacted except that in hand, viz., Going to the Centennial.

Two more explosions occurred at the powder mills in Warren, Me., Sept. 14th, while the workmen were absent at the funeral of those killed the day before.

The International Rifle Match at Creedmoor resulted in a signal victory for the American Team. At the close of the first day they were nine points behind the Scotch and five behind the Irish Team. The second day their final score of 3,126 points left them 22 ahead of the Irish, who were second with a score of 3,104 points, and 64 over the Scotch, who netted 3,062 points in the two days' shooting. The Australians finished with a score of 3,061, and the Canadians were last with a record of 2,023 points. On the evening of Sept. 15 the Teams assembled in Gilmore's Garden, and in the presence of some 8,000 spectators the trophy was presented to the victorious Americans. Speeches were made by Gen. Hawley, Major Fulton, Judge Gildersleeve and others. The greatest enthusiasm was manifested, generously embracing victors and vanquished.

Lieut.-Gen. Sheridan and Col. M. Sheridan passed through Omaha, Sept. 14, en route to Fort Laramie, where they are to meet Gen. Crook in a few days to arrange for a vigorous prosecution of the Indian war through the coming winter, and the establishment of a large cantonment in the Powder River country.

Mr. E. T. Hayes, who lives a short distance below Greene, New York, brought an apple into Oswego that had actually been baked in the sun during the hot weather.

Hallett's Reef, which has long been a source of danger to navigators of Hell Gate, N. Y., will be destroyed, as a reef, by the time this notice is seen by our readers. The debris which will result from its destruction will next have to be removed to insure a safe channel. It has been estimated that one sailing vessel out of every fifty that now attempts the channel meets with some accident. Surveys of the channel and estimates of the cost of removing the various rocks, as well as Hallett's Reef, have been several times made at the expense of the Government. Something was done toward improving the channel by M. Maillefert, who began operations in 1851, having a fund of $13,000, which was raised by subscription among the citizens of this city. His method was surface blasting—letting a charge down against the rock and exploding it—and the results were more or less favorable, according to the shape of the rocks. The work has reached its final stage. Workmen are at present busily engaged loading the holes, 3,678 in number. The columns or supporting pillars, 172 in number, are pierced from floor to roof with holes, and the roof also. The holes are arranged in groups of 20, and each hole is filled with a white pine plug, on the end of which is a piece of tin, with its number—from 1 to 20—stamped upon it. All the plugs in a group are connected with a string, which passes from one to the other, thus preventing any confusion in separating group from group. The cartridges are delivered at the Government works packed in boxes. They are tin cans from 1¾ to 2⅝ inches in diameter and about 22 inches long, filled with explosive material. There are three classes of these cartridges of three different degrees of strength. The late unfortunate accident has caused the men to appreciate the power of the material they are handling, and they move the boxes containing the cartridges with the utmost care. In charging the holes, a plug is withdrawn and a cartridge of the least explosive force inserted. This cartridge is pushed back to its place by means of a long pole; another of higher power follows it, and then another of a still higher grade, after which the plug is returned to its place. The plugs will be taken out when all of the holes have been filled, when small exploding cartridges of dynamite, with fulminating caps, will take their places. The dynamite, being the hardest to explode, is placed next the fulminating mercury contained in the caps, which is the greatest detonator of all. All the exploding cartridges of a group will be connected by a wire running from one to another, the ends of which will be connected with the electric battery by two other wires, called leading wires. The battery will be placed in a bomb-proof structure a short distance from the shaft. The circuit will be connected, at the last minute, by Gen. Newton, who, with his staff, will occupy a position on a high point of land back of the mine, and the circuit will be closed by means of a small battery and connecting wires at that place.

A Times special correspondent with Gen. Terry telegraphs, under date of Fort Buford, mouth of the Yellowstone, Sept. 8:—"The final breaking up of Gen. Terry's command occurred yesterday morning, and all the troops are now en route for home, with the exception of two regiments of infantry, which will winter at the mouth of Tongue River. The Montana troops, numbering 250 infantry and 120 horse, and including 70 infantry and the Second Cavalry, under Gen. Gibbon, left for Fort Ellis, with a wagon train and supplies for eighty days. They will follow the old Stanley trail. The route is teeming with hostiles, and is 420 miles long. They may encounter a large war party in the Big Horn country. They have been in the field since March, and are poorly clad for the cold weather and fierce storms which sweep over the prairies at this season. The 22d Infantry have been left at the mouth of Glendive creek, and have begun the construction of a stockade. They will remain until Nov. 1, or later."

A dispatch just received from Gen. Sherman countermands the order to winter a regiment of cavalry on the Yellowstone, which renders a winter campaign impossible, and indefinitely postpones the subjection of the Sioux.

A tornado cut a swath through the northern part of the city of Bridgeport, Conn., about midnight on Thursday last. It unroofed a number of houses and snapped several large trees off near the ground. The tornado lasted about three minutes, and was apparently about 300 yards wide. It was accompanied by a rumbling noise, and the houses in its path shook as if an earthquake was coming.

The "Widow" Butler has received the Republican nomination for Congress in his district.

The dairymen of Washington County, N. Y., suffer the most severe privations from the drouth. B. F. Baker, maker of the Salem factory in that county writes:—"We have been making thirteen cheeses a day (the present number reported is six), and unless we have rain soon, we shall have to fodder." Similar intelligence comes from Whitehall.

FOREIGN NOTES.

A dispatch from Berlin says the intolerant measures of the Spanish Government against Protestants are said to have given rise to a frequent exchange of notes between the British and German Governments. It is understood they will address remonstrances to Spain on the subject, and call upon her to act in conformity with her engagements.

A dispatch from Constantinople says the Porte has informed the Ambassadors of the Powers in reply to their representations made on Sept. 9th, that it is impossible to grant an armistice, but the Porte is prepared to accept peace based on the following points:

First—The reoccupation of the fortresses which were held by Turkey previous to 1857.

Second—The destruction of the fortresses constructed by the Servians since 1857.

Third—The investiture of Prince Milan at Constantinople.

Fourth—The reduction of the effective Servian army to 10,000 men and three batteries.

Fifth—The construction of a railway across Servia.

A sixth point follows, which is indecipherable in the telegram. The Porte insists upon the necessity of the occupation of the principal Servian fortresses, so as to prevent fresh aggressions, and leaves the negotiation of a treaty on the above basis entirely in the hands of the Powers.

The General Committee of the Turkish bondholders has issued a circular embodying a scheme for permitting the Turkish Government to issue paper money to the amount of $40,000,000, to be legal-tender and bearing no interest. The whole amount is to be redeemed in ten years by half-yearly drawings of $2,000,000 each, and that sum is to be provided for by a deduction of 15 per cent. from the interest paid to existing bondholders. One of the provisions of the proposed scheme is that the Porte shall adopt what is known as the "Hamoud scheme."

A late dispatch from Belgrade says:—"The Turks made an attack Tuesday on Mali-Swornik to prevent the Servians sending reinforcements to Gen. Tchernayeff; but fighting on the Drina cannot influence the issue of the war at Alexinatz. A correspondent with the Turks says that their plan of operations is to cross the Morava, storm the Servian position at Deligrad, occupy it, and then return to take Alexinatz. Both positions are strong, and the task is one of enormous difficulty. The first attempt to carry out the plan by bridging the Morava on Monday, was unsuccessful."

The English Ambassador has remonstrated against Turkish depredations in Servia.

A dispatch from St. John, N. B., says that Hon. Joseph C. Yates, Member of the Privy Council of Bermuda, is dead.

The Servian line extends from near Djunis to Deligrad; there are 55,000 men under arms.

The forces of the Transvaal Republic have been defeated by the natives.

There were strong hurricanes on the evening of Sept. 12, at Antigua, St. Kitt's, St. Croix, and St. Thomas, West Indies. At midnight on the 13th a fearful hurricane passed over Porto Rico. All the telegraph wires were prostrated in Jamaica from the 12th to the 14th.

Intelligent Englishmen who have returned from the Centennial Exhibition are sounding an alarm in the London Times. "A Manufacturer," in a vigorous communication published on the 31st ult., pointed out the dangers to be apprehended from American competition, and three days afterward "A Practical Man" repeated the warning. "The Americans," he says, "have imported the very newest and best machinery of England, Belgium, Germany, and France; they have tempted away, through agents sent over for the purpose, skilled workmen from each of these countries, giving a preference, however, to those of England; and they are rapidly training an army of skilled workmen for themselves. I can say, from my own knowledge as a practical man, and from the statements of friends upon whom I can rely, that in the departments of iron, wool, cotton, and a certain class of silk, they can produce work which, in quality, is fully equal to our own. Out of their present commercial chaos order will surely come, and I fear in a form for which we are quite unprepared."

The Turkish Government has laid down the terms of peace with Servia.

There has been a strong hurricane in Antigua, Jamaica, and the eastern part of Cuba.

Craig Millar won the Doncaster Cup.

The German and British Governments will remonstrate with Spain for prosecuting Protestants.

The Empress of Germany and the Crown Prince have begged the Emperor to pardon Count von Arnim, and he is disposed to do so if the Count will acknowledge his faults and apologize to Bismarck like a naughty boy who has been whipped. It is said that the Count is inexorable.

VALUE OF ADVERTISING.

Noticing several articles of late in the Rural New-Yorker about advertising, I am prompted to send you a word in regard to my experience. First, let me say that many persons expect too quick returns for money invested in advertising. If one or any number of advertisements are placed before the public, they look for an avalanche of orders within a week or two, and if they do not come the money thus spent is considered as almost thrown away. It is probably needless to say to those who have had long experience that this is an error—for thousands of persons clip out an advertisement and carefully preserve it until their circumstances will permit of sending for the article desired. It is now more than a dozen years since I retired from business in your city and moved to my present residence, but letters are forwarded to me almost weekly in answer to advertisements which appeared in the Rural New-Yorker and other papers fifteen and more years ago.

Judicious advertising I have always considered one of the most *permanent* investments a man can make, if he has a good article for sale.

Yonkers, N. Y. Out of Trade.

INQUIRIES FOR ADVERTISERS.

[Owing to the many inquiries from subscribers concerning things that have a commercial value, and are offered for sale through the medium of newspaper advertising, we have deemed it for the best interest of all concerned, to classify our "Answers to Correspondents," so that each inquiry will appear under its appropriate head, either in "Inquiries for Advertisors," or "Answers to Correspond-

ents." This, we believe, will enable advertisers to more effectually comprehend the wants of our subscribers, and will enable us to make our advertising columns what they should be—a true reflection of our readers' wants. This department will be edited carefully, it being our aim to use it in the interest of both advertisers and readers (and we shall not hesitate to give our reasons for excluding bad or doubtful advertisements) and such other matter as will be of legitimate interest. At the same time it must be understood that such inquiries as may appear must appeal to the advertiser himself for answer. The advertisement should answer the want and the want is indicative of its need.]

M. B., Lawrence Co., Kan., says he has heard good reports of the Andre's King Oats, and wants to know where to get them.

R. B., Franklin Co., N. Y., wants pure Chester White Pigs.

H. Y. G., Dallas Co., Tex., wants a good Barb Wire Fence for herding purposes.

B. R. A., Steuben Co., N. Y., wants to know where Percheron Horses can be obtained.

W. A. B., Niagara Co., N. Y., wants to know where the Soluble Pacific Guano mentioned in the RURAL some time ago can be obtained.

G. R. F., Bucks Co., Pa., wants Holstein or Dutch Cattle.

F. A. M., Los Angeles, Cal., wants a good 10-horse Portable Engine for farm purposes; also, a Portable Saw-Mill.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 16, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	76,566	Molasses	—
Whisky	4,995	Rice, bbls	728
Corn meal, bbls	4,700	Cut meats, pkgs	10,546
Corn meal, bags	525	Lard, pkgs	4,969
Wheat, bush	217,905	Tobacco, hhds	3,229
Corn, bush	1,135,498	do, pkgs	5,928
Oats, bush	235,162	Butter, pkgs	38,103
Rye, bush	32,968	Cheese, bxs	73,815
Malt, bush	19,591	Cotton, bales	10,639
Barley, bush	31,233	Rosin	10,454
Beans, bbls	6,976	Spts. turp., bbls	2,690
Grass seed, bush	10,491	Dried Fruits, pkgs	1,671
Beef, pkgs	1,681	Eggs, bbls	5,775
Wool, bales	1,229	Peanuts, bags	268
Hops, bales	483	Leather, sides	50,930
Pork, bbls	3,281	Sugar, hhds	—
Tallow	1,153	Oil cake	6,806

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer liens here on Saturday.

BEANS AND PEAS.—Exports of beans past week, 1,569 bbls.; since Jan. 1st, 45,088 do.; same time last year, 21,487 do. Exports of peas past week, 1,202 bu.; since Jan. 1st, 476,000 do.; same time last year, 237,200. The demand for medium beans is moderate; extra marks of old in a small way have brought $1.30, which is the current rate for prime new; small lots, carload price, $1.25. Marrows active for export, with higher prices, but quoted quiet at $2. There is not yet much collection of other goods. A small, handsome lot of red kidneys brought $1.75. Black (or turtle soup) beans irregular, pending new crop. California Lima neglected while fresh-shelled are offering. Canadian peas remain dull. Green peas in fair demand; stock all sold. Southern Black Eyes are showing only in a sample way; no quotations yet. We quote:

Beans—New pea, $1.35@1 60; medium, $1.30; marrow, $2; old prime pea, $1.50@1.55; fair to good, $1.30@1.40; prime mediums, $1.20@1.25; fair to good, $1@1.15; prime marrows, $1.95@2.00; fair to good, $1.15@1 80; prime white kid., $1.70@1.75; other, 1.25@1 50; prime red kidney, $1.70@1.75; other, $1.40@1.50; Lima (Cal.) $2.75@3. Black beans, $3.25@3.50. Canadian peas, bulk and bond, 96@97c.; free bbls, $1.14. Green peas, $1.15@1.20; split do. $6.

BEESWAX.—There is a very slow business, and prices unsettled.

Western and Southern quoted at 31@32½c. Exports past week, 1,255 lbs.; since Jan. 1st., 86,607; same time last year, 61,414.

BROOM CORN.—Small lots of new have been received from Texas, Kansas and Ohio, but demand is small at present. Kansas green, partly hurl, is offered at 7c., with the range on the various grades nominally 4c. to 8c.

BUTTER.—The wave of strong prices continues unchecked and the market is active under the new prices for some grades. There is a conflict of opinion as to the full yield. In some sections farmers are holding tightly upon their stock of fine with a view to future high prices. Again some of the larger producing sections entertain no fear of a seriously reduced stock. In the Chenango district, pasture has renewed elegantly, and a good seasonable style of butter is already coming forward. Other places, especially in the vicinity of Rome report that farmers are compelled to feed largely thus early. Western butter is active, sells to foreign shippers direct from the wharves. The indications are that we shall have a steady export trade for some time. Dairy products abroad are reported as greatly under the average yield both on the continent and in Great Britain. Shippers are paying an advance of 1c. compared with previous purchases. Exports of butter past week, 17,021 packages, including a few State Welsh tubs.

We quote:—Choice pails, 33@34c.; prime, 28@33c.; poor to good, 20@25c.; creamery pails, choice, 33@35c.; good, 30@32c.; sweet cream pails, 27@34c. State firkins, choice, 32@32c.; fair to good, 25@29c.; do. half firkin tubs, choice, 32@—c.; fair to prime, 27@29c.; do. Welsh tubs, choice, 30@32c.; other, 24@28c.; Western creamery, choice, 31@34c.; other, 30@32c.; do. firkins, best, 21@22c.; other, 17@20c.; dairy tubs, choice, 25@27c.; other, 18@22c.; factory choice, 23@25c.; other, 16@18c.

State dairies quotable at 29@32c., though few are in. Most of the long lines are yet made up of farm lots.

CHEESE.—Exports past week, 61,320 boxes. A sharp rise in the interior markets this week sent prices up here above 1c. ₩ lb. Exports have been forced to operate reservedly, as the English markets have scarcely fully responded. Receivers, however, have shown confidence, and the transactions at the close are at 12¾@12¾c. for fancy factories, chiefly the higher price, with 13c. paid for some exceptional lots. The quotations are:

Fancy factory, 12¾c.; fine, 12¾c.; good and prime, 11¾@12c.; fair, 10@11c.; State farm dairy, fancy, 11¾@11¾c.; good to prime, 10@11c.; fair and good, 9@10c. Western factory, good and prime, 9¾@10¾c.; fair lots, 8¾@9¾c.; do, cheddar, choice, 11@11¾c.; do. flat, choice, 11@11¾c.

CIDER.—The supply of new is large and likely to increase, as a good many early apples will be forced to go to the mill this season. Pure offered at 8c.

COTTON.—The Agricultural Report, issued recently, has indicated a better condition of the crops than has been anticipated and prices have worked easier with, at the decline, spinners buying freely.

The latest quotations are:—September, 11 7-32@11¾; October, 11 7-32@11¾c.; November, 11¾c.; December, 11 9-32c.; January, 11 13-32@11 7-16c.; February, 11 19-32@11¾c.; March, 11 25-32@11 13-16c.; April, 11 31-32@12c.; May, 12 5-32@12 3-16c.; June, 12 11-32@12¾c.; July, 12¾@12 17-32c.; August, 12¾@12 11c.

Quotations for spot cotton, based on American standard of classification:

Strict ordinary	9 13-16	Middling	10¾

DRIED FRUITS.—Business is still unsatisfactory. Southern apples come in freely, but of grade not required by exporters, while the home trade is small; Southern quarters have been sold at 4¾@5c., and some repacked lots for shipment at 6c. Peaches are dull and weak; sales small at 14c. for prime picked. Blackberries are scarce and at full prices, as well as raspberries and cherries.

Apples—State, sliced, 6¾@7½c.; do., quarters, 7c.; southern sliced, new, 6@6¾c.; choice do. at 7@8c.; do., new quarters at 5@6c. Blackberries, 8c. Peeled peaches, new, nominally 13@14c., as to quality; unpeeled peaches, new, nominal. Plums at 13@15c. Raspberries, 25c. Cherries, 16c.

EGGS.—Prices have been something above present rates, which compare about with last week's. Buyers hold off a little and there is a shade of weakness. Sellers think that prices will recover, as receipts are not oppressive and the city demand is enlarging by the presence of a large number of strangers and the usual fall return of our recent absentees. We quote:

Near points, 23@25c.; State and Penn., 22@23c.; Western, prime, 22@23½c.; do. other, 21@21½c.; Canadian, 21@24½c.

ESSENTIAL OILS.—Peppermint—The crop of 1876 is one of the largest ever known and oil is now rapidly being put on the market. Farmers are anxious sellers at $2@2.25 ₩ lb.; indications of decreased demand and increased supply ruling at lower prices. Wintergreen—$2.50 ₩ lb.—the lowest for many years. The increased Southern production is now keeping more than a supply the year round. The same can be said of Sassafras oil, which is now 40@42½c. Pennyroyal very abundant, showing a decline from $3 to free sales at $1 ₩ lb.

FEATHERS.—The market is more animated as the stock is more suitable for buyers for manufacture, prices tending in seller's favor for prime. Prime live geese, 50@55c.; mixed, 35@40c.

FLOUR.—This market has been in very good shape the past week. Exporters have bought freely and low. Grades and Minnesota extras have been in active demand. Supplies generally are very much reduced and prices are higher. The quotations are:

For poor to very choice superfine State, $3.00@4.65; $4.85@5.00 for very common to fair extra do.; $5.05@5.10 for good extra do.; $5.15@5.40 for fancy do., and $5.45@5.50 for very choice extra; $4.00@4.55 for superfine Michigan Indiana, Iowa, &c.; $4.85@5.00 for shipping extra do., the inside price for inferior, and $5.05@5.10 for choice to very fancy extra do.; good to choice white wheat extras at $5.45@5.50; fancy do. $6.55@7.75; winter wheat, good to choice family city mill extras, $5.00@7.50; round-hoop Ohio, $4.85@5.00, and trade brands of do. at $5.05@6.75; St. Louis, $5.00@5.25 for common to fair extra, and $5.30@8.50 for good to very choice; Minnesota "straight" at $5.35@7.75, and patent at $6.75@9.50; unsound stock at from $3.85@5.75; city mill extra for West Indies at $5.30@5.10; do. English brands, $4.90@5.00; do. trade and family brands, $5.30@8.50; No. 2 at $3.00@3.75. Corn meal—Yellow Western, Jersey and Pennsylvania, $2.65@2.90; Brandywine, $3.30.

FRESH FRUITS.—Near-by apples are abundant and prices generally low. Some good double-headed new just begin to arrive. Those which have lasting qualities realize the extreme. Grapes have hardly a price, the stores being actually black with them, while retailers are well filled up. New Jersey supplies the peaches. Plums are doing a little better. Pears have advanced, with some sale for the other varieties since. Bartletts went $10 for prime. Melons are low—their welcome is waning. Peanuts are in fair demand; prime are higher. A few cranberries are offering, but it is too early for them, especially the inferior sorts.

Apples, State, prime, ₩ bbl., $1.50@2.12; river, $1.25@1.50; common, 75c.@$1. Peaches, fancy, ₩ basket, 75; good, $2.50@1.00; small, 50@75c. Pears, Bartletts, ₩ bbl., $8@10; common, $5@7; Seckel, $4@9; Louise Bonne, $4.50@5.50; Flemish Beauty, $4@5; cooking, $2@2.50. Plums, choice, table, ₩ bbl., $10@12; common to good preserves, $6.50@9. Grapes, Delaware, boxes, ₩ lb., 7@8c.; loose, 7@9c.; Concord, boxes, 4@5c.; loose, 2@3c. Nutmeg melons, best, ₩ bbl., $2.50@3; common, $1@2. Watermelons, ₩ 100, $5@18. Virginia peanuts, $1.50@1.60; other, $1@1.35. Cranberries, 2@3c. ₩ box.

FURS AND SKINS.—Mail advices from the recent London sales report a decline of 15 ₩ cent. in muskrat, and the best grades of mink; of 30 ₩ cent in skunk; 35 ₩ cent. in opossum; and 10 ₩ cent. in wolf and red fox, as compared with the prices of last March. In other kinds no important changes occurred. The sale results in a considerable loss to shippers and prospects for the future are not bright. Skins will have to be sold low to find a market, either at home or abroad. The advanced prices paid here for mink, following the March sales, prove to have been unwarranted; they were based upon an anticipated advance in London which did not occur.—*Producers' Price Current, N. Y.*

GRAIN.—The wheat market has been very slow. Advices from the other side give a little strength, but the trade is chiefly turned to flour. Latest sales are of ungraded spring at $1@1.03; poor old No. 2 Chicago spring at $1.08; No. 1 spring at $1.15@1.20; winter red western at $1.23; white Michigan, prime to extra, at $1.31@1.32; new white Michigan at $1.25. winter red western to arrive end of this month, at $1.22. For No. 2 Chicago and No. 2 Milwaukee spring of prime quality, $1.17@1.19 quoted. A small lot of buckwheat from the state, the first, $4 ₩ 100. Rye has been wanted by German shippers at full prices; western at 71@75, and state at 85@90. For new barley 95 is bid for four-rowed state, and $1 asked. Corn has been in brisk export demand, and is higher; latest sales at 56¾@58 for western mixed, 58 for western yellow, and 57@62 for white western. Oats have been in liberal trade and speculative demand and rule at better prices; latest sales are 34 to 47¾ for mixed western and state, and 42@49 for white do.

HAY AND STRAW.—The receipts run small, while there is a good demand for prime lots of hay, and at full prices.

Bale hay is quoted:—Shipping, 50c.; retail qualities 71@$1c.; clover, 55@60c.; salt, 55@60c. Straw is quoted at 70@80c. for long rye; 55@95c. for short rye; 55@60c. for oat.

HIGHWINES are held at $1.11, with a light amount of trade.

HONEY.—Some is arriving, but there is no demand, nor likely to be until fruit is out of the way.

HOPS.—The exports for the week are only 120 bales; this light movement is chiefly owing to the small receipts. Firm rates are held and made on the few transactions. The new crop is now nearly harvested. The quality, as a rule, will hardly come up to last year's crop. A few purchases have been made in the interior at 30 cents, but growers generally are asking more money. The trade, and in the country, is almost at a standstill; growers demanding more for their hops than buyers at present feel warranted in paying. A few days more will be likely to settle the question. If our hops can be used by German brewers, and if they have got to have them, a few cents ₩ m above the present price will not stand in the way. The quotations are

New Yorks, good to choice, now	30 to 38
New Yorks, low to fair, now	25 to 28
Eastern, new	25 to 30
Yearlings	10 to 20
Olds, all growths	4 to 8

POULTRY AND GAME.—Live poultry is in good demand being more generally used. Prices strong. Demand for Turkeys growing.

Spring chickens, near-by, ₩ lb., 16@—c.; do. Western, 14@15c.

Fowls, N. J., ₩ lb 16@18c.; do. Western, 16@17c. Roosters, 8@10c.; Turkeys, N. J. 16@18c.; do. Western, 15@16c.; Ducks, N. J., pair, 75c.@$1.12; do. Western, 65@75c.; Geese, N. J., $2.00@2 50; do. Western, $1.37@1.75.

Some lots of dressed are arriving without ice in good order, but it is too soon to risk it.

Dry-picked chickens, 18@20c.; scalded, 15@17c.; dry-picked fowls, 17@19c.; scalded, 15@18c.; turkeys, 16@20c.

Game—Demand fair with an increased variety favoring buyers in prices. Partridges, ₩ pair, 75@90c.; grouse, do., 70@80c.; woodcock, do., 70@85c. wild ducks, Red Head, 60@70c.; mallard, 50@60c.; common Teal, 25@30c.

PROVISIONS.—There has been a pressure to sell, which has led to lower prices. This has been brought about by the decreased movement on export account of stocks on hand, with the consideration of the incoming new packing, which is believed to be an exceptionally heavy one. Mess pork quoted at $17 for spot lots, September and October deliveries, and $15.70 for December delivery. Bacon, long clear, 9¾c.; long and short together, 9¾c.; short, 9¾c. Western steam lard, $10.75 for spot and September delivery, $10.90 for October, $10.05 for November, $9.80 for December. Stearine at 12¾@12¾c. for mixed lots. Beef hams at $25@25.50 for Western choice; barreled lots are quoted: $8@10 for plain mess, $10@11 for extra mess. Tallow at 8¾c. for prime.

SEED.—The trade await with some interest arrivals of new clover, which are probable next week; meanwhile, no important bids. New timothy is selling at $1.80.

SUNDRIES.—Ginseng, ₩ lb., Southern, $1.15@1.30; Seneca root, 75c. Cider, ordinary to refined, 14@18c. ₩ gal.; cider vinegar, 18@25c. Sheep skins clipped, 30@35c.; do. nuclipped, 50c.@$1; lamb skins, 60@65c.

TOBACCO.—Exporters have bought freely, and there is a very firm market.

KENTUCKY LEAF—NEW CROP.

VEGETABLES.—Potatoes steady at the reduced rates. Sweet are in heavy supply and easy. Tomatoes lower, the family demand having somewhat subsided. The general demand on garden truck is not active. We quote:

Prime potatoes, bbl., $2.52@2.75; fair, $2@2.25; sweet, $3@3.37. Corn, ₩ 100, $1@1.50. Tomatoes, ₩ bush, 60@75c. Marrow squash, ₩ bbl., 75c.@$1. Cabbages, ₩ 100, $5@8. Russia turnips, bbl., $1@1.25. Egg plants, ₩ 100, $3@8. Wax beans, ₩ bag, $1@1.25; Lima, 75c.@$1; shelled do., bush, $3. Cauliflower, bbl., $13@16. Yellow onions, ₩ bbl., $2; red, $1.50@1.62; white, $2.50@3.25.

WOOL.—There is a liberal business and a very strong market at an advance. Western fleeces, combing and delaines, Texas and California have most attention and wanted in larger lots by manufacturers. Ohio X and Pennsylvania fleeces at 41c.; XX do., 43c.; No. 2 and No. 1 do., 33@42c.; coarse do., 33@36c.; combing, 42@47c.; Western fleeces, 37@40c. for X and XX; No. 2 and No. 1 do., 33@36; coarse, 31@32c.; combing, 42@47c.

ROCHESTER, Sept. 16.—Flour market active; spring, $6.50; amber winter, $6.75; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.00. Wheat lower; Milwaukee club, $1.10@1.15; amber winter, $1.05@1.12; white winter, $1.12@1.20. Oats, nominal at 38@40c. Corn quiet at 59@62c. Corn meal, $1.25@1.50. Butter, 23@25c. Cheese, 10@11c. Eggs, 18@20c. Lard, 10¾c. Apples, bu., 40@60c. Potatoes, bu., 60@75c. Beans, ₩ bu., 70@90c. Mess pork, $17.25. Wool, 20@33c. Hay, $20@11. Straw, $6@8. Timothy seed, $1.90@2.25; clover, $6.00@6.50. Mill feed strong at $18 for shorts, $18 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 40c. ₩ bbl.; to New York, 30c.; to Albany, 25c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Sept. 16, 1876.

AT Little Falls, for the week ending Sept. 16, there was a good market for dairy products. Prices advanced fully 1½c. over quotations of last week. About 497 boxes of farm-dairy cheese were sold at from 9¾c to 12c. Five thousand four hundred and six boxes of factory cheese were disposed of, 23 lots of which brought 12¾c.; 23 do., 12¾c.; 3 do., 12c.; 1 do., 11¾c.; 1 do., 11¾c.; 1 do., 11c.; 1 do., 10¾c. The advance this week was somewhat unexpected by dairymen. It began on dairy cheese, which steadily tended upward until 12c. was reached for fine goods. It was claimed by some buyers that the market could not sustain this figure, and where factorymen asked the usual advance on their cheese, it was only after a good deal of talking that it could be obtained. Quite a number of salesmen "held over," saying that their August cheese would be the best of the season, as they were now skimming the milk at the factory which patrons were drawing but once a day. A few such forwarded their goods to be sold on commission. Butter brought from 25c. to 31c., about 100 packages having been sold.

We have advices from England to the first week in September. Our London correspondent says, English cheese quiet; a good sale for American; Dutch again dearer; some agents hold for 60s. Quotations are as follows:

American, extra fine, 32s.; fine, 48@50s.; good, 44@46s.; secondary, 30@42s. English cheddar, 74@80s.; Wiltshire double, 56@58s.; Cheshire, medium, 60@76s.; fine, 70@78s.; Scotch, 50@56s.

The change to cold weather has had no influence on butter; on the contrary, all descriptions are dearer, and fine is unprecedentedly scarce for this period of the season and the feeling strong in favor of still higher rates. We quote:

Clonmels, 140@144s.; Corks, 132@140s.; Dorsets, 160s.; Jersey, 130@132s.; Normandy extra, 120@150s.; American and Canadian, 90@96.10

BEEVES.—Monday last trade on a heavy run of generally coarse quality horned cattle fell off freely ½c. ₩ lb., still all the herds to hand were sold off when the markets closed at noon. Prices were 8@11c. ₩ lb.; weights, 6@9 cwt., strong. Wednesday, trade very slow, at 8¾@10c.; weights, 6¾@7¾ cwt. Thursday, sales very light, at 8¾@10c.; weights, 6¾@7¾ cwt. Friday, the markets closed dull at 8@10¼c.; weights, 5½@8¾ cwt. General sales were effected on 56 lbs. to the cwt.; extreme range, 55@57 lbs., net. Spanish herds, direct from the Plains, sold at 7@8c. ₩ lb.; corn-fed do., 9@9¾c. Native steers, 7¾@9¾c.; part corn-fed do., 9@9½c.; grade do., 10¾@11c. Bulls, on live weight, $2.35@3.15c. cwt. Oxen, corn-fed, 9@10c. ₩ lb. Mixed herds, 8@10c.

MILCH COWS.—Trade in fresh cows very slow at $35@50 ₩ head, with 3 head sold at $55@60; 38 springers sold at $35—calves always included.

VEALS AND CALVES.—Sales extremely slow in both veals and calves. Coarse quality veals sold at 7½@9¾c. ₩ lb.; coarse quality calves part grass-fed and part buttermilk-fed, sold at 3¾@6c. ₩ lb., also at $6@15 ₩ head. State veals at 8@9c.; Pennsylvania do., 7¾@9c.; Jersey do., 8¾@9¾c.

SHEEP AND LAMBS.—On Monday trade opened slow, with a falling off of ¼c. ₩ lb. on both sheep and lambs. Sheep sold at 4@6¾c. ₩ lb.; lambs, 5¾@6¼c.; mixed flocks, 5¾@6¾c. The markets closed weak. Wednesday, trade dull; sheep, 4¼@6c.; lambs, 5¼@7c. Thursday, sales slow; sheep, 3¾@5½c.; lambs, 4¾@6¾c. Friday, the markets closed dull; sheep, 4@5¾c.; lambs, 5@6¾c. State sheep, bucks included, 4@6¼c.; Canada do., 5@6c., with bucks at 4c.; Ohio do., 4¼@6¾c.; Pennsylvania do., 5¼@5¾c.; Indiana do., 5¾@6c. Delaware lambs sold at 7@7¾c.; State do., 5¾@7c.; Canada do., 6@7¼c.; Kentucky do., 5@6¼c.; Pennsylvania do., 6¼c. The general quality of these flocks were from fair to good.

HOGS.—Trade inactive: 123 Ohio hogs, 183 lbs., live weight, ₩ head, sold at $6.75 ₩ cwt.; 91 Ohio do., 200 lbs., live weight, ₩ head, sold at $6.87½ ₩ cwt. City dressed sold at 7¾@8¾c. ₩ lb., with an extremely slow demand on a moderate run.

HORSE MARKET.—Owing to the broken weather, trade has been small and sales slow: 21 roadsters, not warranted sound, being in general aged, sold at $190@235 ₩ head; 9 do., with fair trotting action, believed sound, sold at $295@330 ₩ head; 5 poor quality saddle horses sold at $100@225 ₩ head; 19 do. light harness horses sold at $50@75 ₩ head; 42 coarse do. do. sold at $110@155 ₩ head; 7 heavy draft horses of a coarse quality sold at $125@135 ₩ head; 1 pair do. of choice quality sold at $600; 3 pairs family carriage horses sold at $300@500 ₩ pair.

Eastern office, A. J. COCHRAN, 76 John St., N. Y.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *ten hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

PERSONAL ITEMS.

It is queer, but farmers seldom have hay fever.

The average hight of the American white man is 67.67 inches.

Chinamen and Indians hate each other upon acquaintance.

A revival of business is noticed in the Virginia City police court.

Lawrence Barrett, the tragedian, sprang from a printing office.

The Turks claim that the Bulgarian atrocities are not Haliz bad as reported.

The Centennial Department of Public Comfort disposes of $30,000 oysters daily.

It will be "Moody and Stebbins" at the Chicago revival meetings this winter.

Bunyan's grave is said to be almost unrecognizible through neglect. Is this Progress?

Gov. Beveridge has been removed from Rockford to Chicago, and is much better.

The Paris Figaro advises its readers to distrust "fair complexioned women with wide mouths."

Sergeant Bates, Dr. Mary Walker and Weston are kindly invited to the Valley of the Big Horn.

Dr. George B. Winship, the athlete, died in Boston a few days ago, at the age of forty-two years.

Why should it be easy to break in an old man's house? Because his gait is broken and his locks are few.

A German friend of ours notes the fact that the pie-stands generally attract a good many py-standers.

The only time when a man, however active, is apt to lie about the house is when he wants to dispose of it.

Mr. George Bancroft is working in the literary way at Newport, and is said to be more like a man of 45 than of 70.

Wagner has erected a tomb in the garden attached to his villa at Bayreuth, in which he wishes to be buried.

In Texas they hang horse thieves, but in alluding to the subject they put it:—"Equine extractors suspended in the forest."

The largest library in Prince Edward Island is owned by a wealthy cattle dealer named Webb who can neither read nor write.

Mrs. Partington knowingly inquires if a man who dips a can in a tank of water should be regarded as a can-tank-erous man.

When you see a man with a very red nose it's all right if his forehead is white. He's been down to the seashore and got sunburned.

A Frenchman got exceedingly angry with a waiter at an English hotel. "You rascal," he exclaimed, "I blow your nose for you!"

A London dray man recently succeeded in driving away with a couple of stolen pianos. He must have traveled at a two-*forte* gait.

The Marquis Mantegazza, charged with forging the name of Victor Emanuel, King of Italy, has been sentenced to eight years imprisonment.

A fashionable young lady, dressed in the most stringent style, accounted for her haste recently by saying that "time and tied wait for no man."

The British war vessel Fantome left Victoria, British Columbia, Sept. 5, to plant cannon about the grave of Capt. Cook on the Sandwich Islands.

Mr. Maurice Strakosch declares that he is going to build an opera house in San Francisco that will cost $1,000,000, and a large concert hall in Chicago.

The fund for James Lambert, Charles Reade's "hero and martyr," has been revived, as its object is in want. Wilkie Collins has subscribed two guineas.

In the show-window of a Chicago pawn shop is exhibited a magnificent diamond set, said to have been the property of the Empress Eugenie. It is held at $25,000.

One-third of the year's applicants for admission to Middlebury College, Vt., have been rejected on account of the elevation of the standard of qualification.

The first bond issued of the new 4½ per cents. was bought by Senator Robertson of South Carolina. It was a $5,000 bond, and for it he paid $5,037.50 in gold.

An exchange says Boston has 30,000 shop-girls. They all belong to the "Society of Minerva," and carry ten-cent tintypes of Ralph Waldo Emerson in their bosoms.

"I am indeed very much afraid of lightning," murmured a pretty girl during a storm. "And well you may be," said her despairing lover, "for your heart is made of steel."

Even the New York cigar-butt gatherers complain of dull times. They say the stumps are fewer in quantity, poorer in quality, and much shorter than in the good old times.

The Troy Press says:—"Two glasses of lager for five cents in Hudson. People are just beginning to find out why all the temperance societies go to Hudson with their excursions."

A little five-year-old of Dorchester somewhat surprised his mother a few days since with the remark:—"God is everywhere; he is all over me; and when you spank me you spank God!"

Names are sometimes oddly suggestive of people's taste and studies. For example, in Johnson's Universal Cyclopædia, the articles on Fish and Fisheries are written by a Mr. Gill, and the article on Cremation by a Mr. Sexton.

The Prince of Wales has accepted the Presidency of the English section, and Prince Frederick Charles that of the German section, of the Universal Exposition to be held at Paris in 1878.

It's gratifying to read in the Elizabeth Journal that one of the recent leaders of the "Bread or Work" movement has since been observed betting dollars liberally on a baseball match in that city.

A three-year-old boy in West Wardsboro, Vt., wandered into a field recently, where he met and played with two wild bears. The beasts did him no harm, though they had been killing sheep in the region.

Somebody gave a fruit luncheon at Newport. They had melons, pears, apples, plums, cherries, peaches, oranges, grapes and berries. That night every physician in the place was aroused from his bed.

The Crown Prince of Holland finds his own country dull, lives in Paris, and won't go home. The Dutch are not pleased with this, their flying Dutchman, and are especially annoyed that he doesn't marry.

Nothing will surprise a married man so much as to go home and see his wife limping around the room with her little toe bandaged, saying that she doesn't see why he should keep such an infernal edge on his razor.

A correspondent asks us what portion of the ear is called the "lobe." It is the portion which your parent used to firmly grasp when he led you gently out to gaze upon the handsome proportions of the neglected wood-pile.

The Woman's Journal asks, "Should women be self-supporting?" We don't know much about the merits of the question, but if they ever should be, man would be deprived of half the pleasure of a long walk home from spelling school.

"So," said a lady recently to an Aberdeen merchant, "your pretty daughter has married a rich husband." "Well," slowly replied the father, "I believe she has married a rich man, but I understand he is a very poor husband."

Mutual friends of Mr. Lathrop and Mr. Hawthorne have examined the former's book with special reference to the papers of the elder Hawthorne which his son objected to have used. They have assured him that these papers were not used.

A lovely female writes to the editor of the Hartford Times that "Down at Long Branch, the other night, it actually felt good to pull about three blankets over the still beautiful form of yours truly." And the ungallant editor actually printed the epistle.

An irreverent exchange attempts to show the antiquity of railroad speculation by reminding us that Jacob watered Laban's stock. In this connection allusions by facetious contemporaries to cow-pons and other rain-fications of the subject will not be tolerated.

An Englishman, regretting the present uselessness of Mount Vesuvius, suggests that the crater be converted into a receptacle for dead bodies, and proposes the formation of a company which will run funeral trains from different parts of Europe to the volcano.

The love of liberty, which is considered an American characteristic, finds full expression in the nomenclature of our towns. Missouri has twenty-one towns named Liberty, Ohio, twenty-four, Indiana, eighteen, Iowa, sixteen and Arkansas seven. This is very patriotic, but it bothers the postmasters.

A London woman with a child in her arms provoked her husband so much that he shied a knife at her. It killed the baby, entering two inches deep into the head. The jury acquitted the father by rendering a verdict of "Accidental death," and severely reprimanded the mother for having aggravated her husband.

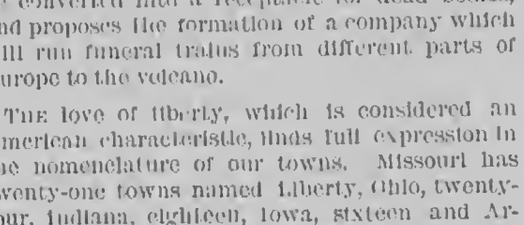
THE BEST ENGLISH DICTIONARY.



WEBSTER'S UNABRIDGED.

"Every farmer should give his sons two or three square rods of ground, well prepared, with the avails of which they may buy it. Every mechanic should put a receiving box in some conspicuous place in the house, to collect the stray pennies for the like purpose. Lay it upon your table by the side of the Bible—it is a better expounder than many which claim to be expounders. It is a great labor-saver—it has saved us time enough in one year's use to pay for itself; and that must be good property which will clear itself once a year."—*Mass. Life Boat.*

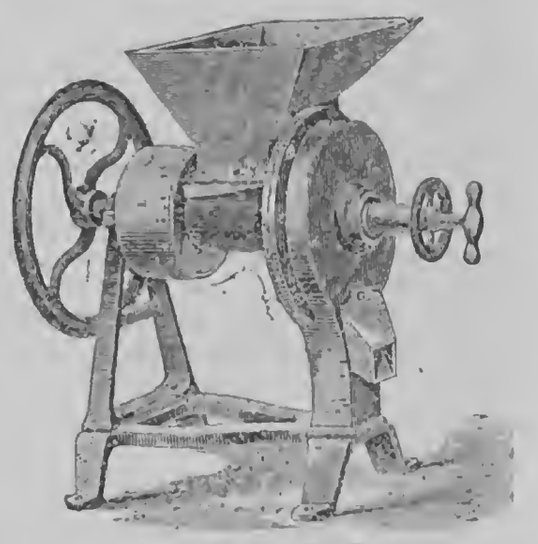
Manufacturers of Agricultural Implements,
Higganum, Conn.

Educational.

NEW YORK CITY, 128 Second Avenue.

WOMEN'S MEDICAL COLLEGE of the New York Infirmary. Session of 1876-77 begins Oct. 3. A thorough course of three years' instruction by Lectures, Clinics and Practical Work in Laboratory, Drug-room and different wards of the Infirmatory. For Catalogue, etc., address the Secretary of the College, MERCY N. BAKER, M. D.

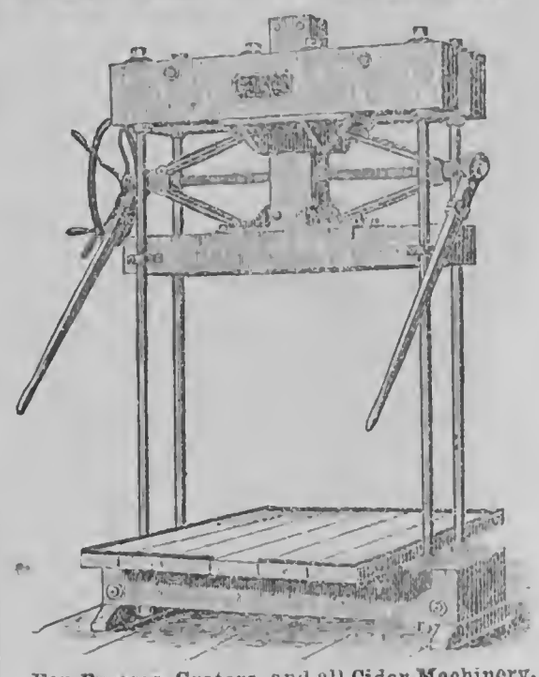


THE ABOVE CUT REPRESENTS
THE VICTORY CORN MILL.

This mill will grind corn and cob rapidly, coarse and fine; also, all other kinds of grain or seed. Capacity, **10 to 20 bushels per hour.** It is made entirely of iron, except the hopper. It is strong, durable, and not liable to get out of repair. It will grind more feed with less power than any other mill in the market. This is no humbug. We warrant it to do what we claim. Agents wanted everywhere. Price $10, delivered on cars at Springfield. Address
T. ROBERTS & CO., Springfield, Ohio.

☞ We also manufacture 1½ horse-power Vertical Portable Engines, suitable for running these mills, or for any other purpose for which power is required. Price $200.

CIDER PRESS.



For Presses, Graters, and all Cider Machinery, address
BOOMER & BOSCHERT PRESS CO.,
Syracuse, N. Y.

Pays all Losses by Fire and by Lightning.

This Company is confined by its Charter to Insure FARM PROPERTY and PRIVATE RESIDENCES *only*, and in over 23 years has never *insured* or *lost* a dollar except on this class of Property, and has never lost $5,000 by any *one* fire sweeping, or otherwise. Insure where there is an ABSOLUTE certainty of getting your money in case of loss.
JNO. C. COOPER, Pres't.
ISAAC MUNSON, Sec'y.

INSURANCE CLAIM ATTORNEYS.

WILLIAM BARNES (ex-Supt. of Ins. Dept. of N. Y.) and M. D. HANOVER, partners, as Counselors at Law, make *Insurance Litigation* a specialty. They will undertake collections of all kinds against Ins. Co's in any part of the country. Parties having such claims or holding life policies which they wish to surrender for cash or paid-up policies, can address (inclosing stamp)
BARNES & HANOVER, Tryon Row, N. Y.

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

D. F., Salem, Oregon.—My trouble is with tomatoes. My plants are all right. I had them in blossom the first of May and they have been in blossom ever since. But it was a long time after first blossoming before any tomatoes formed, and when they did, they grow to be only from ½ inch to 1 inch in diameter, then ripened. On examination, there were no seed in them. Was because they were not fertilized the reason they did not grow? Does the tomato need insects to fertilize it? Does the honey-bee visit the tomato blossom? If so, what for? Pollen or honey? I am a subscriber and constant reader of the RURAL NEW-YORKER.

It is quite probable that the climate of Oregon is not warm enough for the tomato. We cannot account for the failure in any other way, although you should know if the tomato succeeds with your neighbors. The tomato does not need insects for fertilization of its flower, as it may be grown under glass and where no insects visit the flowers. We never saw a honey-bee on tomato flowers, still it may do so.

Bugist.—The large green worms which feed on the tomatoes, are the same species so often found on the potato. They are the larvæ of the large five-spotted sphinx moth (*Sphinx quinquemaculata*).

J. S.—Connecticut seed leaf and Havana tobacco are varieties of the same species, and probably would become identical in a few years if both were cultivated together. There are local varieties of tobacco, the same as any other kind of plants, propagated from seed from year to year. Soil and climate have a great effect upon the growth and quality of tobacco.

Amateur Cheese-Maker.—The cause of the "floating curd" is unclean utensils. For instance, suppose yourself and assistant should not wash their hands clean after handling various articles used, such as the whey vats, etc., and then put them directly into the whey and curd, this might cause the difficulty named. Every utensil used, such as vats, tubs, dippers and the like, should be scalded and scrubbed with salt, after putting the cheese to press, each day, and if this is not done, "floating curd" will be very likely to follow.

Farmer Boy.—Cutworms are the larvæ or caterpillars of small moths, many of which fly into our houses at night and get their wings scorched in the lamp. There are, at least, a dozen different species which infest crops on the farm. These pests do not breed in the way you suppose, but the moths lay eggs and from these hatch the worms, and after these grow to full size, they change to what are called pupæ, and from these come the moths again. From this it will be seen that these insects pass through four different stages, each one quite distinct in itself.

Jack.—The long row of oval, flattish eggs which you found attached to a peach twig, are those of the oblong katy-did (*Platyphyllum concavum*, HARRIS). If you will look closely, many other specimens of the same can be found; but it needs sharp eyes.

Pigeon Fancier.—We do not know anything about the profits which might be obtained from raising "squabs;" but we do know that a flock of pigeons about a place is as great a nuisance as could well be invented. This is especially the case where one has cisterns, from which the water is used for stock or other purposes. A filter may take out the coarser parts of the filth, but the juice is still there, and it is no wonder that diseases are abundant where pigeons are kept and cistern water is used.

Plowboy.—Farmers generally prefer to plow sod ground intended for corn in the spring. If plowed in the fall, the sod does not become sufficiently well rotted to break to pieces in the spring, and the result is a very rough surface to work over, and the finest vegetable matter is not in position to come in contact with the roots, as it would be if plowed over in spring.

M. W., Poquonoc Bridge.—I have a Carnation and a double Fuchsia from spring slips. Owing to drought they have made but little growth. Will it pay to remove the roots to the house? ANS. The Fuchsia will often recover, though in the sun and dryness it lose every leaf. The Carnation we should not bother with.

(2) What shall I do with my bed of Geraniums when frost comes? Does it pay to try to save the whole plant for next season's flowering? ANS. For several reasons we prefer making cuttings of the plants to be saved. They will bloom almost as early—they are more shapely, take up less room and are far more satisfactory, both in foliage and flower, for the next summer's use. Scraggly, long, crooked-stems with scanty foliage are the results of carrying old plants over from year to year.

(3) Will the annual Dianthus continue to blossom through the winter if flowering plants be removed to a warm room? ANS. We can not say. They are really biennials—but the inflorescence is inferior the second summer and we prefer to sow the seeds every spring. Our impression is, that it will not pay you to remove them.

(4) When shall I take in my Gladioli bulbs? I planted out bulblets this spring and they have done well. Shall I take *in all* at the same time? ANS. Frosts will not harm them. You may leave them out until there is danger of the ground being frozen.

Mrs. L. Seaman, Ohio.—We give in the floricultural columns of this week, general directions as to Lilies, Hyacinths, etc., for both out and indoor culture. For minute directions we refer you to the advertisements of florists, any one of whom will forward you a catalogue, upon application, containing all the information you are likely to need.

The Hyacinth and Tulip must be planted this fall. Unless preserved in a freezing temperature, they will begin growth before spring, for which reason they are not in the market at that time. Tulips bloom in the following order, viz., Due Van Thol—Double, Parrot, Late.

Hyacinths that are bloomed in water can not be used in this way again—but if removed from the bottles as soon as the flowers fade and put in the ground, they will sometimes bloom quite well the next season.

Jno. C. Newbury, Texas.—I send you this morning a specimen of what is called here "Cockle Burr," and wish to know the scientific name of same.

ANS. *Xanthium strumarium*—variety, *echinatum*.

Real Estate.

10 YEARS' CREDIT. $2.50 TO $15 PER ACRE.

Improved farms, good buildings and fences, well watered, original growth timber, Oak and Hickory. Adapted for Grain, Grass, Clover, Fruit, Cotton, Tobacco, &c. Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Steamers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN

BETWEEN

NEW YORK AND CHICAGO,

via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York.

9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Wit and Humor.

AN EFFECT OF ASTONISHMENT.

He walked into the drug store, says the New Orleans Bulletin, and said, "Gimme a glass of that sody." "What sirup will you have?" asked the boy. "Seerup! I don't want seerup; I want sody!" The boy placed the glass under the faucet and turned on the soda water full head. As it struck the glass with a hissing noise the stranger said, "Gosh all Jerusalem! what's that?" and starting backward, fell over a stool, and as he tried to get up, he brushed against a perfumery stand, which caused a bottle to fall off and strike him on the back of the head. At the same time the boy, thinking something very serious had happened, dropped the glass on the marble counter, breaking it into 99 pieces. The unfortunate stranger, with his hand to the back of his head and his eyes protruding with fright, started for the street at a speed of 20 miles an hour and ran plump into the arms of a policeman, who collared him and, crushing him up against the wall of a house, said, "What's the matter?" "Mattor!" echoed the thoroughly affrighted stranger, "why, the drug store has exploded and I'm the only one saved!"

SPARKS AND SPLINTERS.

The mite that requires the most room when excited is Dynamite.

The most sublime illustration of confidence in your fellow-man is going into a restaurant and ordering hash.

Nearly all the post-offices in Texas are in charge of females. It works so well that the males now arrive and depart every hour in the day.

"Oh! my dear, how came you to be so wet?" inquired an affectionate mother of her son. "Why, ma, one of the boys said I daren't jump into the creek, and, I tell you, I ain't to be dared!"

"Some can bathe," says Mrs. Partington, "with perfect impurity in water as cold as Greenland's icy mountains and India's coral strands, but for my part I prefer to have the water a little torpid."

The sight of a hearse driven through one of the streets in Burlington, Vt., lately, with a half bushel of cucumbers on top was painfully suggestive. It is but seldom that so striking an example of cause and effect is seen.

The baby was doubled up with the cramps and yelling at the rate of a mile a minute, as the father and mother stood over the crib with the laudanum bottle between them. "No, Mariar," he said, gently but firmly, "you pour it out; that child is growing so like your mother that I can't trust myself."

First Boy.—Hello, Bob! Been in the Park? Any of the fair sex there?
Second Boy.—Yes, but none that I'd waste my time flirting with!

ROOFS.

Why not make your Roofs last a lifetime, and save the expense of a new roof every 10 or 15 years. *It can be done:* If you use Slate Paint, it will not only resist the effects of water and wind, but shield you from Fire.

OLD ROOFS.

Protect your Buildings by using Slate Paint, which neither *cracks* in winter nor *runs* in summer. *Old* shingle roofs can be painted looking *much* better, *and lasting longer* than *new* shingles without the paint, for *one-fourth* the cost of re-shingling. *On decayed shingles* it fills up the holes and pores, and gives a new *substantial* roof that lasts for years. *Curled* or *warped* shingles it brings to their places *and keeps them there.* This paint requires *no* heating, is applied with a brush, and very ornamental. It is *chocolate* color when first applied, but changes to a uniform slate color, and is in all intents and purposes *slate.*

ON TIN OR IRON ROOFS

the *red* color is the *best* paint in the world for durability. It has a heavy body, is easily applied, expands by heat, contracts by cold, dries slow and never *cracks* nor *scales.* One coat equals 4 of any other.

FIRE-PROOF NEW ROOFS.

Mills, foundries, factories and dwellings a *specialty.* Materials *complete for a new* steep or flat Roof of *Rubber* Roofing cost but about *half* the price of re-shingling. For Private houses, barns and buildings of *all* descriptions it is far superior to *any* other roofing in the world for convenience in laying, and combines the *ornamental* appearance, *durability* and *fire-proof* qualities of *tin*, at *one-third the cost.* **No Tar or Gravel Used.**

"How to *save* re-shingling—*stop* leaks effectually and cheaply in roofs of all kinds," a **100**-page book **free.** Write to-day: mention RURAL N.-Y.

BUILDING PAPER!

FOR SHEATHING, ROOFING, DEAFENING, CARPET LINING, AND PLASTERING

These are the best and most economical goods; impervious to dampness, heat and cold. Send for samples to B. E. HALE & CO., 56 and 58 Park Place, New York.

RURAL RATES REDUCED!

In announcing the reduction of the subscription price for THE RURAL NEW-YORKER, we can only say that it is done in a spirit of justice to all our subscribers, who are now paying reduced prices for everything. The old price for THE RURAL has been $2.65 per annum, and the

Present Reduced Rate is $2.50 per Annum,

and in clubs of ten or more, $2.

Great encouragement has been given us in our efforts to make the

BEST ILLUSTRATED

Agricultural and Family Weekly

ever published, and we make, in this Centenary Year, this substantial acknowledgment of it. It now costs us less to make the paper, and we propose to give our subscribers the benefit of every cent of the reduced cost.

ALL WE ASK

is that each subscriber and agent will continue his efforts to increase our list so that we can make a still further reduction.

The cheapest paper is not always the best, but

The Best Paper is Always the Cheapest!

Subscribers, show THE RURAL to your neighbors and ask them to subscribe. They will be benefited and you will be profited.

ALL AGENTS ATTENTION!!!

The Vineyard.

MINER'S SEEDLING GRAPES.

We have received from time to time, during last year and this, several samples of what appeared to be very promising new varieties of Grapes from the grounds of Mr. T. B. Miner of Linden, N. J. Believing it to be a matter of public interest, we at length concluded to examine these Grapes in the vineyard, and accordingly visited Linden on Wednesday, Sept. 13. Mr. Miner has about 40 varieties, which are the best of about 1,500, all raised from the Concord about ten years ago in Clinton, N. Y., where he then resided. Among these Grapes originally were many white varieties, sixteen of which were preserved and are now growing at Linden. The remainder of the forty sorts are black. All of these Grapes fruited at Clinton previous to the vines being removed to New Jersey, and consequently their productiveness may be considered as well-established.

Mr. Miner claims to have the best White Grapes of *native origin* in the United States, and if so, he may well ask to have the fact made known through the press — not that he may be pecuniarily benefited at present, as he has no vines for sale, but as a matter in which the whole country is more or less interested, especially as good White Grapes are very scarce, at least varieties that give promise of being adapted to general culture over a wide range of country. As a proof of this, we may look through our markets in vain for good, eatable White Grapes, although Red and Black sorts are abundant. An occasional lot of the Martha may be found, but these are exceedingly rare and command but little attention. No good White Grape is to be found in the New York City markets — that is, none which give full satisfaction to dealers and their customers, while the demand for such varieties is great and remains unsupplied, consequently we may repeat what we have frequently said before — that the person who produces a White Grape equal to the Concord in productiveness and early ripening, adapted like it to all sections of the country and of as good quality, will be a public benefactor. We do not name the Concord as a standard of great excellence in the quality of the fruit; but it is quite satisfactory to the masses, and besides, it has succeeded in localities and under conditions where hundreds of other sorts failed. Hence its widespread popularity in years past as well as at the present time.

It is certainly well to aim high in seeking anything, but we may sometimes oversight our mark and gather in no game as a result, as thousands have done in seeking extra fine-flavored Grapes borne on weak and naturally feeble vines. Perhaps the time may come when we shall have varieties combining all the good qualities now known to be distributed among the many, but until such are found we must accept of the best to be had, although constantly seeking for better.

Those who have been satisfied with a good, well-ripened Concord for a Black variety will certainly be pleased with the new White sorts raised from it by Mr. Miner, for the vines possess the hardy constitution, vigor and productiveness of their parent. In fact, after a very careful examination of the leaves and canes of these White sorts, we failed to find any characteristic which would distinguish them from the Concord. They have the same large, tough leaf, with the brownish pubescence underneath, and the bark of the canes the same dark-brownish or mahogany color.

WHITE GRAPE VICTORIA.

We shall not attempt to describe all of the new sorts raised by Mr. Miner, but merely a few which we consider most distinct and promising, although it may be added that the entire sixteen White sorts are worthy of cultivation, but in some instances the difference between them is not sufficient to justify their perpetuation as distinct varieties.

The present season has been the severest ever known in New Jersey, an almost uninterrupted drought having prevailed from the first of May until within the past few days, and its effect upon Grapes, as well as other fruits, is quite apparent in their small size and generally undeveloped condition, although not deficient in flavor.

WHITE VARIETIES.

Victoria.—Bunch quite large, moderately compact and somewhat clustered, as shown in the accompanying illustration. Berries large, globular. Skin thin, slightly tinged and specked with amber in the sun, but covered with a dense white bloom. Flesh tender, but with some tough pulp at center; of a sweet, rich and sprightly flavor. Ripens with Concord, or a few days earlier. It is a showy and handsome variety.

Augusta.—Bunch large and cluster-shouldered. Berries medium to large, globular, semi-transparent, with slight amber tinge. Skin moderately tough. Flesh not very tender, with some pulp at center, but with a sprightly, vinous flavor. A few days later than Concord. This variety, although not so good in quality as the first, would probably excel it as a market sort, on account of the large and handsome bunches.

Beatrice. — Bunch is large, shouldered, compact. Berries quite large, globular, of a greenish tinge; in fact, the color may be called a light grass green. Skin thin. Flesh tender and of a sweet but somewhat foxy flavor. Ripens before Concord.

Eugenie.—Bunch large and compact, shouldered. Berries medium, globular, pale, light amber in the sun, greenish white in the shade, covered with a dense white bloom. Skin firm, but not tough. Flesh tender, sweet and juicy, but some tough pulp at center. Ripens two weeks before Concord and may be considered a very early variety.

Ida.—Bunch medium, compact, with shoulder. Berries large, globular, greenish-white, with thin bloom. Flesh tender and of sprightly flavor, some little, tough pulp at center. Ripens with Concord.

Carlotta.—Similar to the last, but exceedingly

sweet and the pulp moderately tender. Ripens two weeks before the Concord.

AMANDA.—Also similar to the Ida; scarcely distinguishable; very sweet.

BLACK VARIETIES.

Of these Mr. MINER has quite a number which are fully equal to the Concord, and a few which we think are superior in quality. Among these we name *Lexington*—a handsome, large Grape, with very sweet and tender flesh. The *Madison* is also a fine sort, very sweet, but of sprightly flavor, ripening early.

But we were more interested in th White sorts than in the Blacks, as these give promise of filling a place which has long remained vacant. There is scarcely room for doubt as to the success of these sorts, as they are now growing in a soil and exposure which we should not consider very favorable to the development or success of anything but the most vigorous and hardy sorts.

"WINE-MAKING."

I ALLUDE to the article under the above head in your issue of the 16th inst., signed "T. B. MINER," not for the purpose of criticising it, for I think he is about right in his manner of making Wine from such grapes as he has mentioned, grown either in his or my latitude. The Delaware and Concord, I have no doubt, will contain more sugar grown further south, where they can safely remain on the vines till later in the season. The Clinton, I think, is about in its proper climate at about 42° North, though even here it is the best in the warmest and longest seasons. While agreeing in the main with Mr. M., I do not see the propriety of adding alcohol or spirits to the must, for the same thing is accomplished by the adding of cane sugar, a pint of which, at least, will be changed to alcohol in the process of fermentation.

The most perfect Wines, suiting the palates of the most perfect drinkers and judges, are doubtless made from perfectly ripened grapes without anything added. It is stated that the Germans, in the manufacture of the most choice Wines, dry the grapes for a while on straw to evaporate a portion of the water of the must.

Connoisseurs in Wine do not generally prefer Sweet Wines, and though discarding the least suspicion of acetic acid, they prefer it strongly tinctured with tartaric. With us, however, who have not generally made Wine a daily beverage, the majority prefer a taste of sugar—that is, do not prefer the smart test of tartaric acid. To make such Wine as the majority of men here prefer out of such grapes as we can get fully colored, I think, requires some water to reduce the excess of acid, and some sugar to sweeten and preserve it. There may be exceptions in favorable localities, like islands surrounded by large tracts of water, or the sides of mountains of considerable elevation, where by these means frost is kept off to a later period.

The best Wine I ever made, allowing my neighbors and myself to be the judges, was made Oct. 1, 1874, from what remained of my Clintons, Concords, Ives, Hartford, Catawba, Diana and Isabella Grapes (the last three never fully ripen here), making 11 gallons of must, to which I added 5½ gallons of water and 41 pounds of N. O. sugar, making in all 19½ gallons. The must was strained through a fine sieve into a 40-gallon cask, the water and sugar added at once; has been drawn from ever since, and never racked till lately, when there was hardly a gallon of refuse. After pressing out the must, I then added to the bagasse 6 gallons of water, and after a day or two pressed out 6¼ gallons and added 13½ pounds of N. O. sugar. This, I presume, would not have kept through the following summer. Don't know—didn't try it, but preferred it greatly to cider made of apple and worm juice.

Now, the only excuse I have for the foregoing is that I have often been benefited by the experience of others as reported in books and newspapers, and have the vanity to think that I may thus possibly benefit some one. My intention on the commencement of this article was to show, by quoting from their writings, the great differences of opinion and practice among the most eminent wine-makers of America, as to the propriety of adding under any circumstances any water or sugar to the must, also to give the analyses of some of our common grapes and to answer in my own way the long unanswered question, "Who shall decide when doctors disagree?" but I have already occupied the space intended, but will, if permitted, resume the subject.

S. B. PECK.

Muskegon, Mich.

NEW VARIETIES OF GRAPES.—Persons having new seedling grapes fruiting this season, for the first time, should carefully compare them with old sorts before offering the same for sale or propagating to any extent. If a new sort is no better than an old one what's the use of it, or adding another name to the list.

Farm Economy.

THE TUBE WELL AND ITS HISTORY.

THE essential difference between the immemorial dug and artesian well, and the modern tube well, is, that in the two former the earth removed from the hole is brought to the surface, while in the last it is forced aside by a pointed drill, driven down to the water-bearing strata. With a few rare exceptions, this drill consists of an appropriate length of wrought iron pipe, perforated at the bottom, and tipped with an adjustable, conical point, having a short stem fitting into the tube and a circular shoulder projecting slightly beyond it. When the perforated part has been submerged in the subterranean water a pump is attached to the upper end, and henceforth the tubular drill serves both as a curb to the well and a suction pipe to the pump.

It is now about a dozen years since this process of well-making was first pressed upon public attention. In this interval its marked superiority over former methods, in cheapness and facility of construction, as well as in the purity and abundance of the water supplied by it, has led to its rapid introduction, wherever the geological formation of the country would admit of its employment. To this success the ubiquitous canvassers for the multitudinous patents connected with it, have contributed, not a little, by indefatigable persistence in forcing on the public the use and merits of their respective devices, and necessarily also of the system that gave these birth and value. Thus it happens that at a moderate computation the United States possesses to-day at least 750,000 of these wells. At a low average these cost $50 apiece—an aggregate cost of $37,500,000. A recent decision in a patent suit recognizes the broad claim of N. W. GREEN as the inventor of this process of well-making; and straightway Mr. GREEN proposes not only to charge a royalty on all tube wells to be sunk during the unexpired term of his patent; but also to exact a penalty of $10 from the guileless owner of each well now in operation; or, in other words, to levy, for his own pocket, an arbitrary tax of 20 per cent. on $37,500,000 already legitimately invested in this species of property. In view of the phenomenal modesty of this demand a brief history of the invention covered by the patent on which it is based will be interesting to thousands likely to be pecuniarly affected by it.

The earliest account published in this country of the tube well-process of well-making occurs in an American reprint of "MAC KENZIE'S 5,000 Receipts," issued in Philadelphia in 1829 by JAS. KAY JR. & BRO. On page 388, a receipt "to raise water in all situations," tells us that the finest springs may be formed by forcing an iron rod into the ground, withdrawing it on reaching water, and inserting in the aperture a pipe for the passage of an abundant stream. Apart from the suggestive heading of this receipt, it is likely enough that flowing wells were chiefly, or maybe, exclusively contemplated by it; but the process of making a well, not the method of getting water out of it, is the question involved in GREEN'S patent; and the process described in his specification and covered by his claim is substantially identical with that set forth in MAC KENZIE'S antediluvian receipt-book. Of this household work three large editions had been scattered through the country, before the process, clearly advocated by it, first occurred to GREEN'S inventive genius in 1861.

During this year the rumored death of some of our soldiers, by drinking from poisoned wells in Virginia, caused much speculation among the troops about to visit the hostile Territory as to the best method of obtaining pure water. At this time GREEN, who had been educated partly at West Point, was the Colonel of a volunteer regiment quartered near his home in the village of Cortland, N. Y. During a discussion among the officers of the regiment on the hydraulic problem, the Colonel suggested that water might be obtained by inserting a tube into a hole made in the ground by an iron bar, and directed one of his Lieutenants named MUDGE, to make the experiment. The spot selected for this was on the margin of a neighboring stream. An iron bar was worked down a short distance by lifting and dropping it alternately. On its withdrawal the water rose to within a few feet of the brink of the hole into which a common tin boat pump was then inserted, and an attempt made to pump it dry. Contrary to general expectation this was found to be utterly impracticable, for the water of the adjacent stream swept through the thin barrier of intervening sand into the vacuum produced by the action of the pump.

This phenomenon illustrated very forcibly the prime cause of the inexhaustible stream obtainable from tube wells. In a dug well the pressure of the contained atmosphere on the riverlets filtering into it counterbalances that at their source, and the subterranean rills, with gravity alone as a motive force, trickle so slowly into the well that a brisk spell at the pump readily empties it. In a tube well, on the other hand, the earth hermetically packed round the suction-pipe excludes the air from the area close to its perforated extremity, where the action of the pump creates a vacuum into which the water is driven impetuously from the environing strata by the joint impulse of gravitation and atmospheric pressure at the fountain head. And this converging rush must continue while the pump is at work, until the vast tributary mass of subterranean water is exhausted.

By GREEN'S order MUDGE continued, for some time, his experiments with this unsatisfactory result. In every case a "drive rod" to make the hole was indispensable. To ascertain when this had reached water, repeated withdrawals were often necessary. The fall of loose earth, sand and pebbles from the sides of the empty hole added annoyance and delay to increased labor. Moreover in loose, friable formations there was always danger of the entire work collapsing whenever the rod was withdrawn. Into this rickety hole a sheet-iron cylinder was gingerly introduced to serve as a wall to the well, and a guard to an inner lead-pipe for the passage of the waters. The entire operation was more complicated, hazardous and uncertain, and hardly less expensive than the old mode, and not a single well sunk by MUDGE under GREEN'S direction turned out a permanent success.

In October 1861, GREEN'S regiment went south, but MUDGE returned home in the following January, and two months later was followed by GREEN who had been dismissed from the army for shooting the Major of his regiment. This deed brought upon him much public opprobrium and imbittered the three or four ensuing years of his life by the legal proceedings to which it gave rise. This worriment, however, was not without subsequent compensation. In it he has hitherto found a valid legal excuse for four years' negligence in asserting any claim to the invention of this process, and also for his marvellous ignorance of the public use others were, meanwhile, making of the discovery, a knowledge of which, without a protest, would have nullified his tardy claim to a patent.

After his return MUDGE drove a few wells on his own account, but speedily tired of the profitless occupation and sought more remunerative employment, whereas GREEN, all whose labors in the matter had hitherto been pleasantly vicarious, took no further interest in it now that a prosecution of it would have involved personal exertion and outlay. His legal embarrassments indeed left him little money and less heart for experimenting in a sordid occupation for which his education had naturally given him a gentlemanly contempt.

Meanwhile JAMES SUGGETT, an old well digger of the village, who had been hired by MUDGE as an assistant in his early experiments, continued to drive an occasional well whenever he could contrive to get an order for it. Such an order gladdened his heart in September 1862, yet it sorely puzzled his head how to fill it. The well-making business had of late been dull and unprofitable, and the old man's funds eked out by his credit could not purchase a sufficiency of tubing. In the previous May he had begun to substitute gas-pipe for sheet-iron as a well-curb, and in his present impecunious dilemma the ingenuity in makeshifts, born of galling poverty, urged an escape from the expense of lead pipe by the use of a single gas pipe to discharge the combined functions of the two tubes hitherto deemed essential to success. At the same time a fortunate difficulty in obtaining the loan of a "drive rod," suggested another tentative innovation. By forging to a point the end of the gas pipe which his limited means had purchased, he transformed it into a stout tubular drill, and thus, all unconscious of the ultimate results of his labor, insured the permanency of the process, and forged the instrument that was presently to open the way to his own rapid enrichment.

The well constructed under these difficulties was the first brilliant success, and SUGGETT'S makeshift expedients soon came to be regarded in the light of provident improvements reflecting no small credit on his inventive ingenuity. Thirteen months later, in September 1863, he filed an application for a patent covering his tubular drill, its point and perforations, and on the 29th of the following March this patent was granted. No sooner had SUGGETT obtained it than he hastened to sell territorial rights under it, before its value could be lessened by rival claims, or infringements.

In those restless days of flush pockets, and feverish speculation, tube well rights soon became as popular as investment, among those interested in domestic hydraulics, as oil well stock among the general public. Hence SUGGETT'S luck differed as much from that of ordinary patentees as his method of invention. From the first he found a ready sale for his rights and presently investors flocked to him with nearly as much eagerness as ordinary inventors have to exercise in searching for them. Ere the close of the year the piecemeal sale of his entire patent had lifted the lucky well-digger from indigence to affluence, and lodged him snugly among the capitalists of the village.

His financial success, quite as much as the obvious shortcomings of his crude but suggestive devices, soon flooded the country with auxiliary patents, covering a few needed and a host of superfluous improvements. Of these some substituted an adjustible point, of various shapes and materials, for SUGGETT'S clumsily forged makeshift. Others excluded sand from the suction pipe by screening its perforated end internally or externally, with wire-gauze or minutely perforated sheets of different metals. SUGGETT, with characteristic simplicity, had imperfectly accomplished this, during the process of driving only by economically packing the perforated end of the drill with rags to be fished out with a hook attached to the end of a long rod when water had been reached. The bulk of these patents, however, differed from each other merely in trifles so absurdly immaterial that imposition not improvement must have been the aim of their owners. Of the tube wells throughout the country fully four-fifths have already contributed in their cost to the price wrung from well-drivers for territorial rights under some one of these patents.

It was not in human nature that MUDGE should witness SUGGETT'S rapid enrichment without attempting to profit in like manner by the scheme which it was now exasperatingly evident he had himself abandoned prematurely. Accordingly in August 1865 he applied for a patent for MAC KENZIE'S process of well-making, and this was readily granted on the 24th of the following October. Six months' trial, however, demonstrated the fatal advantages of the pointed and perforated drill protected by SUGGETT'S patent, all claims to which he had frankly repudiated in his own application. Finding, however, that his patent, in its present form, was useless, and still worse, unsalable, he surrendered it on the 5th of March 1866 and boldly sought an amended reissue covering a perforated pipe and point in addition to the process claimed in his surrendered patent.

By this time SUGGETT'S success and the widespread use of the system that had sprung from it, had roused GREEN to a lively sense of the vast possibilities of fortune still latent in the novel enterprise. MUDGE'S early experiments ordered by him were constructively his; and MUDGE'S late patent gratuitously proved that a process of making a hole in the ground was patentable. SUGGETT'S application had embraced a claim for this which the underlings of the patent office had so unfeelingly ridiculed that his agent—Hon. R. H. DUELL, Congressman from Onondaga Co., in those days and Commissioner of Patents in these—prudently docked the instrument of this pretention. Yet GREEN might well have hesitated about contesting MUDGE'S conceded claims had not the latter voluntarily resigned the vantage-ground of possession. On this missmove his alert rival promptly filed, twelve days later, an application for a patent for the process of sinking wells by forcing down a rod into the water under the ground, then withdrawing it, and inserting in its place a tube, perforated but not closed at the bottom, for the purpose of extracting the water. This process was identically the same covered by MUDGE'S surrendered patent, and substantially the same described in MAC KENZIE'S ancient repertory. In view of the reciprocal infringements of the rival claims of SUGGETT, MUDGE and GREEN, the Patent Office, on the 31st of March 1866, declared an interference between the three. After three diverse decisions, as many successive appeals, and 22 months' litigation, the U. S. Court for the District of Columbia finally decided that SUGGETT'S patent and GREEN'S claim were equally valid, and that the luckless MUDGE had no rights which the Patent Office was bound to recognize.

On the plea that his patent covered every form of the new process, GREEN at once set about exacting a royalty on all tube wells. In this he was grievously embarrassed by the hostility of the well-owners, and presently obdurately checked by the joint action of the chief manufacturers of iron pumps. Imprudently enough he had incurred the vigorous opposition of the majority of these by invidiously insisting, in all his dealings, on the exclusive use of the pumps of a single favored manufacturer. To protect their trade and customers, therefore, the rival houses were forced into a combination to test the validity of the oppressive patent. Although judgment went against them in the recent trial there is little doubt but that in view of the varied interests involved, the case will yet be appealed to the U. S. Supreme Court for final settlement. Whatever the decision there, equity certainly does not require that the public should be heavily taxed to reward the individual talent, outlay or labor, bestowed on the invention of the tube well.

KEME.

AGRICULTURE AT CORNELL UNIVERSITY.

PROF. ROBERTS communicates the following to the Ithican in regard to prizes offered by the Cornell University, for proficiency in agriculture.

In order to specially foster the study of agriculture in the university which he founded, Mr. Cornell offered several prizes for excellence of attainment in the study, and, among others, some for the management of a small garden which was assigned to each student desiring to compete. A number of students contested for this prize, and those who entered into the work with enthusiasm and graduated in their course of study, are now occupying positions of honor and trust in the direct line of agriculture.

Mr. John McGraw, another trustee of the University, has recently provided in a generous manner for the continuation of these prizes. He offers to give a first prize of $200 to any two or more students in the full course in agriculture, who shall most successfully manage a little farm of two acres, according to a certain prescribed plan; and a second and third prize of $165 and $135 respectively for the second best results in the same line. Each of these miniature farms, of which there will be at present only three, will be subdivided into five smaller plots of equal size, and is to be properly manured, and worked by a rotation of grass, wheat, oats, corn and garden vegetables, so that the land will always be kept in good condition.

The students competing for these prizes will be charged a reasonable rental for the use of the land, and will be furnished by the University with the necessary help from teams and implements at a moderate charge per hour. They will be required to perform all the manual labor themselves, to keep an accurate account of all their expenses and returns, and a careful diary of their work, and at the same time to perform their regular University duties in a satisfactory manner. The first award of these prizes will be made about Dec. 1, 1877.

Dairy Husbandry.

CHEESE DAIRYING IN MAINE.

IT is only a few years ago that so little of dairying was known in Maine that nearly all the cheese required for consumption was brought from other States. Now Maine has quite a number of cheese factories, and dairying is being pushed forward with great rapidity. The soil and climate of Maine are eminently adapted to dairying, and it is a matter of surprise to us that dairy husbandry had not become planted in the State many years ago. In some parts of the State the production of hay and potatoes has been the leading business. These, and other crops, being sent to the markets, left the lands, for the most part, unsupplied with manures, and, as a consequence, farms were becoming less and less productive from year to year. The introduction of dairy husbandry, therefore, will be a great advantage in renovating the land, to say nothing of the increased profit arising from the dairy above that from the old method of farming.

In the Report of the Maine Board of Agriculture, for 1875-6, we find several papers in relation to the dairies of Maine, which are of considerable interest. Mr. GEO. A. BRACKET tabulates the statistics of a number of cheese factories, from which it appears that the whole number of factories in the State, in 1874, was 36. The average cost of factory (both building and apparatus) is $1,911. The longest time any factory operated that year was 166 days, or five and one-half months. The largest number of cows reported as furnishing milk to any one factory was 350, and the average to each factory 144. The whole amount of cheese made in Maine factories, during 1874, was 1,028,107 pounds, and the average number of pounds of milk required to make a pound of cured cheese was a fraction less than ten.

VALUE OF WHEY.

Whey is estimated to be worth two cents per gallon, and Mr. BRACKET'S remarks on this question are as follows: "Experiments made last summer, in feeding it to hogs, place its value at little, if any, less than sour skimmed milk. Hogs fed on it wholly for weeks were as thrifty and grew as well as those fed on milk. Fed with a small amount of corn meal, it is undoubtedly of much more value in making pork than was formerly supposed—in fact, when factories first began to operate, it was allowed to run to waste."

We are not inclined to put much dependence upon experiments that "place the value of whey at little, if any, less than sour skimmed milk" for feeding hogs. Indeed, if this could be so, the whey used in the experiment must have been exceedingly rich, while the sour milk must have been very poor. Some skimmed milk contains all the elements of milk, except the butter; while in whey, we have but a very small percentage of nitrogenous matter, or flesh-forming substance, its chief constituent being milk sugar.

The following tables will show the difference between the composition of whey and skimmed milk:

In a sample of whole or new milk which was taken to make cheese, the following was its composition:

Water	87.00
Butter	3.99
Caseine	3.44
Milk sugar, extractive matter, etc	4.81
Mineral matter (ash)	.76
	100.00

Now the whey, resulting from the above milk after its manufacture into cheese, was as follows:

Water	92.80
Butter	.59
Albuminous compounds	.91
Milk sugar, lactic acid, etc	5.04
Mineral matter (ash)	.66
	100.00

In a sample of new milk which was set aside (the morning's milk standing 24 hours and the evening's milk 36 hours before skimming), and, after the cream was removed, the following was its composition:

Water	89.00
Butter	1.94
Caseine	3.00
Milk sugar and extractive matters	5.24
Mineral matter (ash)	.78
	100.00

It must be evident, to any one comparing these tables, that the skimmed milk is much more valuable for feeding purposes than the whey. Whey contains so little nitrogenous matter that it ought never to be used as a sole feed for hogs, but when wheaten bran, shorts or ground grain is mingled with it, whey can be utilized for feeding to good advantage. It is true, hogs will live on whey alone, but the pork made from it is watery, poor, and, in our opinion, not a fit or healthful article of food. Mr. BRACKET says cheese makers in Maine get about $75 per month and are obtained, for the most part, from other States. He suggests that young men from the State should be taught cheese making at the factories, and thus the money paid for cheese making be kept in the State.

In some parts of Maine, the Jersey cow and Jersey grades are used for cheese dairying and, according to J. R. NELSON of Winthrop, it requires only 8 lbs. 7 oz. of Jersey milk, on the average, to make one pound of cheese. The factory where this average was made is in Winthrop, and was run only 160 days. The cows delivering milk, he says, will average more than half-blood Jerseys. He advocates Jersey cows for cheese dairying, on the ground that it takes less of their milk to make a pound of cheese, while the cheese is richer than that made from the milk of other breeds, and ought to be, on this account, worth more money. In addition to this, the spring and fall butter making from Jersey milk gives better results, as to quantity and price, than other milk. The cheese at present made in Maine, is retained in the State for home consumption.

MEADOWS AGAIN—A WINTER MULCH.

THE winter last past, 1875-6, was very severe upon meadow lands, and much of the drainage, in many instances, could have been avoided by proper attention and treatment of the lands after harvest and during the fall. During a considerable portion of the winter, it will be remembered, the earth was left bare of snow and exposed to intense cold. The ground froze to a great depth, and the alternate freezing and thawing killed the roots of grasses to a greater extent than usual. Whatever inconvenience and discomfort there may be in deep and long-continued snows in our climate, they serve as a protection or winter mulch for our grass lands. Every one must have observed that where the snow lies deep and long, there the grass springs up thick and rank. The old adage that "snow is the poor man's manure," is not without foundation, in fact. It costs nothing, and is very valuable in its prevention of frosts. Nature teaches important lessons, and we may learn from the action of snows that a winter mulch is not without profit.

During spring, and up to the present time, we have made personal examination of many meadows in Herkimer and other counties of New York, lying in the dairy belt, and in not a single instance have we found the grass destroyed on meadows where the lands were not allowed to be pastured after the hay harvest and where a good coat of grass remained at the commencement of winter. The protection which this covering gives to the roots and tender shoots during a season of little snow, and where the ground is laid open to the blasts of winter, will be almost equal, in results, to a coating of manure applied in spring to meadows that have been fed down close in fall, while the latter is far more expensive.

Manures, spread in fall over the lands, operate beneficially in this way. They are a protection against the severity of frosts, while the fertilizing elements, at the same time, give greater vigor to the plants late in the season, thus bracing them for the rigors of winter—acting much the same as a well-filled stomach of nutritious food braces up the human system for endurance.

The next three months is the season for preparing meadows for a bountiful yield in next year's crop. Let them have a winter mulch either of grass or manures, and they will respond to such treatment at the next harvest.

ADDITIONAL POINTS IN DERBY CHEESE MAKING.

IN a recent letter from an English correspondent, we have additional particulars in regard to the manufacture of Derbyshire cheese. They are as follows: "The rennet is put in the milk, the temperature of which is at 80° to 82° Fahr. After the coagulation is perfected, the mass is broken fine at the first and until it is reduced to almost a pulp. Then it is left at rest for half an hour, when the whey is drawn. The curd is now heaped up in the tub and this process is continued at intervals until sufficiently solid. It is then broken to a moderate degree of fineness, by hand, and put in the cheese hoop and pressed and turned, when the cheese is well-rubbed with salt. The next night turn and use another cloth, and continue salting for five days, once a day. It is then taken from the press and ironed on thin paper, when the cheese is ready for the cheese room."

In the description given in the RURAL of Aug. 19th, the statement is made that Derby cheese, as made by Mr. JOSEPH HARRISON of Derbyshire, commands "top prices"—on a par with English cheddar. It does, indeed, bring high prices, but we are informed by Mr. OLIVER, who has given us many of the facts concerning its manufacture, that the prices received are not equal to those obtained for the *best cheddar*.

The object in making the Derby process known to our dairymen is not for the purpose of introducing this system of cheese making on this side—for it is doubtless inferior to the cheddar process—but rather to show by what curious and diverse processes cheese of fine quality could be manufactured. From this point of view, the subject must be of interest to dairymen, and, from some of the parts of the process perhaps useful lessons may be learned in regard to the condition and texture of curds for making good cheese. We refer our readers again to the article in the RURAL of Aug. 19th, believing it will prove of interest to those who are looking for curious methods in cheese making.

CHEDDAR CHEESE.

FROM market reports it appears there is cheese making 8 or 9c. ₱ lb. more than American, and this being a difference of from $5 to $7.50 ₱ cwt., will cause a discouragement to many farmers making cheese on this side of the Atlantic. It is useless to try to explain away the fact that the English is really better, and there is no better proof than for a farmer to go to RICHARDSON'S, or some other house in New York City importing English cheese, and eating some; at the same time, if not a lectotaller, trying some English ale with the bread and cheese.

It is not want of knowledge in making cheese; it is not that the milk is richer; it is the peculiar flavor given the best cheese by the old-established natural grasses in the dairy fields in England. Mr. OLIVER knows very well that neither himself nor any of the most renowned and first-class cheese makers could make cheese of better quality than American if the cows were grazed on any pastures which are plowed and reseeded.

I assure American cheese makers there is great misunderstanding on this subject. Men have very little to do with making the noted and famous cheese called double Gloucester, and, perhaps, most of the other high-priced cheese is made and managed the same by women and, in many and most instances, by young girls, and, in all cases, by unmarried young women, under the general superintendence of the farmer's wife. But it is not intended to set these females up as superior to men, excepting that they make an article without any fuss, going on in the old-fashioned way, without any *cooking*, and doing all so plain that a child could understand every thing belonging to the operation in a short time. It is, of course, necessary to do all in the usual systematic way, and the dairy-maid must take pride in her work; but all effort, pride and art would be useless without the right grass.

HERDS AFFECTED BY IMPURE WATER.

DURING the drought that has been prevailing, we hear of trouble in some herds on account of the condition of water where the cows slake their thirst. Water, at such times, not unfrequently becomes charged with vegetable matter to such an extent as to be unhealthy. The refuse from cheese factories, when turned into streams where cows drink, poisons, to a greater or less degree, the water. When the stream is large and rapid, the ill effects of such water may not be so apparent; but in times of drouth and low water, dysentery and other diseases not unfrequently occur. Dr. BELLEWS mentions a case at the Nottingham Assizes, in July, 1836, at which it was proved that dysentery in an aggravated form was caused in cattle by the use of water with putrescent vegetable matter, produced by the refuse of a starch factory. All the cows, calves and horses which drank of this water became sick, and in eight years the plaintiff lost twenty-four cows and nine calves, all of dysentery. It was also shown that the mortality was in proportion to the quantity of starch made at different times, and that when water containing the putrescent matter was not allowed to pass into the brook the mortality ceased.

We have abundant evidence to show that impure water has seriously affected the health of stock and poisoned the milk of cows partaking of it; and the first duty of dairymen is to provide good water for his animals, for not only the healthfulness of the beasts, but that of their milk will depend upon his action in this regard.

The Horseman.

SELECTING HORSES BY THEIR COLOR.

MOST persons have their choice in regard to the color of horses, but we presume few of our readers ever thought that it had anything to do with speed or strength. A correspondent of the English Farmer, however seems to think that there is no doubt that fashion with regard to color has been greatly influenced by the special qualities usually found in combination with special tints or shades; though it by no means follows that a colt merrily exhibits the same colored hide as its immediate parents. A writer at the close of the last century stated very broadly that not only among the Turkish horses were many of pure white color, but that in Persia there were studs of them, several thousands in number; while it is a well-known fact that until after the death of Prince Albert, the Queen's state carriage was drawn by eight cream-colored horses, of whom a succession is still kept up at Hampton Court. Strange to say, however, while the cream-colored horse is noted for powers of endurance, the gray is held to be deficient therein; and while black horses are rarely first-rate in point of speed, the browns, the chestnuts, and the bays—the last more especially—are noted for their turf victories at Epsom and Doncaster.

An author of good credit, treating of the mixture of breeds in cattle, and especially in horses, advises, with a good deal of reason, to take care of the good qualities of the horse and of the mare. He says that an ill-bred horse may beget a colt that may have a fair color and shape, appearing beautiful; he may be also strong and vigorous, but of a vicious disposition which may render him incapable of ever being brought to rule, without half destroying him. As to the choice of a stallion, a person of great skill says, that the dapple-bay, the white-bay, and the dapple-gray are to be preferred; but does allow of a horse of a pure black, provided he has a white star, and a white foot; but in the judgment of others he should be all of one color. We find, in many cases, that horses of a bright bay color, with a black mane and tail, are good as well as beautiful, and these have commonly the tips of their ears and the extreme parts of their legs black; it is also common for a dapple-gray to have a white mane and tail, with the former mentioned extremities white, such as the tips of the ears and the extreme parts of the legs; but for other colored horses, except the dun, we seldom find their manes and tails of a color different from that of the body, but in a dun horse, the long hair in the mane and tail is commonly black, and for the most part there is a black list down the back, which is not a little remarkable, as it is not observed in any other creature except the ass or mule that I know of.

In a horse, indeed, it is only a plain straight line, but in the ass there is also a cross stroke of black over the shoulders, so that if the skin were to be opened and spread, the black would exactly represent the figure of the cross, as it is represented in painting or carving for a crucifix. Some pretend to tell us as to the cross upon an ass's skin, that asses were not thus marked before the Christian era, and that none are now without the sign; but upon what good authority they assert this, I know not. Some are of opinion that the black list down the back is a token of strength, because the ass that is marked with it is accounted the strongest creature in the world among animals, according to the size. And for this reason asses are used for carrying heavy and drawing heavy loads. If this list, then, be a mark of strength in an ass, we may well suppose it is not less so in a horse; and likewise we may judge it is also a sign of strength in the mule, and is produced by couplings between the horse and the ass; we may well suppose that this list, generally speaking, comes from the ass.

The Centennial.

AVERILL CHEMICAL PAINT.

PHILADELPAIA, Sept. 22d, 1876.

NOTHING, perhaps, impresses an American so agreeably as the numerous and tasteful structures that dot the grounds in all directions; lesser jewels, to be sure, but serving as admirable foils to the principal gems of the crown. It is all the more soothing to one's pride when one reflects that most of the buildings to which I allude owe their existence to liberal private onterprise.

It is a fashionable American slur to intimate that our citizens worship but the one god, Commerce, and that his prophet has but one eye, viz., an eye to the main chance. Like all epigramatic and sweeping generalizations, they contain more unalloyed misrepresentation to the square inch than any other kind of assertion. As near as I can judge from appearances, exhibitors have, in nearly every instance, devoted more money in contributing to the general picturesqueness of the Fair than could, in any event, have justly been required of them. To be sure, an attractive case sets off wares to advantage; but it is not by any means to be expected that a firm will expend thousands for a temporary structure, when that sum, going through the ordinary channels of trade, would yield direct and tangible results out of all proportion to what could be derived from the advantages of a Centennial exhibit; therefore, we must ascribe the outlay to patriotic motives. Granting this, it surely throws a glamor over our alleged greed of gain, than which nothing could more decently cloak our (supposed) mercantile avariciousness.

The immediate cause of this brief homily is a pleasing little pavillion, painted in bright, cheering colors, facing Fountain avenue, just west of Machinery Hall. Description is vapid by contrast with illustration, and I have accordingly secured an electrotype of the Averill Chemical Paint Company's pavillion, for which I am indebted to Mr. TAYLOR, the genial agent in charge of the firm's interests in Philadelphia.

The house is a square cottage, shapely, and graced with a spacious verandah. Tasteful beds of flowers lure visitors up to the portal facing Fountain Avenue. As one enters, there greets the eye pigments of all the colors of the rainbow, tastefully displayed on circular platforms. Here is shown the crude material from which the Averill Chemical Paint is made, and the inquisitive visitor has no difficulty in tracing its various stages up to and including the finished product. The practical application is about him on all hands, the house itself being, of course, decorated in various hues. Although it would seem quite obvious that those who made paint should use it when occasion required, yet it is not unusual for the vacant-minded visitor to ask: "Is this house painted with your paint?" after having heard an eloquent argument in support of its merits. After a question or two of this nature, Mr. TAYLOR retires to his inner office, and invoking a huge lump of the article, asks, *sotto voce*, "And is it for this, O! valuable pigment, that we have expended something like $7,500? Does a careless fate allow such stupidity to stalk abroad in the light of this Centennial day unrebuked,—and a handy railroad-crossing so near, too?"

However, everybody is not an undeveloped protoplasm, and the Averill display is doing a good service in demonstrating its capabilities to thousands who previously had no adequate idea of its many superior qualities.

A novel and peculiar feature exhibited by Messrs. SEELY & STEVENS is their Pellucidite, or Architectural Wood Finish, for finishing hard wood work. The fact that it is the custom to finish the interior of buildings with hard wood, makes it highly important that a material possessing elements of durability and beauty should be provided to apply to the surface of the wood. Great difficulty has been experienced in securing a suitable material for this purpose. In many instances the wood is left without a coating, rather than use the various articles usually employed for this purpose, as, in most cases, they perish when brought in contact with water, and the action of the atmosphere, thus destroying the grain and beauty of the wood.

Linseed oil seems to be entirely unsuitable, as it imparts to the wood a greasy appearance and darkens and hides the grain. It is also common to use shellac. This varnish is very objectionable, as it blackens and destroys the grain and has no elements of durability.

The legitimate object of coating wood is not only to preserve it from decay, but to hold its natural color and bring out the grain in distinct relief.

The Pellucidito is designed expressly as a finish or coating for hard wood, and is now being used with the most satisfactory results by builders and architects. The samples of work seen by your correspondent seem, in all respects, to bear out the claims of the manufacturers. Altogether the display is one that may well attract the admiring attention of the crowds who daily throng the handsome little edifice. YOUNG RURAL.

The Poultry Yard.

KEEPING POULTRY.—No. 8.

AFTER the fowls are domiciled, comes the new and, what ought to be, pleasant work of caring for them. Unless a person takes pleasure in making his stock comfortable, attending to all their wants, he should not keep them. If they are confined to house and run, they must be supplied with every requisite inside the inclosure. A box of broken oyster shells must be always acceptable. I have often noticed fowls, when confined during the fore part of the day and let out towards evening, run first for the broken shells lying on the road, and afterwards for green and other dainties.

A box of fine gravel to each run is required as well as oyster shells. It helps to grind up the shell for lime to make egg-shell, besides helps to digest its food. No fowl remains long in health without it, as its digestion would not be in its natural working order.

Another thing, the dust-box must be always at hand and dry, as parasites will always overrun any house and fowls that are not thoroughly cleansed. Many a fancier calms his conscience on this matter by not making a good use of his eyes, there being a greater number of these pests than most people have any idea of, and a wide field awaits the patient observer to discover and bring them out. The several varieties differ very much in habit and appearance. Some live on the feathers, others on the body, others on chick's heads, while some keep in the perches, nests and woodwork of house. In the RURAL of August 19th, will be found an article on "Vermin among Poultry," treating of the way to destroy them.

When confined, their food must be more varied than that of fowls running at large. Ground beef scraps are very good, they contain many small patches of bone. They will keep through the hottest weather, if they are kept dry. Poultry are very fond of this kind of food, and I prefer it to pork scraps. When this is not furnished, give them some ground bone at times, or, what it better, hang up a small copper on the wall, a little distance from the floor, but they may take what they like.

Always keep on hand sulphur, disinfectant powder or carbolate of lime, and such things as will be likely to be used at any time, so that when occasion requires, or you have a little time to spare, you may not have to wait for them.

The test that calls for the use of disinfectants, more ventilation, or cleansing, is to go into the house any night, after it is closed up, and if you observe an offensive odor, you may depend that something more is requisite to keep them in healthy condition. It is good to fumigate once or twice a month during winter. Now and then dust a little carbolate of lime about the walls and floor of house while birds are penned in.

In wet weather see that your fowls do not get too much drenched. At this season we are subject to sudden rain storms. The young stock are not fully feathered. Most of the old ones moulting, and they are very likely to suffer severely. The water, running through their imperfect feathering to their bodies, often makes short work with them. If a cold rain continues till night, do not let them roost on the trees that night (if they are in the habit of doing so), but drive them into the house, even if it be at the expense of getting a little wet yourself.

Most fowls know enough to go in themselves; but there is, and always will be, of fowls (as of other two-legged creatures), some so simple as not to know how to take care of themselves. H. HALES.

POULTRY AT NEW JERSEY STATE FAIR.

THE great advancement made in the poultry department of the New Jersey State Agricultural Society's Fair, at Waverly, is very encouraging. Year after year scarcely a good pen of fowls ever graced its grounds. The improvement this year is no doubt partly due to the encouraging list of premiums offered for many more varieties than usual, and it has not failed to bring them out.

The Society should now go a step further and let some judge of such stock see what quality of birds is offered at its gates, and to keep out so much of the mongrel stuff that still finds its way in, for the sake of getting an exhibitor's *free ticket*, or to make up a large variety, in order to win the State premiums for greatest number of kinds. Also, have the judges appointed some time before the Fair, so that they may be on hand and do their work before the names of exhibitors are placed on the coops.

Some very good birds are exhibited. Light Brahmas are in full force, and the young ones number some good birds. Some good Partridge Cochin fowls and chicks, while the other Asiatics are slimly represented. But there are on exhibition some very good Hamburgs, Gold and Silver, lots of White and Brown Leghorn chickens, also fair Game Bantams, also a few very fine White-Booted Bantams, Pearl Guineas, Frizzles and Japan Silkies.

Swans, Bronze Turkeys, Egyptian Geese, Aylsbury, Rouen, Muscovy and Pekin ducks, in good numbers. The latter were not on premium catalogue, and were never shown at Waverly before, and the force in which they are presented, must be a surprise to many.

The Pigeons were a long way ahead of the usual show. One lot of fowls, the owner said, was from imported Brown Leghorn's eggs, were finely speckled grayish brown, and their combs form a sort of crown, lying over all around their heads, cocks as well, giving them a singular appearance. H. H.

GET the chicken roosts ready for cold weather as it is near at hand. The rooms should not be air-tight, but ventilated at top, closed at bottom.

Around the Republic.

DASHES AT FLORIDA.

OLIVER TAYLOR, an experienced pomologist, formerly of London Co., Va., has been wandering over Florida for the past seven years, and like NOAH'S dove, finding no resting-place, is now seeking a home a little further north. He has given a very graphic account of his experience and ramblings in a series of letters written to the Prairie Farmer, which, to say the least, must have been very interesting to those who may have contemplated finding a home in the "Land of Flowers," and we will add, they have been especially so to us from our former acquaintance with the writer and our knowing him to be a man well qualified to judge of the adaptation of a soil or climate to fruit culture or the ordinary branches of agriculture. The closing letter of the series gives the pith of the whole and clearly sets forth Mr. TAYLOR'S experience and conclusions about Florida, consequently we copy it for the benefit of those who may desire to know what a Northern pomologist thinks about the State mentioned:

"Everywhere that I have been in Florida I find the roots of the peach trees subject to numbers of knots in them, and the slower the trees grow, generally the more knots on the roots. Other trees are affected the same way, and even vegetables and weeds have knotty roots. I think that Berckmau, in the Farmer and Gardener a few years ago, attributed the knots to a clay soil, but my observations do not confirm that idea, as the soil at Apalachicola is devoid of clay, yet the trees were quite as much subject to knotty roots there as here, where there is clay.

"I am convinced too great heat causes it, as it does not occur in Virginia, even in clay soils. There is a large belt of pine barren land belting the Gulf of Mexico off from the alluvial deposits of large rivers, some sixty to eighty miles wide, where the peach appears to thrive well when first planted; but soon the great need of potash in the soil causes first the rich, high-quality, large varieties to fail, then other poorer varieties, after making two or three good crops cease to do more; and their charitable owners excuse them by saying the worms got at them and killed them. This fact only can explain the reason why good peaches are so few in Pensacola every year.

"This belt of pine barren land widens as it reaches the peninsula, until it covers nearly all of South Florida.

"To find a soil to produce peaches, grapes and figs to perfection, that pay culture for a number of years, one will have to go above the pine barren land, where lime in the soil is abundant and the oak trees, with hickory and walnut, show that potash is not lacking. The numberless efforts and failures to make peach-growing profitable in this poor belt will prove the truth of what I assert.

"If one wishes to get rid of consumption, by all means try the pine woods of a warm Florida coast on the Gulf side, and if he wants to cure dyspepsia, let him go up the St. John's River with a light purse, and the simple fare of that section will most likely bring his digestion to terms; but if you wish to have neuralgia, just stay five years in one place and work moderately all the time, and it will be very apt to show that life has need of variety to keep the current clear and active. I have found very few white women in the State five years, clear of chronic disease, but say they have had neuralgia. Doubtless the universal use of tobacco does much to tire out the nerves, as women use it quite as freely as men.

"To end, I would add, stranger reader, whoever thou art, don't settle on pine barren land in Florida in the hope that it will grow richer, and don't get on the river bottom land in a warm climate and expect to eat meat and not have a fever; but if you wish to find a home where the cold winters of the North may not oppress you, I give you my experience of seven years' anxious search in this State, and advise you to try Georgia, Alabama and Mississippi above the pine barren, and put up with a short winter for the sake of the abundant grain and fruits there produced. Don't go to any part of Florida and suppose you will find fruits abundant half the year, or vegetables cheap, in a healthy location."

Industrial Societies.

NEW JERSEY STATE AG. SOCIETY.

EIGHTEENTH ANNUAL FAIR.

WAVERLY, N. J. Sept. 19, 1876.

THE same old story—too much Centennial this year for successful Exhibitions in this part of the country. New Jersey is making rapid strides in Agriculture as may be observed by a comparison of the Annual Fairs of this society. The excellent display of fruit and vegetables will attest the deep interest taken in their cultivation by the citizens of this State. Possessing some of the richest (and some of the poorest) land in the country, the farmers are beginning to wake up to the importance of good cultivation, which revival is largely due to the efforts of this society. In attendance, this year's meeting will hardly be a success; but in Exhibits it will compare favorably with those of previous years.

Lying contiguous to Newark which is a large manufacturing town, and not very distant from either New York or Philadelphia, the Waverly Fairs offer their principal attraction in horse racing. That this is to be deprecated the RURAL has always maintained. In defence of it however, one of the officers says that the demand of the neighboring large cities for trotting stock makes its breeding in the locality a profitable necessity and an important feature of the Agricultural interests of this State. This would be a good defence if defence were possible; but it seems to me that the feature is indefensible.

Another bad feature I noticed was the numerous side shows upon the grounds within a few feet of the space allotted to the display of implements. Now it strikes me that when a Society of this character depends for success upon the paltry rents received from the show of the Albino children, the Wonderful Magician, the Three-Legged Cow and kindred shows, it would be a little more straight-forward to go into the Circus business at once and so advertise to the public. Why not give the three card monte men and the thimble-riggers a chance on the grounds? They would doubtless attract quite a crowd.

The display of implements was quite large for Waverly. Among the machines were the Warrior mower and Randall Harrow of the Warrior Mower Co., Little Falls, N. Y. The new Brown Reaper of Adriance Platt & Co. The Screw Mower of Phillipsburg, N. J., and the new Charter Oak Lawn Mower. E. Myer of Newark made a good display of general farm implements including the new Howe Churn. The Dodge Implement and seed warehouse also made an excellent display of assorted implements comprising several new features. W. Foster Dodge himself was on the ground spreading his geniality among the visitors and assisting those in quest of information.

There were two new implements shown, viz: the Eureka Post Hole Digger and the Universal Sprinkler, descriptions of which will have to be deferred till a future time as I have already taken more space than can be spared, I imagine.

In the fruit and flower tent our old time friend P. T. Quinn dispensed luxurious smiles to all comers, especially the ladies; but found time to show me the excellent collection of fruit, including the Rickett's and Miner seedling grapes, with which the RURAL readers are somewhat familiar. In the matter of apples, New Jersey is decidedly strong and stands foremost in the race for quality. One glance at this display establishes that fact. I met your correspondent Mr. Hales in the Poultry Department so that I presume it is only necessary for me to say that it was one of the largest and best displays in that line which I have seen this year and he will say the rest at some future time.

The stock show was good; but as there was no catalogue or other means by which to acquire information on the subject, it must be passed. In the absence of catalogues why is the stock not ticketed for the information of visitors? But I will grumble no more, for, with all its faults, the Fair did honor to the Society and was far better than many State Fairs that I have attended.

SHORTHORN.

N. Y. STATE AG. SOCIETY.

ALBANY, Sept. 14, 1876.

LOWERING weather with considerable wind this morning. Towards noon it turned to drizzling rain and before 2 P. M. had developed into a heavy storm. This served to keep away all the late visitors and to drive off a large majority of those who had braved the threatenings of the morning. Some people however, came to see the Fair and so far as it was under cover accomplished their mission. The various buildings were well patronized, but the grounds almost deserted. This is the day when the crowds were expected and generally arrived, and the storm must be a costly one for the Society.

The judges in the various departments are somewhat tardy this year and have been working nearly all day to complete their awards, a large part of which I append hereto. Much discussion was had on the Live Stock, as many fine animals were exhibited. Mr. T. L. Harrison carried off the cream of the Short-Horn prizes, including the Society's Gold Medal. J. Carter Brown took heavily of the Jersey prizes also including the Gold Medal. Joseph Hilton was almost equally fortunate in Devonshires. Geo. Ayrault, who looks to the pecuniary results, seemed to be quite satisfied with his numerous ribbons, each representing a cash value. Among the horses Edwin Thorne and John H. Starin made fine exhibits.

Of course there was the usual complaints among the disappointed parties whose exhibits had failed to get awards, each one thinking that mistakes had been made by the judges. This is always to be looked for and seldom fails to be found where the exhibits exceed the number of awards. It would be good advice to tell them to try again.

Upon the whole this Fair was much more of a success as to exhibits than as to attendance. But, considering the Centennial, the weather and the hard times, I think the Society is to be congratulated that it was no worse, and to be highly commended for its courage and energy in doing what it did. For many courtesies in the acquisition of information I could not help extending thanks to Messrs. Williston, Maxon, Dickerman, Doncaster and Didima, who did all in their power to assist the representatives of the press in their quest for facts and figures.

Premiums Awarded on Stock, Fruit, &c.

CATTLE—SHORT-HORNS—Herd prize, large gold medal, T. L. Harison, Morley, N. Y.

Bulls over 3 years—1, Clarkson Bros., Potsdam, $40; 2, T. L. Harison, $25; 3, W. F. Blanchard, Manlius, $10.

Bulls, 2 years—1, Chas. F. Wadsworth, Geneseo, $30; 2, Benj. Fellows, Clifton, $20; 3, G. G. Maxon, Schenectady, $10.

Bulls, 1 year—1, T. L. Harison, $25; 2, D. B. Haight, Dover Plains, $15; 3, Chas. F. Wadsworth, $10.

Bull calves—1, T. L. Harison, $15; 2, C. F. Wadsworth, $10; 3, D. B. Haight, $5.

Cows over 3 years—1, T. L. Harison, $15; 2, N. M. Curtis, Ogdensburgh, $25; 3, G. G. Maxon, $10.

Heifers, 2 years—1, T. L. Harison, $30; 2, G. G. Maxon, $20; 3, D. B. Haight, $10.

Heifer, 1 year—1, T. L. Harison, $25; 2, do., $15; 3, C. F. Wadsworth, $10.

Heifer calves—1, W. F. Blanchard, $15; 2, C. F. Wadsworth, $10; 3, do., $5.

AYRSHIRES—Bulls, 3 years—1, S. B. Bradley, Adamsville, $35; 2, E. B. Hawks, Wells Bridge, $15.

Bulls, 1 year—3, S. B. Bradley, $10; No 1st and 2d awarded.

Bull calves—1, E. B. Hawks, $15; 2, S. B. Bradley, $10.

Cow, over 3 years—3, S. B. Bradley, $10.

Heifer, 2 years—3, S. B. Bradley, $10.

HOLSTEINS—Herd—O. B. Hinkley, H. Landworthy and others, West Edmeston, large gold medal.

Bulls, over 3 years—H. C. Hoffman, Horseheads, $25.

Bulls, 2 years—1, Clarkston Bros., $25; 2, O. B. Hinkley and others, $5.

Bull Calves—1, O. B. Hinkley and others, $15; 2, H. C. Hoffman, $10; 3 O. B. Hinkley and others, $5.

Cows, over 3 years—1, O. B. Hinkley and others, $20; 2, H. C. Hoffman, $15; 3, do., $10.

Heifers, 2 years—1, O. B. Hinkley and others, $20; 2, H. C. Hoffman, $15; 3, O. B. Hinkley and others, $10.

Heifers, 1 year—2, O. B. Hinkley and others, $15.

Heifer calves—2, O. B. Hinkley and others, $10; 3, do., $5.

MILCH COWS AND GRADES—Milch cows of any breed—1, O. B. Hinkley and others, $30; 2, do., $20; 3, H. C. Hoffman, Horseheads, $10.

Grade Short-Horn cows and heifers—1, George Ayrault, $20; 2, W. F. Blanchard, $15; 3, do., $10.

Grade Devon cows and heifers—1, Joseph Hilton, New Scotland, $20; 2, David Wait, Wells Bridge, $15; 3, do., $10.

Grade Ayrshire cows and heifers—2, E. B. Hawks, $15.

Grade Jersey cows and heifers—1, E. B. Hawks, $20; 2, Jeremiah Waterman, Albany, $15; 3, Wm. Swan, Scotia, $10.

Working oxen over 5 years—1, Benj. Fellows, Clifton, $20; 2, J. Hilton, $15; 3, E. Crawford, New Scotland, $10.

Pairs of oxen, 4 years—1, G. Ayrault, $20.

Pairs of steers, 3 years—1, G. D. Fletcher, $20; 2, G. Ayrault, $15.

Pairs of steers, 2 years—1, G. Ayrault, $20; 2, David Wait, $15.

Fat oxen over 4 years—1, G. Ayrault, $20; 2, G. Ayrault, Jr., $15; 3, G. Ayrault, $10.

Fat steers, 3 years and under—1, T. L. Harison, $20; 3, G. Ayrault, $10.

Fat cows over 4 years—1, C. F. Wadsworth, $20; 2, Joseph Hilton, $15; 3, G. Ayrault, $10.

Fat heifers, 3 years and under—2, G. Ayrault, $15.

JERSEYS—Herd prize, large gold medal, J. Carter Brown, East Greenwich, R. I.

Bulls over 3 years—1, E. Corning, $25; 2, J. A. & I. T. Burden, Troy, N. Y., $15; 3, B. J. Slade, Waterford, $10.

Bulls, 2 years old—2, Thomas J. Hand, Sing Sing, $15; 3, Edwin Thorne, Millbrook, $10.

Bulls, 1 year—1, T. J. Hand, $20; 2, W. Low, Rutherford, $15; 3, E. Thorne, $10.

Bull calves—1, J. C. Brown, $25; 2, T. J. Hand, $10; 3, E. Thorne, $5.

Cows over 3 years—1, J. C. Brown, $25; 2, T. J. Hand, $15; 3, J. P. Brown, $10.

Heifers, 2 years—1, T. J. Hand, $25; 2, E. Thorne, $15; 3, do., $10.

Heifers, 1 year—1, J. C. Brown, $20; 2, J. T. Hand, $15; 3, E. Corning, 10.

Heifer calves—1, J. A. & I. T. Burden, $15; 2, J. C. Brown, $10; 3, J. A. & I. T. Burden, $5.

DEVONS—Herd prize, large gold medal, Joseph Hilton, New Scotland.

Bulls over 3 years—1, B. F. Peck, East Bethany, $25; 2, J. Hilton, $15; 3, David Wait, Wells Bridge, $10.

Bulls, 2 years—2, Walter Cole, Batavia, $15.

Bulls, 1 year—1, W. Cole, $20; 2, Mrs. W. E. Arnold, Otsego, $15; 3, D. Wait, $10.

Bull calves—1, J. Hilton, $15; 2, B. F. Peck, $10; 3, J. M. Bachelder, $5.

Cows over 3 years—1, J. Hilton, $25; 2, B. F. Peck, $15.

Heifers, 2 years—1, J. Hilton, $25; 3, D. Wait, $10.

Heifers, 1 year—1, J. Hilton, $20; 2, W. Cole, $15; 3, B. F. Peck, $10.

Heifer calves—1, B. F. Peck, $15; 2, W. Cole, $10; 3, J. Hilton, $5.

HEREFORDS—Bulls over 3 years—1, Erastus Corning, $25.

Bulls, 2 years—2, Clarkson Bros., Potsdam, $15.

Bulls, 1 year—1, E. Corning, $20.

Bull calves—1, do., $15.

Cows over 3 years—1, do., $25.

Heifers, 2 years—3, do., $10.

Heifers, 1 year—1, do., $ 0.

SHEEP—SOUTH DOWNS—Ram over 3 years—1, Joan D. Wing, Millbrook, $15; 2, do, $10; 3, D. B. Haight, Dover Plains, $5.

Yearling rams—1, J. D. Wing, $15; 2, do., $10; 3, do., $5.

Ram lambs—1, D. B. Haight, $15; 2, do., $5.

Ewes over 2 years—1, J. D. Wing, $15; 2, do., $10; 3, D. B. Haight, $5.

Yearling ewes—1, J. D. Wing, $15; 2, do., $10; 3, D. B. Haight, $5.

Ewe lambs—1, D. B. Haight, $10.

SHROPSHIRES—Rams over 2 years—1, Bevosus Cook, Otego, $15; 2, William H. Parker, do., $10; 3, B. Cook, $5.

Yearling rams—2, Wm. H. Parker, $10.

Ram lambs—2 B. Cook, $5.

Ewes over 2 years—1, B. Cook, $5; 2, W. H. Parker, $10; 3, G. L. Fletcher, Sidney Centre, $5.

Year ing ewes—1, W. H. Parker, $15; 2, G. L. Fletcher, $10, 3, B. Cook, $5.

Ewe lambs—2, W. H. Parker, $5.

LONG WOOLED—LEICESTERS—Yearling rams—3, W. L. & W. Rutherford, Wadulington, $5.

Ram lambs—2, do., $5.

Yearling ewes—2, do., $10.

Ewe lambs—1, do. $10.

COTSWOLDS—Rams over 2 years—1, Geo. Ingersoll, Charleston, $15; 2, Wm. Potter, Johnstown, $10; 3, Geo. F. Mills, Fonda, $5.

Yearling rams—1, G. Ingersoll, $15; 2, do., $10; 3, W. Potter, $5.

Ram lambs—1, G. Ingersoll, $10; 2, Geo. Arault, Poughkeepsie, $5.

Ewes over 2 years—1, G. Ingersoll, $15; 2, W. Potter, $10; 3, G. Ayrault, $5.

Yearling ewes—1, G. Ingersoll, $15; 2, do., $10; 3, G Ayrault, $5.

Ewe lambs—1, G. Ingersoll, $10; 2, G. Ayrault, $5.

Lincoln yearling rams—2, W. L. & W. Rutherford, $10.

MERINO, BRED FOR FINENESS OF WOOL—Rams over 2 years—1, Wm. Chamberlain, Red Hook, $15; 2, do., $10; 3, Carl Heyne, Red Hook, $5.

Yearling Yams—1, Carl Heyne, $15; 2, Wm. Chamberlain, $10; 3, do., $3.

Ram lambs—1, Wm. Chamberlain, $10; 2, C. Heyne, $5.

Ewes over 3 years—1, Wm. Chamberlain, $15; 2, C. Heyne, $10; 3, E. Townsend, Pavilion Centre, $5.

Ewes 2 years old—1, Wm. Chamberlain, $15; 2, C. Heyne, $10; 3, E. Townsend, $5.

Yearling ewes—1, Wm. Chamberlain, $15; 2, C. Heyne, $10; 3, Wm. Chamberlain, $5.

Yearling lambs—1, Wm. Chamberlain, 10; 2, C. Heyne, $5.

MERINO, BRED FOR WEIGHT OF FLEECE—Rams over 2 years—1, E. Townsend, $15; 2, J. M. Bachelder, $10; 3, S. B. Lusk, $5.

Yearling lambs—1, S. B. Lusk, $15; 2, E. Townsend, $10; 3, Wm. Chamberlain, $5.

Yearling lambs—1, E. Townsend, $10; 2, S. B. Lusk, $5.

Ewes over 3 years—1, S. B. Lusk, $15; 2, E. Townsend, $10; 3, Wm. Chamberlain, $5.

Ewes 2 years—1, S. B. Lusk, $15; 2, E. Townsend, $10; 3, J. M. Bachelder, $5.

Yearling Ewes—1, E. Townsend, $15; 2, S. B. Lusk, $10; 3, Wm. Chamberlain, $5.

Lambs—1, S. B. Lusk, $10; 2, E. Townsend, $5.

MERINO, BRED FOR LENGTH OF STAPLE.—Ram over 2 years—1, S. B. Lusk, $15; 2, R. L. Harrison, Hoosick Falls, $10; 3, C. Heyne, $5.

Yearling lambs—1, S. B. Lusk, $15; 2, E. Townsend, $10; 3, R. L. Harrison, $5.

Ram lambs—1, S. B. Lusk, $10; 2, E. Townsend, $5.

Ewes over 3 years—1, J. O. Joslin, Flushoke, $15; 2, do., $10; 3, R. L. Harrison, $5.

Ewes over 2 years—1, E. Townsend, $15; 2, S. B. Lusk, $10; 3, R. L. Harrison, $5.

Yearling ewes—1, S. B. Lusk, $15; 2, E. Townsend, $10; 3, R. L. Harrison, $5.

Ewe lambs—1, E. Townsend, $10; 2, S. B. Lusk, $5.

HORSES—BREEDING AND DRIVING STOCK—Best stallion for general purposes over 6 years old and not less than 15.2 hands high—1, Commodore, exhibited by John H. Starin, Fultonville, $100; 2d, Col. Johnson, exhibited by W. V. Reynolds & Co., Schaghticoke, $50.

Best stallion for general purposes, accompanied by not less than five of his produce one year old or over—1, Champion, by T. W. & W. Gooding, Canandaigua, $100; 2, James M. Mills, Chosroe, of Bullville, $50.

Stallions over 5 years old and not less than 15.3 hands—1, Dexter Mohawk, Chas. Stanford, Schenectady, $30; 2, Alexis, G. R. Spaulding, Saugerties, $20.

Carriage stallions, 4 years old—1, Hathorn, Geo. C. Genet, Greenbush, $25; Young Coacher, A. W. Pontius, Auburn, $15.

Carriage stallions, 2 years old—1, black, Wm. W. Riegel, Seneca Falls, $20; 2, Fortune, James M. Mills, Bullville, $10.

Carriage stallions, 1 year old—1, black, A. Goldsmith, Washingtonville, $20.

Carriage mares not less than 15.3, with foals at foot—1, Lady Ashton, brown, J. M. Snyder, Melrose, $30.

Carriage fillies, 3 years old—1, brown, J. M. Mills, $20; 2, May Queen, bay, J. Julland, Bainbridge, $10.

Carriage fillies, 2 years old—1, bay, J. M. Mills, $20; 2, Eula Lee, bay, Joseph Julland, $10.

Carriage fillies, 1 year old—1, bay, John Cox, Cohoes, $20.

Roadster stallions over 5 years, less than 15.3 and not less than 15 hands—1, Commodore, bay, John H. Starin, $30; 2, Chosroes, bay, J. M. Mills, $20.

Roadster stallions, 4 years old—1, Marksman, bay, Edwin Thorne, Millbrook, $25; 2, Rob Roy, dark bay, G. W. Van Valkenburgh & Son, Chatham, $15.

Roadster stallions, 3 years old—1, Patriot, bay, Edwin Thorne, $20; 2, Cocheco, bay, H. B. Welling, Tomhannock, $10.

Roadster stallions, 2 years old—1, bay, J. M. Mills, $20; 2, Pioneer, bay, E. Thorne, $10.

Roadster stallions, 1 year old—1, Ensign, chestnut, E. Thorne, $20; 2, Glenville: bay, J. C. Ellis, Schenectady, $10.

Roadster mares, less than 15.3 and not less than 15, with foals at foot—1, Dolly VanDerheyden, O. T. VanDerheyden, Troy, $30.

Roadster fillies, 4 years old—1, Flirt, black, D. B. Haight, Dover Plains, $35; 2, gray, C. Stanford, $10.

Roadster fillies, 3 years—1, Lady Mary, bay, D. B. Haight, Dover Plains, $20; 2, gray, C. Stanford, $15.

Roadster fillies, 3 years—1, Lady Mary, bay, D. B. Haight, $20; 2, Jenny Geddes, gray, John Kirkpatrick, Albany, $10.

Roadster fillies, 2 years old—1, bay, J. M. Mills, $20. 2, no name, G. Bright, West Albany, $10.

Roadster fillies, 1 year old—1, brown, C. Stanford, $20; 2, gray, do., $10.

WORK HORSES—Farm or team horses, weighing less than 2,500, and not less than 2,000—1, S. L. Grove, Albany, $30; 2, I Van Allen, Bethlehem Centre, $15.

Carriage horses, not less than 15-3, nor more than 16-1—1, Jeremiah Waterman, $30; 2, J. H. Rowe, North Chatham, $15.

Carriage horses, less than 15-3, and not less than 15 hands—2, H. Kariger, Perry.

Single-harness horses, 15-3 or over—1, Seneca Dennis, Melrose, $20; 2, A. B. Larkin, Central Bridge, $10.

Single-harness horses, 15 and less than 15-3—2, C. W. Little, Albany, $10.

Saddle horses, 16-2 and over—1, C. B. Woolverton $20; 2, John W. McHarg, Albany, $10.

Ponies, under 14 hands—1, D. G. Bradley, Albany, $20; 2, Joseph Julland, Bainbridge, $10.

SWINE—LARGE BREED—Boars six months—Wm. M. Holmes, Greenbush, $15.

Breeding sows, 2 years—J. J. DeForest, Duanesburgh, $15.

Sow pigs, over 6 months—Wm. M. Holmes, $15.

Pigs, under 6 months—J. J. DeForest, $15.

Small white boars, 2 years—W. H. Cole, Clinton, N. J., $15.

Small white boars, 1 year—W. H. Cole, $10.

Small white boars, 6 months—J. S. Gibbs, Apalachin, $15.

Breeding sows, 2 years—W. H. Cole, $15.

Breeding sows, 1 year—do., $15.

Sow pigs, over 6 months—do., $15.

Pigs, under 6 months—1, do., $15; 2, E. B. Hawks, $10.

SMALL BLACK BREED—Sows, 1 year—J. S. Giles, $15.

Pigs, under 6 months—do., $15.

Berkshire boars, 2 years—1, Edwin Thorne, $15; 2, Isaac Van Allen, $10

Boars, 1 year—1, D. B. Haight, $15; 2, Benj. Fellows, $10.

Boars, 6 months—1, J. R. Stuyvesant $15; 2, N. M. Curtiss, $10.

Sows, 2 years—1, N. M. Curtiss, $15; 2, J. R. Stuyvesant, $10.

Sows, 1 year—1, C. S. Wyckoff, Cuba, $15; 2, D. B. Haight, $10.

Sow pigs, over 6 months—1, B. Fellows, $15; 2, G. L. Fletcher, $10.

Pigs, under 6 months—1, A. B. Larkin, Central Bridge, $15; 2, C. S. Wyckoff, $10.

POULTRY—Collection of pure bred poultry—J. Y. Bicknell, Westmoreland, silver medal.

Trios light Brahmas—1, D. C. Waterhouse, New Haven, $5; 2, J. S. Giles, Apalachin, N. Y., $3.

Buff, lemon or cinnamon Cochins—1, J. S. Giles, $5; 2, do., $2.

Partridge or Grouse Cochins—1, D. C. Waterhouse, $5; 2, J. S. Giles, $3.

Dark Brahmas—1, D. C. Waterhouse, $5; 2, do., $3.

White Cochins—1, J. Y. Bicknell, $5; 2, Wm. M. Wendell, $3.

Black Cochins—1, W. M. Wendell, $5; 2, J. G. Gooding, Castleton, $3.

Colored Dorkings—1, W. R. Hills, Albany, $5; 2, J. Y. Bicknell, $3.

Silver-Gray Dorkings—1, J. Y. Bicknell, $5; 2, O. Hawland & Son, Auburn, $3.

White Dorkings—1, W. M. Wendell, $5.

Dominiques—1, J. Y. Bicknell, $5; 2, S. W. Studley, Catskill, $3.

Golden-Spangled Hamburghs—1, J. Y. Bicknell, $5; 2, L. D. Ely, Rochester, $3.

Silver-Spangled Hamburghs—1, J. Y. Bicknell, $5; 2, L. D. Ely, Jr., $3.

Silver-Pencilled Hamburghs—1, J. Y. Bicknell, $5; 2, do., $3.

Black Hamburghs—1, J. Y. Bicknell, $5; 2, Wm. M. Wendell, $3.

Black Spanish—1, Wm. M. Wendell, $5; 2, O. Howland & Son, $3.

White Leghorns—1, J. Y. Bicknell, $5; 2, Wm. M. Wendell, $3.

Brown Leghorns—1, J. Y; Bicknell, $5; 2, Robert Lewis, Charleton, $3.

Plymouth Rocks—1, J. Y. Bicknell, $5; 2, D. C. Waterhouse, $3.

Crève-Coeurs—1, J. M. Seymour, Clark's Mills, $5.

Houdans—1, S. W. Studley, $5; 2, J. Y. Bicknell, $3.

Le Fleche—1, J. M. Seymour, $5; 2, J. Y. Bicknell, $3.

White Polish—1, E. G. Studley, Claverack, $5; 2, do., $3.

Other Polish—O. Howland & Son, $5.

Black-Breasted Red Game—1, J. Y. Bicknell, $5; 2, J. R. Stuyvesant, Poughkeepsie, $3.

Brown-Breasted Reds—1, T. C. Abrams, West Troy, $5; 2, S. Schuyler, do, $3.

Irish Grays—1, Wm. M. Wendell, $5; 2, T. C. Abrams, $3.

Pile Games—1, J. Y. Bicknell, $5; 2, T. C. Abrams, $3.

Other well-bred Game—1, J. M. Bachelder, Pownal, Vt., $5; 2, J. Y. Bicknell, $3.

Red Game Bantams—1, J. Y. Bicknell, $5; 2, Wm. M. Wendell, $3.

Pile Game Bantams—J. Y. Bicknell, $5.

Duckwing Game Bantams—1, J. M. Seymour, $5; 2, J. Y. Bicknell, $1

Gold Laced Sebrights—1, J. M. Seymour, $5.

Other Bantams—1, G. L. Fletcher, $5.

Bronze Turkeys—1, Geo. Ayrault, Jr., $5.

White Turkeys—1, O. Howland & Son, $5; 2, J. M. Bachelder, $3.

Buff Turkeys—1, O. Howland & Son, $5.

Gray or Narragansett Turkeys—1, Geo. Ayrault, Jr., $5; 2, C. L. G. Blessing, Slingerlands, $3.

Black Turkeys—1, O. Howland & Son, $5.

Pearl Guinea Fowls—1, Joseph Julland, Bainbridge, $5; 2, E. Van Allen, Bethlehem Centre, $2.

White Guinea Fowls—1, P. Van Wie, Bethlehem, $3.

Pea Fowls—1, Peter Van Wie, $3; 2, Jos. Julland, $2.

Bremen Geese—1, O. Howland & Son, $5; 2, do., $3.

White China Geese—1, Peter Van Wie, $5.

Brown China Geese—2, O. Howland & Son, $3.

Brown China Geese—1, do., $5.

Wild Geese—1, do., $5.

Rouen Ducks—1, do., $5; 2, Peter Van Wie, $3.

Aylesbury Ducks—1, J. Y. Bicknell, $5; 2, do., $3.

Cayuga Ducks—1, J. Y. Bicknell, $5; 2, O. Howland & Son, $3.

Muscovy Ducks—1, Geo. Ayrault, Jr., Poughkeepsie, $5.

Carrier Pigeons—1, J. Y. Bicknell, $3

Tumblers—1, Wm. M. Wendell, $3; , Wm. M. Wendell, $3.

Jacobins—1, J. Y. Bicknell, $5.

Blue Rocks—1, J. Y. Bicknell, $3; 2, do., $2.

Dragoons—1, Wm. M. Wendell, $3; 2, do., $2.

Antwerps—1, Wm. M. Wendell, $3; 2, do., $2.

Broken Colored Buck Rabbit—1, Wm. M. Wendell, $3.

Broken Colored Doe—1, do., $3.

Common Buck Rabbit—1, do., $3.

Common Doe—2, do., $2.

FLOWERS—PROFESSIONAL LIST—Best exhibition of roses—Ellwanger & Barry, $5.

Roses, 24 varieties—1, do., $5.

Roses, 12 varieties—2, do., $3.

AMATEUR LIST—Cut Flowers—1, E. Van Allen, $10; 2, Mrs. J. T. Van Namee, Pittstown, $5.

Verbenas—1, E. Van Allen, $5; 2, Mrs. J. T. Van Namee, $3.

Verbenas, 12 varieties—1, Mrs. J. T. Van Namee, $3.

Verbenas, 6 varieties—1, Mrs. L. Clement, Mechanicville, $2; 2, Mrs. J. T. Van Namee, $1.

Seedling Verbenas—1, Mrs. J. T. Van Namee, $1.

Exhibition of Annual Phloxes—1, Mrs. A. Stone, Stanwix, $5; 2, Mrs. J. T. Van Namee, $2.

Six varieties Perennial—1, Mrs. L. Clement, $1.

New Seedling Perennial—1, Mrs. L. Clement, $1.

Exhibition of Asters—1, Mrs. A. Stone, $3; 2, Mrs. J. T. Van Namee, $1.

Exhibition of Pansies—1, Mrs. A. Stone, $3; 2, Mrs J. T. Van Namee, $1.

Exhibition Ten Weeks Stock—1, Mrs. J. T. Van Namee, $3; 2, Mrs. A. Stone, $1.

Exhibition Everlasting Flowers—1, Mrs. J. T. Van Namee, $3; 2, Mrs. A. Bobby, Jonesville, $1.

Collection 20 plants in pots—1, L. Menand, $10; 2, Geo. Tweddle, $5.

Collection 10 plants in pots—1, L. Menand, $5; 2, Geo. Tweddle, $3.

Floral design or ornament—1, James Hendrick, $5; 2, L. Gloecker, Albany, $3.

Hand Bouquets—1, James Hendrick, $5, 2, L. Gloecker, $3.

Basket Bouquet—1, J. Hendrick, $5; 2, do., $3.

FRUITS—PROFESSIONAL LIST—Collection of apples—1, Ellwangar & Barry, $18; 2, James Hendrick, Albany, $10.

Twelve varieties of apples—Ellwanger & Barry, $3.

Best collection of pears—Do., $15.

Ten varieties of pears—Do., $8.

Six do.—Do., $5.

Best collection of plums—Do., $5.

Six varieties of plums—Do., $3.

Quinces—2, Do., $2.

Grapes—Do., $5.

Grapes, one native variety—Do, $2.

Watermelons—2, Lewis Brewer, Schenectady, $2.

AMATEUR LIST—Apples, ten varieties—E. M. Hoffman, Elmira, $3.

Pears, ten varieties—Mrs. J. Sproat, Rochester, $1.

Pears, six varieties—Do., $4.

Peaches, one variety—W. T. Burgess, Albany, $5.

Collection of Plums—1, Peter Van Wie, Bethlehem, $5; 2, J. H. Loncks, New Scotland, $3.

Exhibition of grapes—A. McCormac, Bath-on-the Hudson, $6.

Grapes, one variety—Do., $2.

Exhibition of foreign variety of grapes—1, Chas. W. Little, Albany, $6; 2, Douglass L. White, $3.

Grapes, one foreign variety—Do., $2.

Exhibitions of watermelons—E. Van Allen, Bethlehem Centre, $2.

Watermelon, one specimen—Do., $5.

SHORTHORN.

AMERICAN INSTITUTE FAIR.—The annual Fair of the American Institute is now being held at the Rink, Second Ave. and Sixtieth St., in this City. The usual display of the products of our varied industries can be seen in their best at this show, and we would advise visitors from the country to spend a few hours in examining them at the above place, as it will well repay the time spent. Residents of the city will also find much to amuse and instruct them, as doubtless many have learned in their visits to this exhibition in years past.

N. Y. HORTICULTURAL SOCIETY.—This new society held its second exhibition at GILMORE'S Garden the past week, and the display was an excellent one, fully meeting the expectation of members and the public. We congratulate the Society upon its brilliant success during its past year, and hope its future will be as bright as its advent gives promise.

Floricultural.

BEDDING PLANTS IN CENTENNIAL GROUNDS.

CENTENNIAL GROUNDS, Sept. 16.

OUR friends who have yet delayed visiting the Centennial and who count upon the outside floral display as an attractive feature, should delay not one day longer. Now everything is at its best; by which we mean that in most respects the floral display is so close upon perfect that only words of praise arise as we look over the gorgeous scene. A few minutes ago, a young lady, who seemed so delighted over all she saw, that every attempt at expressing her appreciation ended in joyful exclamations at the end of half-finished sentences—concluded thus: "Well I shall be more crazy to visit these grounds now that I have seen them, than I was before I came here"—and a truer compliment we do not believe the floricultural management have received.

A frosty night may now be looked for at any time and then adieu to the floral display which for tasteful arrangement, extent and brilliancy of color we have never seen equaled.

In front of Horticultural Hall and extending westward, is a basin the flat bottom of which is several feet deep, extending in the form of a narrow parallelogram perhaps 1000 feet or more in length by 40 in width. We look down upon this as upon a carpet, the ground-work of which is the green grass, while the huge figures thereof are the flowers and foliaged plants which thickly cover the soil in which they grow. In carpet designs, half the effect is lost unless the whole may be taken in at a glance; and this is secured by the banks which, as has been stated, are elevated several feet above the floor of the basin. The species of plants employed for this style of gardening in this climate are necessarily few. One is not, indeed, tempted to examine individuals any more than he would be the flowers or leaves or scrolls of a veritable carpet. The immense figures set in the greenest of grass and a perfect blaze of strongly contrasting colors are what hold the eye. Disappointment follows a close inspection of the plants used to produce this effect, as close scrutiny of a painting would set us to wondering how so artistic a landscape could be composed of parts so rude in themselves.

The Golden *Pyrethrum* for its light-green and compact, spreading habit, is employed to a great extent. *Alternantheras, versicolor, amœna, spectabile*, and *lalifolia* are invaluable for their variegated foliage, low-growth and easy propagation and cultivation. Of course the *Coleus* in its wide range of varieties is the main plant for those portions nearer the centers of figures where a taller growth is requisite to assist in forming the oval outlines, which give a depth of verdure and a rounded, solid appearance relieving the whole from the insipidity of utter flatness. *Centaurea maritima, gymnocarpa* and *candida*—*Coleï Verschaffelli, Bausei, Hendersoni*—*Achyranthes Lindeni* and *Gilsoni* form the majority of the plants in this basin. The number necessary to form one of these figures will surprise those who have not thought of it. We roughly estimated not less than 1500 in one figure about 25 feet in diameter.

One round plot 20 feet diameter is filled with *Vincas rosea* and *alba*, but it is not effective, the flowers being too scattered and the foliage not very ornamental.

On one side of this basin as we call it for the lack of a better name, are what might be considered two ornamental hedges. They are four or five feet wide and 50 feet long and consist, on the outer edges, of *Pyrethrum*, next dark *Coleï*, and in the middle and highest, of *Salvia*. Every 10 feet is a plant of variegated Japanese Maize.

The plant display of the Pacific Guano Co. comprises a great number and variety, forming one of the most attractive resorts of the decorative grounds. The Cotton plants (*Gossypium*)—many in bloom, some in fruit, are interesting to all who have never traveled in countries where they grow. They are in fact well-worthy of being cultivated in any garden. The flower is 3 or 4 inches in diameter, of a lemon-yellow color and dark eye. The leaf is of a dark green color and smooth texture resembling the Maple or *Hibiscus* in form, to which latter species it is closely placed in the Mallow family. In this collection are *Ricini* 12 feet high, the tallest we have ever seen in the North so early in the fall. Had a few more ornamental species been raised—such as *Gibsoni* and *sanguineus*—under the same culture they would have been striking for their foliage as well as for height. All of these plants have been watered with Guano water, the effect of which is thus designed to be shown.

Whatever may have been the deficiencies of the bedding flowers in the early part of the season and through the scorching summer which was enough to try plants' souls, few there are hypercritical enough to say aught against them now.

Those who love Ivies will be pleased and instructed by a survey of a bed by Messrs. HOOPES, BROS. & THOMAS devoted to them alone. There are 36 varieties, half of them variegated and several, as *H. arborescens Roegneriana* as different in appearance as vines of the same species well can be.

In the Japanese department, trained up lattices, are several vines with pinnate three-foliolate leaves, the leaflets lobed quite like a Sassafras. Its stems are hispid, long-jointed and irregular. But the whole vine is pretty and, if hardy, desirable, since its leaf and habit differ from those of other hardy vines. Its name is *Pueraria Thunbergiana* under the order Leguminosæ. Here also are variegated Morning Glories twining up strings not worth further remark.

In one of the deciduous plots we see one or two specimens of *Sambucus racemosa*, variegated emphatically with yellowish white. It is a decumbent, spreading shrub, prettier, we think, than the common variegated Elder. We note also a dozen of the dwarf *Catalpa*, a round, vigorous, bean-like bush that must sooner or later become more popular than it is—at least for special purposes.

There are about 50 of the now famed *Hydrangea paniculata alba* in full bloom, which, though the thyrses are not over half the size of more favorable seasons, are yet exceedingly showy.

We must not forget to mention that there is here a single specimen of *Ligustrum pendula*, the Weeping Privet, the first we have ever seen outside of the Rural grounds.

MISCELLANEA.

ARUNDO *donax* is now (Sept. 7) ten feet high in spite of the drought. This is a reed that seems not to know which it likes better, moisture or dryness.

Erianthus Ravennæ sends up its fine plumes to about the same hight. They are noble plants, both—and associated with *Bocconia Japonica* form a rare group. *Eulalia Japonica*, the new variegated grass, may well be added though less hardy than the others. It will, however, stand ordinary winters.

NOTES.

IN a note by M. DE SAPORTA communicated to a French society respecting the lowest temperature that can be borne by certain plants, *Eucalyptus globulus* suffered only in some of its smaller branches when the thermometer sank to 25° Fahr. The Lemon was killed nearly to the ground; *Dracæna indivisa, Chamærops excelsa, Cocos Australis* were unharmed. *Chamærops excelsa* withstood 6° Fahr.

Arboricultural.

EVERGREENS.

CENTENNIAL GROUNDS, Sept. 15.

THOSE who have a general impression that Evergreens are hard to transplant and about as likely to die as live, may learn how erroneous it is by glancing over the hundreds—yes, thousands—of trees and shrubs that have been removed to these grounds and are now, with so few exceptions as not to be worth mentioning, after passing through one of the hottest and dryest of summers, as healthy as if they had grown in their present positions from cuttings or seeds. In our own experience we may say that a smaller percentage of Evergreens die from being transplanted than of deciduous trees. If in the nurseries they have been transplanted as often as need be, or the roots cut around, which is the next best thing, and they are packed so as to reach their destination with the roots still moist—unless they are then recklessly exposed—we need not anticipate a single failure. The great number and variety of Evergreen plants exhibited afford a rare opportunity of selecting, by comparison, those which are most unlike; those which are most pleasing of their kinds and those which are best adapted, as regards form, size and color, to the grounds we desire to beautify.

The small size to which nurserymen's catalogues are necessarily confined and the extent of country, with varying soil and climate, over which they are distributed, forbid minuteness of detail—and, indeed, no minuteness of description, however accurate, can place before our eyes a plant as we may see it in the Centennial grounds. A visit to nurseries does not as well answer our purpose, since there are few, if any, which offer so many species and varieties as we have here collected together. Besides in nursery grounds, as a rule, considerable spaces are devoted to one species, the larger, as the plant is well known and universally popular. We have then, to walk from plantation to plantation, forgetting previous impressions as we receive new ones and, finally, half fatigued and impatient, make our selections with little of judgment and with much of haste, generally to repent in the leisure of several years afterwards. In nursery grounds, too, we do not feel at liberty to ask of our attendant the many questions we desire to have answered—questions which, to them, are painfully threadbare—and if we do, they are usually answered with that ready-made praise pardonable, perhaps, in those whose time is money and whose object is to sell all they possibly can. Now the specimens in the Centennial are all plainly and, for the most part, accurately labeled. One has, therefore, only to look them over leisurely; to note those which impress him most favorably; to write down their names and to inform himself, upon returning home, by then visiting nurseries—by the use of catalogues or the several books upon Evergreens, as to their hardiness and general adaptability to his own grounds.

Of Evergreens, HOOPES, BRO. and THOMAS make one of the most creditable and attractive displays, consisting of perhaps 200 different kinds. All are vigorous and healthy, and a circular plot is filled with specimens which, though of medium size, scarcely show a withered branch or leaf.

Biota orientalis Zuccariniana, the dwarf Japan Arbor-vitæ, we note as a neat, feathery, coral-like specimen of a bright green color. *Retinospora obtusa compacta* is one of the prettiest of the curly-leaved (as we may call them) sorts, differing from the species in being more compact and in possessing smaller leaves. This is called the Fu-si-no-ki (tree of the sun) by the Japanese and is, says GORDON, the glory of Eastern forests.

Juniperus Virginiana pendula will, under this name, or by its appearance, scarcely be recognized by those who do not bother with botanical terms, as a variety of our Red Cedar that flourishes along every hedge and worn-out field. *J. V. aurea variegata*, another variety of the Red Cedar is variegated with a bright golden color to the extent of half, and is a real beauty. We see no other specimen in the grounds. The variegated Austrian Pine sets one to putting on his glasses to discover the why of its variety name. We discover it at length in a leaf or so of the lower tufts of a yellow color. But the tree is a deformed, worthless thing, as compared with its noble parent.

We once received a *Pinus sylvestris pendula* from an Edinburgh nursery, as pendulous as the Weeping Norway Spruce. It was very odd, though not beautiful, and it is singular why it is not known in this country or even mentioned in most coniferous books.

We see in this collection the Lawson Cypress. The exceeding beauty of the many varieties of this Californian tree and its rapid growth make us greatly regret that it is not hardy for this latitude. To our friends further South we commend it as one of the choicest Evergreens known. It is readily grown from seeds, from which fact and its proclivity to seminal variation, are due the many distinct and charming varieties in cultivation. The golden and silver forms may here be seen.

Cryptomeria Japonica presents a distinct form of Evergreen characters, but it is not hardy in the Middle States.

Abies excelsa stricta (*conica*) is one of the handsomest of dwarf Evergreens, three or four feet in height, small and numerous branches, slender, short, closely-growing leaves, a perfectly conical form, and as hardy as any other of the Spruces. It is one of the best for those enchanting little plots of small Evergreens which may be formed in the smallest gardens, adding a charm not excelled by any other group of plants.

The plot of deciduous trees by Mr. THOMAS MEEHAN is not noted for beauty—indeed it is not, we presume, intended to be. It consists of 750 species and varieties of mostly hardy deciduous shrubs, vines and trees, and it is rarely that so extensive a collection is grouped together in so small a space. The opportunity of ready comparison and study thus offered, should place those disposed to avail themselves of it under obligations to Mr. MEEHAN, who has collected and arranged this arboretum at an expenditure, doubtless, of considerable time and money.

In the Evergreen plot of Mr. S. B. PARSONS, we may observe *Juniperus oblonga pendula*, which is quite hardy, from the north of China. It is a singular, pendulous Evergreen, that, at a little distance, might be mistaken for a toy Willow, so decided and airy is its droop. *Abies excelsa elata* and *monstrosa* are here alone to be seen. They are the strangest and most lawless of Coniferous subjects, and are really desirable for their homeliness. The branches are coarse and heavy, and little disposed to branch out. The terminal spring growth bends them down by its weight, adding nothing to symmetry, while the difference in the color between this and last year's leaves imparts a disconnected or disjointed appearance. We think *monstrosa* and *elata* must be identical, as there is no mention of the latter in any of the works at hand. If, however, they are distinct varieties, we should purchase *monstrosa* for its expressive name.

Abies Canadensis microphylla is for the dwarf Evergreen plots of which we have spoken another suitable plant. It might be called the Skeleton Hemlock, with some propriety, so fine and narrow are its leaves. It is as hardy as the species. A broad, dark-leaved variety, of dense growth, is marked *A. C. macrophylla*, which is, we think, a mistake.

In many collections the magnificent *Picea*, or, as Mr. HOOPES prefers to classify it, *Abies Nordmanniana*, is present, though one or two of goodly size have suffered, either from being transplanted or from the burning heat of July and August. The smaller ones, however, are as fresh as ever. This is one of the most beautiful and perfect Evergreens. From our own experience, we should say that, when planted in sandy soil, it will, during very severe winters, require shade from the mid-day sun, in the latitude of New York.

The Naturalist.

THE WAY ANTS FIGHT.

A CORRESPONDENT of Land and Water tells how ants fight in South Africa which, although not greatly differing from such contests in other genera, and in other countries still it is quite interesting, as are most tales told of these wise little creatures:

During the months of September and October, 1873, I was living in the dense bush, about six miles from Cape Coast Castle. Having much time at my disposal, I utilized it by noting the habits and natures of the various creatures inhabiting that beautiful, though deadly, country. I was particularly attracted by the vast hordes of ants which were to be seen every day marching over the narrow roads through the bush, and I determined to notice their habits as closely as possible. Perhaps it may interest those of your readers who have a taste for natural history, if I extract from my notes all that refers to these insects, for these particulars I have not yet seen noted in any work yet published. In the first instance I would mention their migratory habits. I was unable to discover the cause of the changes of abode they made, or what it was that induced them to take up their new quarters in any particular spot; but this was certain, they were constantly on the move, traveling along a sort of cutting or groove, made by their own countless footsteps.

I observed that besides the ordinary ants, not much larger than our own English insects, there were others, of about twice the size of their smaller brethren, and armed with a huge horny pair of "pincers" on the head. These insects always stationed themselves on the brow of the cutting, occasionally patrolling up and down, and evidently surveyed the movements of their friends below. I never saw those larger insects carrying a burden, or in any way assisting in the labors of the common ants; they seemed to me to act as a sort of leader, to direct the march of their brethren. I once placed obstructions in the trench to observe the conduct of the insects; I noticed that if the material was soft enough, the ants broke it up and carried it clear of the trench, by morsels, but a stone too heavy to move, and too hard to break up, they left alone, simply tunnelling under it!

While some of the insects were thus occupied, the column left the trench for the time, and as soon as all was clear, returned to the old course. I may as well mention that on these migratory marches the ants do not carry any burdens, either food or pupæ, as we see them do in England. I found by experiment that if the few leading ants were destroyed, the whole column turned back and retired; that if some of the insects in the center were killed so as to break the column, those in front went on; those behind retired. Here, it is evident that some means of communication must exist between them, for these advances and retreats were simultaneous and without confusion. With an anecdote of what remarkable organization these minute creatures are capable, I will conclude this somewhat protracted letter.

One morning a friend and I watched a column of ants starting from their home in the mud walls of a hut in our camp, and determined to follow them to their destination. They marched straight to the parapet, mounted its inner face, descended into the trench, and then mounted the opposite side and proceeded to the open ground there. They directed their course to a small mound of fresh earth, and there the leading insects halted, remaining at the foot of the hillock until the whole force was present. I have calculated the number of this Liliputian army, by the distance their column extended, allowing an average of four abreast, and a length of one-eight of an inch to each section of four, to be about 13,824, exclusive of the larger insects.

When the whole force was assembled, the little army divided; one part remained at the foot of the mound and ran round and round it,

the rest mounted to the top, and some of them entered the loose earth and speedily returned, each bearing a young grasshopper or cricket, dead, which he deposited upon the ground and returned for a fresh load. Those who had remained on the outside of the mound, took up the crickets as they were brought out of the earth, and bore them down to the base of the hill, returning for a fresh load. Soon the contents of the mound seemed to be exhausted, and then the whole force returned home by the same route as before into the trench and over the parapet, each with his burden of cricket food for the community.

I must confess that had I not seen this with my own eyes, I could not have believed it, for here was a regular foray, planned and executed with military precision, the country surveyed, and the depot of provisions known accurately before the march was made, and at the mound the prudential division of labor, and the care taken that none of their victims should escape. In conclusion, I would say, that improbable as these facts may seem, yet they were witnessed by myself and my friend, and we returned to our camp, wondering at the greatness of that Creator who could implant in these puny creatures of His hand, so marvelous an instinct.

WISE PUPPIES.

A VERY good story is told of two young shepherd dogs by the Florida Sunland, from which we make a few extracts showing how peculiar traits in dogs become hereditary. The dogs referred to under the name Buster and Lady Buster were descended from an illustrious race of Scottish shepherd dogs, therefore we can more readily believe the story told of their process:

Their owner kept his sheep at some distance from the house, and proposed deferring the training of his puppies until they had outgrown the levity of extreme youth, it being one of his principles that a naturally active brain should not be stimulated until the body to which it appertained had had leisure to develop—a favorite maxim of many modern educators.

But hereditary tastes developed in Buster and Lady Buster without the need of training, and simultaneously great tribulation fell upon the numerous geese, hens, and ducks of the poultry yard. Soon, at any time of the day, a shrill and confused cackling and squawking and gobbling might call attention to a whole procession of unwilling and terrified fowls—swollen and enraged turkey cocks, high stepping roosters, waddling ducks and agitated hens—all urged determinately and relentlessly forward by two small brown puppies, who, with marvelous sagacity and a most wonderful co-operation, managed to exert complete control over the heterogeneous mass, and at the same time to deftly keep within the ranks all whose temerity suggested a side-flight. The steady advance of the reluctant and protesting crowd, and the unconcern and yet animation of the puppies behind, was a laughable sight to see.

In vain, after this performance had been repeated again and again, did the mistress of the oppressed scold and coax and punish. Buster and Lady Buster bore moral suasion with perfect equanimity, and remonstrated against coercion with all the howls and yells of ordinary abused puppies, but a very few moments sufficed to wipe out the pain and the sense of disgrace, the moral lesson as well, and to set them to work slowly gathering together and manipulating their comrades of the poultry yard.

There came a morning when not a cackle or a quack broke the stillness which reigned round the house. The quiet was ominous, almost supernatural. Not a gobbler strutted, not a hen pecked anywhere in sight. Even the puppies were gone. What could have become of those hungry solicitors who besieged the doors every morning? The children set up a dismal wail. An immediate search was instituted. Some one predicted that where the chickens were there Buster and Lady Buster would be. So it proved. Down in the orchard, huddled closely together in a corner, we found the crowd of scared and bewildered fowls, chickens perched upon the backs of uneasy geese, goslings under the feet of irresponsible ducks, hens forgetting maternal cares, and treading their offspring under their feet in terror of their strange predicament, roosters and gobblers craning their necks in fear and indignation, all apparently spell-bound by the two bright-eyed puppies, who lay with half-closed eyes so near as to confine their victims in the closest quarters, watching so vigilantly that not a chicken could make a desperate dash toward liberty without being promptly arrested and driven back. Nor did they move at our approach. They only wagged their tails as if anticipating approval, and turned one intelligent eye upon us, while the other narrowly observed the flutter of every feather among their charge. But the fun of this sort of thing was wearing out. We forced the reluctant Buster and Lady Buster away, and that very night sent them down to the sheep pasture, that they might exert their talents in a legitimate way.

Domestic Economy.

RENDERING AN ACCOUNT OF EXPENSES.

MR. EDITOR:—"What do you think of this: "The Housekeeper's Memorandum Book is a splendid medium whereby an *accurate account* may be *rendered* unto *liege lords* of the *disposal* of cash *allotted* for housekeeping purposes."

That is what I saw in a newspaper the other day. May be you won't want to give the book an advertisement in this way; but it won't hurt you. The book is well enough, and what it is made for also is well enough; but I pity the wife of the party (I won't say man) that wrote the notice, "Accurate account to be rendered to liege lords for cash *allotted*." Catch me doing it! Perhaps you may suspicion by this time that I ain't married. Well, that's a fact; and what's more, I ain't likely to be, being near forty, and neither fat nor fair, and, what's most, I don't want to be, to any "liege lord" who would *allot* cash for housekeeping expenses and *demand* a rendering up of an accurate account therefor. Do you know how I'd do if I was? Some fine day, when he had a "few friends" to dinner, the dishes should be garnished after this manner:—"This turkey weighed 12 pounds at 25 cents a pound." "This butter cost 40 cents a pound." "Those potatoes cost $1 a bushel"—and so on through the whole bill of fare. I'd prove to the satisfaction of all present that I know how to keep accounts and how to render them accurately.

Now, I do know of some real good men—that is, as men go (I doubt if any of them are *real* good), who consult with their wives about what proportion of their (not his) income should be devoted for household expenses; but I am glad I don't know of any so mean as to demand an "accurate account" of the way it is used. But I suppose there are some who do it. Now, I believe in keeping accounts, and I do it myself. I don't buy a shoe-string or a hair-pin that I don't "set it down," and at the end of every month I can tell to a dollar what I have spent, but, thank fortune, I haven't got any "liege lord" to report to! If I had a husband and he should suggest such a thing, I should be very likely to get excited and say something sharp, although I am naturally a sweet-tempered and mild-spoken woman, and all the neighbors know it. Just as likely's not I should say, very mildly and very affectionately, "I won't do nothing of the sort, unless you will render up to me an 'accurate account of what you do with the rest of the money—' showing exactly how much goes for tobacco, how much for lager, and how much for"——but what do I know of the many things men spend money for that they oughtn't to?

I ain't none of them Woman's Rights "wimmen;" but I would show any man he couldn't snub me or tread on me without my knowing of it and my letting of him know that I knowed it.

I had to stop just here to drive the hens out of the garden—they are the greatest pests of my life—and while I was waiting to cool off before finishing up my letter, I thought I would read it over. I ain't used to writing for the papers, and I kinder think perhaps you will have to fix this up a little; but don't you ease up a bit on the fellows that can't trust their wives with money. Most likely they know how they fool away money their own selves, and so get to thinking everybody else does it too. And put it a little stronger, if you can, how everybody ought to keep accounts for their own information and guidance, but not because they are under any obligation to render them up to any "liege lords"—not by a jugful! ESTER.

Neuletown, N. J.

[We prefer to let the above letter stand as it was written, only adding that we entirely approve of the general idea of the writer, and are glad that she was able to retain her sweetness of temper while writing it. Some women get unduly excited under such circumstances and say things in their haste that they repent at their leisure. But the mildness with which our fair correspondent (we say *fair* notwithstanding her disclaimer) treats the subject, is remarkable.—ED.]

ORIGINAL RECIPES.

Broiled Squirrel.—Skin the squirrel, open down the back, wash thoroughly, and wipe dry with a towel. Put it on a gridiron over a slow fire and cook until tender. Season with salt and pepper while cooking. Serve with melted butter poured over it. Very tender and delicious.

Canning Pumpkins.—In answer to Mrs. E. J. W.'s inquiry in RURAL NEW-YORKER of Sept. 9, I send the following well-tested recipe:—Pare the pumpkin, cut it into small pieces, and cook it in as little water as possible until tender; when cool enough, strain through a strong cloth, or put in a colander until perfectly drained free of the juice; then put in jars and place them over the fire in cold water. Let them boil an hour or an hour and a half. Remove them from the fire and seal as you do any other kind of fruit. I have done pumpkin in the fall and had it to make pies of the following Fourth of July; and the pumpkin was then so good as when first cooked.—Mrs. L. M. T., *Brooklyn, N. Y.*

SELECTED RECIPES.

Fricasseed Beef.—Take any piece of beef from the fore-quarter, such as is generally used for corning, and cook it tender in just water sufficient to have it all evaporate in cooking. When about half done, put in salt enough to season it well, and half a teaspoonful of pepper. If the water should not be done out soon enough, turn it off and let the beef fry fifteen minutes, turning it often. It is very good, and preferred by some to the best roast beef. Make the gravy of the water turned off, or add water from the teakettle and one or two tablespoonfuls of flour. Serve with vegetables and salad, or apple-sauce.

Stewed Rabbit.—Wash and soak the rabbit thoroughly; then wipe it quite dry, cut it into joints, roll in flour, and brown it slightly in four or five ounces of butter, with some bits of lean ham; then pour on by degrees 1½ pints of gravy and stew the meat very gently an hour and a half or two hours; add salt if needed. When it has stewed a half hour or more, put in half the rind of a lemon, cut thin, and ten minutes before serving stir in a large dessert-spoonful of rice flour, mixed smooth with two tablespoonfuls of mushroom catsup, quarter of a teaspoonful of mace, and less of cayenne.

Another.—Boil the rabbit in a good deal of water and skim it so often as anything rises to the surface. Cook until tender. Make a gravy of sweet cream, butter and flour, a little parsley chopped fine, pepper, salt, and stew a few minutes. Serve in a dish, with the gravy poured over it.

Fried Rabbit.—After the rabbit has been thoroughly cleaned, put it into boiling water and let it boil ten minutes; drain it, and when cold cut it into joints; dip them into beaten eggs and then into fine cracker crumbs, seasoned with pepper and salt. Fry them in butter over a slow fire for fifteen minutes; simmer two or three strips of lemon-rind in a little gravy until it is well-flavored with it; boil the liver and heart of the rabbit until tender: mince them fine; thicken the gravy with an ounce of butter and a tablespoonful of flour; add the minced liver and heart; give the sauce a minute's boil, stir in two tablespoonfuls of cream, and last of all a small quantity of lemon juice. Dish the rabbit, pour the sauce under it, and serve very hot.

Hygienic Information.

DIO LEWIS ON WHOLESOME FOOD.

For Breakfast.—Oatmeal porridge with milk and sugar.

Or, Graham mush, with a little good syrup.

Or, cracked wheat with milk and sugar.

Or, baked potatoes with bread and butter.

Or, beefsteak or mutton chop, with baked potatoes and bread and butter.

If you are thin and need fat use the first three; if you are too fat use the last named two.

Drink cold water or a little weak coffee.

Dinner.—Beef or mutton, roasted or stewed, with any vegetables you may like (though tomatoes should be used sparingly), good bread and butter, and close the meal with a glass of weak lemonade. Eat no desert unless it be a little fruit, and eat nothing more until the next morning.

There is no rule in regard to diet about which I am so fixed in my convictions as that nothing should be eaten after dinner, and I think that the dinner should be taken early in the day, not later, if it can be so managed, than 2 o'clock. In regard to the precise hour of the dinner I am not so clear, though for myself 1 o'clock is the best hour; but in reference to the omission of the third meal, I have, after long observation, no doubt whatever.

Hundreds of persons have come to me with indigestion, in some of its many forms, and have experienced such relief in a single week from omitting the supper that I have, for a number of years, depended upon this point in the diet as the best item in the prescriptions for indigestions. I have never met one person suffering from indigestion, who was not greatly relieved at once by omitting the third meal.

Eat nothing between meals, not even an apple or peach. If you eat fruit let it be with the breakfast or dinner.

Cooked fruit is best for persons with weak digestion. I have met hundreds of people who could digest a large beefsteak without a pang, but could not manage a single uncooked apple.

I think certain dietetic reformers have somewhat overrated the value af fruit.

Avoid cake, pie, all sweetmeats, nuts, raisins and candies.

Manage your stomach as above, and at the end of ten years you will look back upon those table habits as the source of a great advantage and happiness.

For thirty years I have been a constant and careful observer, (I have no hobbies about diet) and in the light of my own experience and these long observations, I assure you the table habits I advise are vital to health and happiness.

DECEPTIVE BEVERAGES.

IN corroboration of what was said in the RURAL NEW-YORKER Sept. 9, regarding home-made wines and similar drinks containing alcohol, we quote the following about ginger-beer from the Chemist and Druggist:

It may perhaps startle many total abstainers to learn that one of their favorite beverages, ginger-beer, is really a fermented liquor, and contains alcohol in proportions varying from two to four or five per cent. Nevertheless, such, according to Dr. Bathurst Woodman, in the Sanitary Record is the case. "I should be very sorry," writes that gentlemen, "to diminish the sale of ginger-beer, which I regard as one of the best of our summer beverages, containing, as it does, in almost all samples, either free citric or tartartic acid, or the almost equally beneficial bitartrate of potash. I have before me the recipes of several large makers, and take the first that comes to hand. It contains besides ginger, tartaric and citric acids, 200 pounds of sugar to 180 gallons of water. These ingredients are duly fermented, &c., and bottled. Now, 200 pounds of sugar (cane sugar) will produce in fermentation nearly 100 pints of alcohol; and making all allowances for loss in yeast, by evaporation in bottling, &c., it is quite plain that this liquor will contain about four per cent. of alcohol, and the result of actual experiment shows the same. The other recipes only differ slightly in the amount of the saccharine substance, as regards the water, or the kind of sugar present, or the acid employed. This percentage of alcohol is of course, about half the strength of most of the malt liquors in common use by the middle classes of this country, but about equal to many of the cheaper ales, and to much of the beer drank in Germany and other parts of the Continent."

NERVOUSNESS AND NERVINES.

NERVOUSNESS, says Cassell's Magazine, is one of the prices we have to pay for civilization; the nervous savage is a being unheard of. For this disorder, which is partly of mental and partly of a bodily nature, relief is sought in various ways, and among these we may place the employment of narcotics. The temporary relief afforded by these drugs is very apt to lead those who suffer from nervous sensations to put too much trust in and resort too frequently to them. In the long run they prove most destructive to health. Their use of late has become so frequent as to threaten society with a serious evil. It has been boldly contended that chloral is to be found in the work-boxes and baskets of nearly every lady in the west end of the metropolis, "to calm her nerves." No doubt this is an exaggeration, but it is a fact that in New York chloral punch had become an institution scarcely a year after the introduction of chloral into medical practice. And now it turns out that Germany—"sober, orderly, paternally-ruled Germany"—has such a thing as morphia disease spreading among its population. The symptoms are not unlike those of opium-eating. Experience suggests that persons suffering from this disease should at once be deprived of the drug. Their willfulness and liability to relapse, however, are so great that it is said that only about twenty-five per cent. have been seen to recover in a large series of cases.

A SIMPLE REMEDY FOR SMALL-POX.

EDWARD HINE, a correspondent of the Liverpool Mercury, in a communication to that paper speaks as follows:

I am willing to risk my reputation as a public man if the worst case of small-pox cannot be effectually cured in three days, simply by cream of tartar. This is the sure and never-failing remedy: One ounce of cream of tartar dissolved in a pint of boiling water, to be drank when cold, at short intervals. It can be taken at any time, and is a preventive as well as a curative. It is known to have cured in a hundred thousand cases without a failure. I have myself restored hundreds by this means. It never leaves a mark, never causes blindness, and always prevents tedious lingering. If the people would only try it and report all the cures to you, you would require to employ many columns if you gave them publicity.

IT'S A PITY.—Yes; its a pity that with all the nostrums in use for curing a sick person, and the thousands of good rules to be observed for keeping onesself in health, people will get sick and die. The why of all this we leave for the doctors to determine.

"PROGRESS AND IMPROVEMENT."

PRICES ARE FALLING!

THE PRICE OF

THE RURAL REDUCED TO $2.50

TO SUIT THE TIMES.

Club Prices Reduced Proportionately.

Mindful of the great encouragement which has been extended to us in our efforts to improve THE RURAL, *we have concluded to show our appreciation of the same by reducing the price of* THE RURAL *to $2.50 per year,*

POSTAGE INCLUDED.

By doing this we ourselves pay the postage, which has heretofore been paid by the subscriber. In addition to this, we inaugurate a graduated scale of prices for small clubs, so that all who send names with their own, up to ten, can get a reduction for each name so sent. And for a club of ten or more, a beautiful premium in addition. Now that THE RURAL *has come down, let each subscriber send with his or her own name that of at least two neighbors. Those who wish to become new subscribers or agents can receive Specimen Copy and Premium List free. Address*

WHAT HAVE I LEARNED?

THIS is a very simple question to ask one's-self, but frequently a difficult one to answer. However much we may dislike to consult past events, it becomes positively necessary in all rural affairs in order to insure substantial progress in the future. The growing season is nearly over, and the farmer and the gardener may now safely ask himself the question, what have I learned which may be of benefit to me next year? What crops have paid me best and upon what kind of soils and under what kind of treatment have they succeeded best? Also, what breeds of stock have shown themselves the most profitable and least adapted to my locality and circumstances? The question, which I should prefer to keep, or what I would prefer to do? must frequently be substituted for, what can I do to the best advantage? for circumstances and local conditions are often hard taskmasters, consequently, it is better to acquiesce in their demands than revolt and fare worse.

The farmer should be able to learn from past experience how to avoid a repetition of errors. If his wheat failed on a certain piece of land through a superabundance of water standing upon the surface or remaining in the soil, it ought to teach him that draining in some form was demanded in order to avoid such losses in future crops, and in such instances the question we have propounded is quite pertinent, although it is to be feared that many proceed on the hypothesis that through good luck another failure may, by chance, be averted. Animals may be lost or nearly ruined through an insufficiency of food or exposure to the cold storms of winter, and while some men learn useful lessons from such disasters and make provision for avoiding them in the future, others soon forget, or hope and "guess" the like will never occur again. It is just here that we find the key which opens the doors of success to one class, or keeps them closed to another. To the first every event in and phase of their business, becomes a matter worthy of thought and study from which something useful is learned.

The visionary man who builds "air castles" or looks forward to some grand event or wonderful turning point in his fortunes is proportionately more liable to disappointments than he who seeks only small things, steadily gathering them in as they come in his way. This principle holds good in the acquisition of useful knowledge, and he who learns a little from each success or failure and makes a good use of such accumulations, can scarcely fail to become one of the wise men of his profession. It is an old saying, that "Experience is one of the best of teachers;" but some learn more and much faster under the same tutelage, hence the difference in the results, one reaching a higher plane than another. The frequent assertions "that farmers should work more with their brains and less with their hands," was doubtless prompted by the far too frequent and apparent neglect to profit by their own individual experience. But it is probably unnecessary to pursue this subject so far as to particularize the various phases which it assumes when applied to the practical details of agriculture or horticulture; still, we earnestly conjure our readers to heed the question asked above, and if no good come of it they may rest assured that either the season has been ill-spent or their perceptive faculties are greatly at fault.

TUBE WELLS.

EXPOSURE OF THE EXTORTIONISTS.

UPON another page will be found a complete history of this system of direct taxation inaugurated by a few adventurers and assisted by the excessive stupidity of the Patent Office at Washington. All those of our readers who have Tube Wells should carefully peruse the article and from it get a definite idea of the enormity of this extortion.

It seems that one Col. GREEN while quartered with his regiment in N. Y. State just before the war of the Rebellion, suggested that water might be obtained by inserting a tube in a hole made in the ground by an iron bar and directed one of his Lieutenants named MUDGE to make the experiment. It was made, and proved a partial success. MUDGE subsequently, with the aid of one SUGGETT, a well digger, drove a number of wells on this principle but finding it unprofitable, abandoned it. SUGGETT afterwards continued the business and made it both successful and profitable. In the meantime, Col. GREEN had been dismissed from the army and, with plenty of leisure on his hands, watched SUGGETT's progress. Success being assured, he applied for and obtained a patent upon Tube Wells. This was about 1867. In the meantime, in 1863 SUGGETT had obtained a patent and in 1865 MUDGE had also obtained one, all of them being upon nearly the same thing. In 1866 the three fought it out at the Patent Office upon a declaration of difference and MUDGE was thrown out in the cold upon all his claims.

SUGGETT had become rich on his patent for tubular drill and its points and perforations, MUDGE had been thrown out of the race, and GREEN had his patent upon the process of sinking the hole in the ground. Unfortunately however, long before either of these noble patentees knew the difference between a well and a cistern—in 1829—a reprint of MAC KENZIE's 5,000 Receipts, publishes to the world "a receipt to raise water in all situations," which is substantially the processes covered by GREEN's and SUGGETT's patents.

GREEN has now set about exacting royalty upon all Tube Wells. Here is the direct taxation and the extortion—compelling innocent people to pay royalty to a patent which should never have been issued and which cannot stand. GREEN has already secured one decision in his favor and will make the most of it till it is reversed. His system is to summon a man by process to court so far away that he would rather pay than contest. In union is strength, and certainly this should be resisted by every one before GREEN is emboldened to do greater damage. It is, to be sure, a difficult thing to ask one man to take up a fight of principle for the community's benefit; but when it is considered that there are, at a low estimate, 750,000 of Tube Wells in the United States, a resistance has only to be known to receive substantial sympathy.

RURAL NOTES.

The Great Explosion.—On our news page this week will be found a condensed account of one of the most wonderful pieces of engineering work ever known. An accurate calculation of the power of 50,000 lbs. of nitro glycerine at a given point upon certain resistance of rock and water, resulted in a complete success without damage to anything except the rock intended to be destroyed. Gen. NEWTON, like his namesake, has taught the world something before unknown, and entirely disappointed the croaking prophets who looked for terrible damage all over the island of Manhattan, when Hallett's Point explosion should take place.

The Fifth Annual Session of the National Agricultural Congress occurred at Philadelphia, Sept. 12–14. Several addresses were made, among which was the address of welcome by Dr. KENNEDY, of the Philadelphia Polytechnic College. This was followed by papers and address by BURNET LANDRETH, W. C. FLAGG, G. E. MORROW, JOS. HARRIS, J. R. DODGE, Dr. E. L. STURTEVANT, (read for him,) L. F. ALLEN, X. A. WILLARD, ALEX. DALMAR, THOMAS CLAIBORNE, THOS. P. JANES, President WELCH, of Iowa College of Agriculture and Prof. TOWNSEND of Ohio. The next Annual Session will take place at Chicago.

Holland Horseradish.—The London Garden reports that large quantities of Horseradish at this time is being imported into Covent Garden Market from Holland. It is closely packed in bundles, each containing about twenty-four sticks, which are arranged tightly in large casks or butts, each holding 200 or 300 bundles. This kind of produce is now selling at from 3s. to 4s. per bundle; indeed, the price is the same all the year round. Horseradish is one of the most reumnerative of all market garden crops; it will grow on any deep, rich soil, and it requires but little labor after planting until the produce is dug for market.

Fighting Wheat Rings.—The Grangers of California are reported to have united to break up what is termed the "Wheat Ring," and they propose to ship their thirty million bushels of wheat direct and on vessels chartered by themselves. Of course, in doing this they form another "Wheat Ring," or break up one monopoly in organizing another; but as competition is said to be the life of trade, we can only wish the Grangers success in this enterprise.

Jerusalem Artichoke.—The Jerusalem Artichoke plantations made in the RURAL'S EXPERIMENTAL GROUNDS last spring, have been a grand success in spite of the severe drought. Small pieces of tubers planted last spring have made a splendid growth; the plants are now in bloom, the stalks being six to eight feet high. There are two varieties, but which will prove to be the most productive cannot be determined until the tubers are dug. We are quite sure that in these plants farmers may defy droughts in producing food for hogs and fodder for cattle.

Carbolic Acid and Silk-Worms. One of our scientific Entomologists has been experimenting on the diseases of silk-worms and reports to us that he has succeeded in preventing disease with some of the most delicate species by keeping the air in the feeding room slightly perfumed with carbolic acid. Of course, not enough should be used to injure the worms, but only sufficient is evaporated to be perceptible to the olfactories of a person on coming in from the open air. Will some of the raisers of the silk-worm give this a trial and report results?

N. J. Cranberry Growers' Association.—This organization held a meeting at Philadelphia, Sept. 5, at which there was a large attendance. Reports were made by the Foreign Trade Committee and also the Stand Measure, and many other useful reports given upon various other interesting matters connected with this industry.

RURAL BREVITIES.

THE monthly consolidated crop reports sent out from the Department of Agriculture of the State of Georgia, is a model of brevity and how to condense a great amount of information into a small space.

THE various State and County Fairs throughout the country have thus far been well attended, although the Great Centennial may have drawn away some exhibitors and visitors through its immense attractiveness.

THE Thwack raspberry is a new variety now claiming attention and highly indorsed by many persons who have seen it, but we are not aware that it has been cultivated in the Eastern States. See advertisement in our column this week.

THERE appears to have been more than the usual number of deaths this season among noted thoroughbred animals. Perhaps this has been the result of over-feeding or care in getting the animals in fine trim for exhibition purposes.

ATTENTION is called to the Horse-power advertisement of the Bellaire Manufacturing Company, in another column. The necessity for a light power such as this has long been felt, and those interested will do well to correspond with the manufacturers.

WE have received from R. S. JOHNSON of Stockley, Del., his wholesale Price List of Nursery Stock. Those who contemplate the purchase of Fruit Trees this fall or next spring, would do well to send at once for this List and get from it an idea of Mr. JOHNSON's prices.

IF it should be clearly shown that the grouse on the prairies and among the mountains feed upon grasshoppers and their eggs almost exclusively, as our best authorities on this subject claim, it may be necessary in the future to protect these birds by stringent laws enacted by our National Government.

WE are in receipt of a catalogue of the Moundale Herd of Bates and Princess Short-Horns, property of H. P. THOMPSON, Esq., of Thompson Station, Clark Co., Ky., to be sold at auction Wednesday, Oct. 11. This catalogue is gotten up in superb style, with portraits of some of the finest animals in this noted herd which, to our mind, shows that breeders of Short-Horns are far from losing any faith in the present or future of this celebrated breed of animals.

IT is quite amusing as well as instructive to get a nurseryman's catalogue like one just received of the Honey Moon Nursery of Jacksonville, Florida. The Proprietor, L. A. HARDEE, does not praise or recommend all the articles he keeps on sale, but gives his opinion of varieties in language which cannot be well misunderstood. For instance, in speaking of the Guava, he says, "Cannot be grown in any part of Florida for profit."

GIFFORD'S CATTLE STANCHIONS, invented and made by W. C. GIFFORD, Jamestown, N. Y., are attracting no small attention among Dairy and Stock men. Their introduction has operated something like an adhesive plaster—they stick whenever and wherever introduced. Our Dairy Editor, Mr. WILLARD, says of them:—"The most perfect cattle fastener in use. I fully recommend their universal adoption"—which is vigorous language for one of Mr. W.'s known conservatism concerning new inventions. Mr. GIFFORD is a pleasant man to deal with, and Ruralists who are interested in the subject will not do wrong in investigating a meritorious novelty. Circulars, &c., free.

WHAT THE BULLET SANG.

O joy of creation,
To be!
O rapture to fly
And be free!
Be the battle lost or won,
Though its smoke shall hide the sun,
I shall find my Love—the one
Born for me!

I shall know him where he stands,
All alone,
With the power in his hands
Not o'erthrown;
I shall know him by his face,
By his godlike front and grace
I shall hold him for a space,
All my own!

It is he—O my Love!
So bold!
It is I—all thy love
Foretold!
It is I. O Love, what bliss!
Dost thou answer to my kiss?
Ah, sweetheart, what is this?
Lieth there
So cold! [*Bret Harte.*

NOMADIC LIFE.

THE accompanying illustration gives a spirited idea of Bedouin life and manners. The Bedouins roam over Arabia, Irak and the eastern and southeastern parts of Syria. They live in tribes of from two hundred to twenty thousand, moving from place to place as the exigencies of their flocks and herds require. From the earliest ages they have led a pastoral life, dwelling in tents and rearing cattle with which they supplied the cities, going out on plundering excursions or spending their leisure time in horse-racing, athletic sports, story telling and, since the introduction of tobacco, smoking. All domestic labor, except milking and spinning, is left to the women and slaves. The women also perform the part of hair-dressers to their husbands in curling their locks. The Bedouin despises all labor and is proud of his liberty and genealogy, which he traces back to MOHAMMED, ISHMAEL, or JOKTAM.

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 205.]

MICHIGAN.

By the treaty of 1783 all forts and military posts within the line named as the boundaries of the United States, were to be surrendered by Great Britain; but in many places in the northwest this was not done at once, and it was not until 1795 that Detroit, the principal post in Michigan, was occupied by Federal troops. From this time Michigan was included in the Territory Northwest of the Ohio.

In 1805 that part of the country now known as the lower peninsula, was organized with a Territorial Government. To this was added in 1818, when Illinois became a State, all that portion of the Northwest Territory lying north of Indiana and Illinois. In 1835 the residents of the lower peninsula formed a Constitution, preliminary to application for admission as a State. This Constitution declared the southern line of Michigan should be the line fixed by the ordinance of 1787, which was the meridian of the southern extremity of Lake Michigan, and which it was supposed would intersect the northern boundary of the United States somewhere in Lake Erie. This supposition was erroneous, Lake Michigan extending further south than was then believed. It will be remembered that on the admission of Ohio it was determined that should this line be, as was suspicioned, further south than it had been supposed to be, then the north line of Ohio should terminate at a point on Maumee Bay about seven miles above the line of 1787.

Now as Michigan was about to have a State Government, some of the people residing between these two lines — that claimed by Michigan known locally as the Fulton line, and that claimed by Ohio known as the Harris line — found it would be more convenient for them to belong to that State, while most adhered to Ohio and petitioned that State to support them in their rights as citizens thereof. There were enough of the minority to make a very respectable opposition and a double set of local officers were appointed. A sheriff acting under Michigan authority arrested some persons who rebelled against the law as he understood it, and conveyed them to Monroe, where was the jail of the county of that name. This was looked upon by some as an outrage.

"Then there was mounting in hot haste; the steed,
The mustering squadron and the clattering car,
Went pouring forward with impetuous speed,
And swiftly forming in the ranks of war."

Ohio troops, led by their Gov. LUCAS in person, marched, early in 1835, to the scene of action and encamped at old Fort Miami, eight miles above Toledo and four miles above the disputed territory. Whether this was in ignorance, by mistake, or with a desire to carry the war into the enemy's country, doth not appear.

In the meantime, the Michigan soldiers were on the war-path. By an adroit flank movement they marched around the Buckeye troops, entered Toledo and took possession of the town. "Here," saith the record, "they overran the watermelon patches, made fowls very scarce, demolished utterly the ice-house of Major STICKNEY, burst open the front door of his residence and carried him off, as a prisoner of war, to Monroe."

But now appeared upon the field of action the white-winged angel of peace—in fact, two of them, in the persons of RICHARD BUSH, of Pennsylvania, and Col. HOWARD, of Maryland, ambassadors from Congress, with power to negotiate. An armistice was declared, the armies dispersed soon after, and the question at issue was referred to Congress, which, at its next session, proposed to Michigan to surrender all supposed rights to the tracts in controversy which contained less than 1200 square miles, and receive therefore that immense territory now called the Northern Peninsula, so well known for its rich mineral deposits. This proposition was at first declined; but on more mature deliberation it was accepted, and Michigan, with its present bounds, became a State in 1837.

THE NORTH-EASTERN BOUNDARY.

Very soon after the Treaty of 1783, difference of opinion arose as to the boundary between Maine and Canada, and occasional collisions took place between the settlers on the borders. These finally became so frequent and engendered so much ill feeling, that it was felt necessary by the Government of Maine to appropriate means and send troops to the disputed territory to protect the rights of its citizens. Fearing some hasty action would be taken, Mr. TYLER, then President, sent Gen. SCOTT thither to use such conciliatory measures as would preserve peace, pending negotiations. In the meantime, the correspondence between the two countries on this and other questions, had reached a serious point.

Finally, on intimation to the British Government that a commissioner empowered to discuss and settle all questions at issue would be received in a friendly spirit, Lord ASHBURTON was appointed and Mr. WEBSTER, then Secretary of State, represented the United States Government. Beside this Maine boundary, several other matters received their attention, among which was the northern bounds of New York, from Lake Champlain to the St. Lawrence. These had been fixed by the treaty of 1783 on the 45th parallel of longitude, and in 1774 a survey to establish boundaries was made. To this line so fixed, the State of New York extended its jurisdiction, and the Federal Government began the erection of extensive fortifications at Rouse's Point, at the head of Lake Champlain. But in 1817-18 a new survey was made with better instruments and more care, which showed that the old line, instead of being on the 45th parallel, coincided therewith only at a single point, and that the United States' fortifications had been erected on British territory more than half a mile above the line.

Now the country in Maine between the disputed boundary lines, was in itself of but little importance, being sterile and rocky. But Britain coveted it for the reason that though it was the best route for a road from New Brunswick to the Upper St. Lawrence, and in consideration of the cession of that portion lying between the upper portion of the St. Johns River and the line as claimed by the United States, granted the free navigation of said river and established the northern boundary of New York on the line as run in 1774. This left the north and northwestern boundaries of Maine to be the St. Johns and St. Francis Rivers to Pohenagamiok Lake and thence in a southwesterly direction along the highlands to the northeast corner of New Hampshire. To satisfy Maine and Massachusetts for this portion of their territory so ceded and to which they had undoubted right, the Federal Government paid the States $5,000,000.

THE NORTH-WESTERN BOUNDARY.

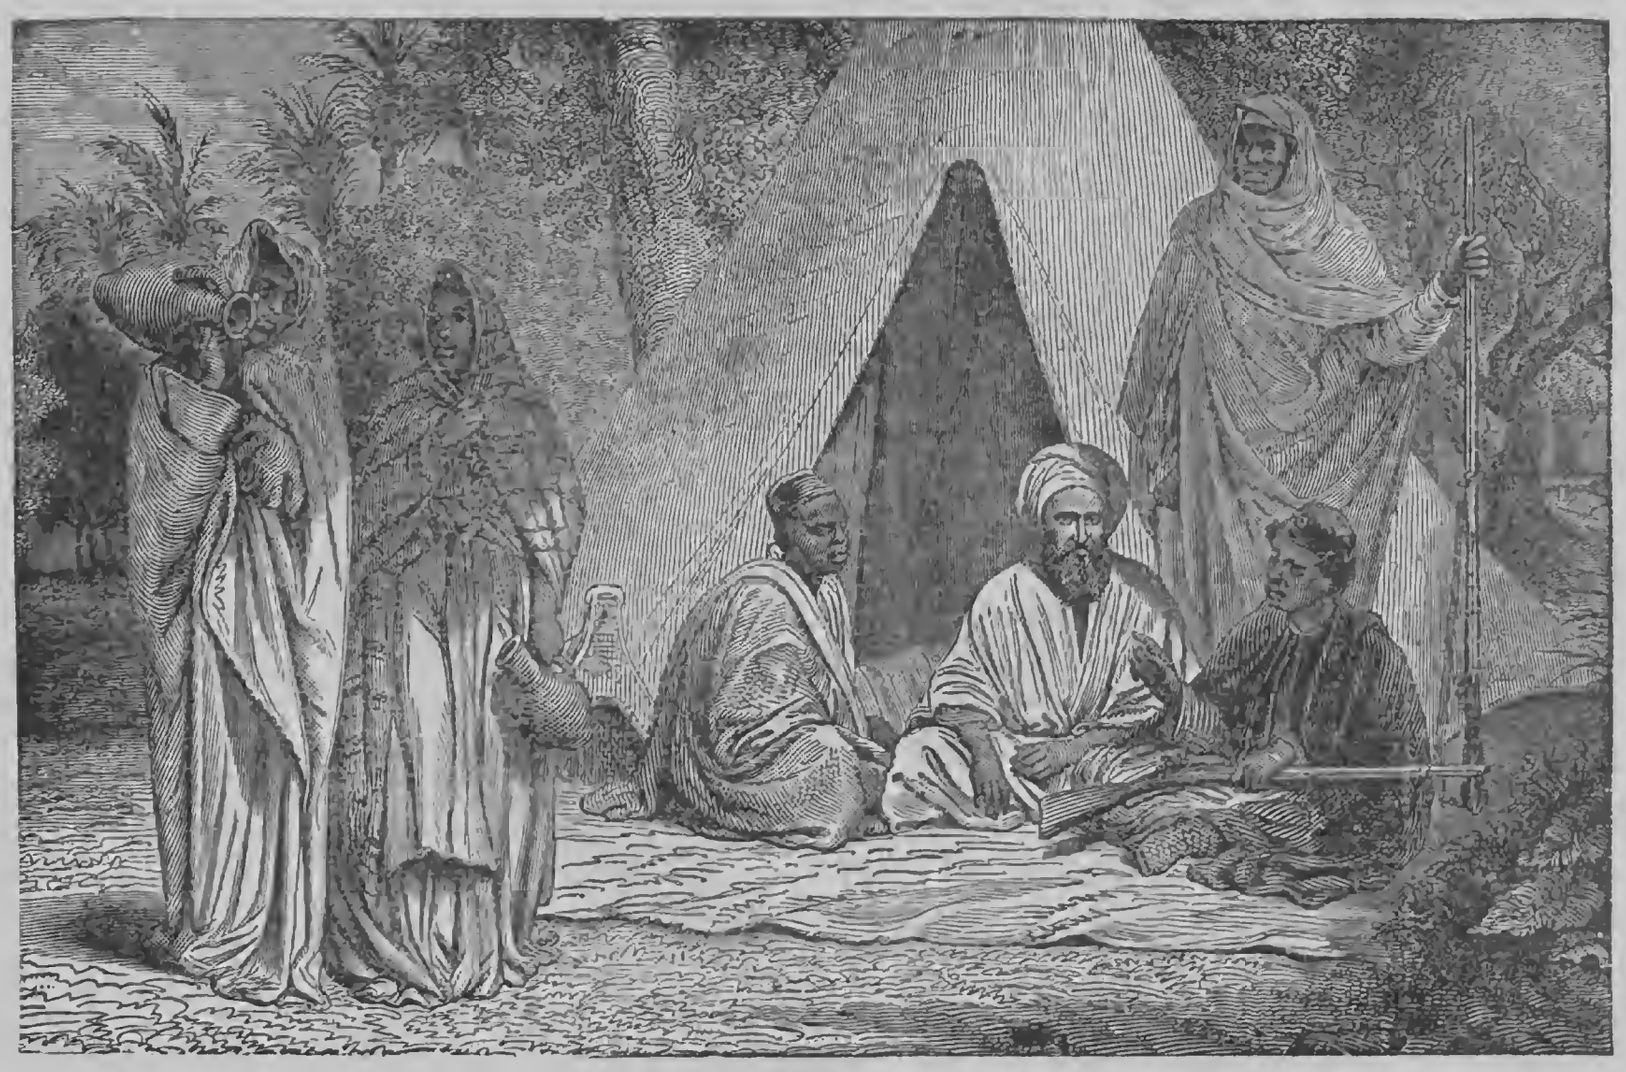
While the question of the annexation of Texas was (particularly in the South) occupying public attention, the unsettled north-western boundary seemed likely to be a source of trouble with Great Britain. By treaty made at London in 1818, the 49th° had been fixed as the boundary line between the two countries from Lake of the Woods to the summit of the Rocky Mountains, leaving the line further west to be determined at a future time. And now—in 1844—at the instance of Great Britain, the question was taken up. Mr. CALHOUN, then Secretary of State, proposed to continue the line on the 49th° to the ocean. Britain would not consent, claiming that when the line on the 49th° reached the Columbia, it should follow that river to its mouth. The grounds for the British claim south to Columbia River were, settlement by the Northwestern Fur Company on the head waters thereof and also on Frazier River, the explorations of MCKENZIE who, in 1793, found the upper waters of the Columbia and reached the Pacific in latitude 52° 20′, and occupation of Astoria in 1812, which had not been relinquished. No agreement was reached.

The Presidential Campaign was now being fought. The Democracy of the South had raised the flag, "Annexation or Disunion." Democrats of the North who could not cheerfully fight under that flag, but who desired the election of Mr. POLK, inscribed on their banners, "All of Oregon or none; 54° 40′ or fight;" giving as reasons for that claim—(1) The treaty with Spain, the first discoverer, in 1819; (2) Capt. GREY'S discovery of the Columbia River in 1790; (3) the Louisiana purchase in 1803; (4) the exploration of the Columbia from mouth to source by LEWIS and CLARK in 1803; (5) settlement of Astoria in 1811; (6) Contiguity and continuity of settlement.

Mr. POLK was elected President, and in his first message to Congress (1845) declared our title to the whole of Oregon was "clear and indisputable," and intimated that unless it was conceded war would ensue. This official position, after the offer of latitude 49°, was a surprise to Great Britain and no further negotiations were offered. In a few months the President, thinking probably that the political fever had abated, caused the proposition to establish the line on 49° to be renewed. Britain again declined.

Up to this time the territory had been, by agreement, in the joint occupancy of the two Governments, subject to abrogation on twelve months' notice. Congress voted to give the notice. Soon after Britain intimated that if 49° was again offered it would be accepted. Mr. POLK, anxious to get himself out of the difficulty and to avoid the responsibility, consulted the Senate and promised to abide by its advice. The Senate said "settle," and the line was established to run on the 49th parallel "to the middle of the channel which separates the Continent from Vancouver's Island" and thence by the main channel to the ocean. This, it was hoped, settled the question forever. But when, in consequence of emigration and the projection of the Northern Pacific Railroad, Puget's Sound became of importance, it was a question of some moment which nation should hold and occupy the islands of the San Juan archipelago, as they command the entrance to the Sound. Whatever other faults the English Government may have, that of omitting to make claim to whatever it wants, is not one. The assertion was made that it was the intention of the treaty that this line, after leaving the 49th parallel, should follow the channel nearest the main land—although, in places, narrow, shallow and intricate—rather than as claimed by the United States, the one between the Islands Vancouver and San Juan which, beside being wide and deep, was the more direct.

The question was submitted for arbitration to King WILLIAM of Prussia, now Emperor of Germany, who decided that the claim made by the United States was just and valid, and the bounds were so determined.—[To be continued.



BEDOUIN LIFE IN SYRIA.

The Story-Teller.

WAS IT WORTH A LEG?

IT was in the autumn of the year 1782 that a surgeon in Boulogne, of the name of Etienne Lefebvre, received a letter, not bearing any signature, requesting him to repair on the following day to a country-house which was situated on the road leading to Calais, and to bring along such instruments as would be required for performing an operation. Lefebvre was at that period well known as a distinguished and successful operator; so much so, indeed, that he was not unfrequently sent for from great distances. He had served for a considerable time in the navy, and his manners had, therefore, acquired a certain degree of bluntness; but when you once became acquainted with him, you could not help liking him for the natural and unaffected goodness of his heart.

He was naturally somewhat surprised at this anonymous communication; for, although the time and place were, as already stated, mentioned with great minuteness, there was no clew afforded by which the writer could be identified. He, therefore, came to the conclusion that some of his jocular friends were making fun of him, and he did not keep the appointment.

Three days afterwards he again received a similar summons but couched in more pressing terms than the first, and he was informed that at nine o'clock in the morning a carriage would be sent to bring him to the place where he was anxiously expected. Accordingly next morning sure enough, on the last stroke of nine, a carriage drove up to his door. The doctor no longer made any hesitation, but at once took his seat in the carriage. As he was getting in, he inquired of the coachman where he was to be taken to; but the man appeared either not to know or did not choose to tell; but as he spoke in English, Lefebvre said to himself, "So it is an Englishman to whom I am summoned;" and he accordingly prepared himself for any exhibition of eccentricity on the part of one of that nation which even now is so little understood by Continentals. At length the carriage stopped and the doctor hastened into the house.

He was received at the entrance by a fine-looking young man of about twenty-five years of age, who requested him to walk into a large and handsome room on the first floor. His accent showed him to be an Englishman. The following conversation ensued between them:

"You have sent for me," said the doctor.

"I am very much obliged to you for the trouble you have taken in coming here," rejoined the Englishman. "Be so good as to seat yourself at table, where you will find chocolate, coffee or wine, in case you would like to partake of anything before commencing the operation."

"But first show me the patient. I wish to satisfy myself that an operation is absolutely necessary."

"It is necessary, Monsier Lefebvre; pray be seated. I have entire confidence in you; only listen to me. Here is a purse containing 100 guineas, which I offer you as a fee for the operation you are asked to perform, no matter what the result may be. In case of your refusing compliance with my request, you see this pistol, it is loaded, and you are

in my power. As I hope for salvation, I will blow your brains out!"

"Sir, I am not to be deterred from doing what I consider proper by any fear of your pistol. But what do you desire? What am I expected to do?"

"You must cut my right leg off."

"With all my heart," answered the surgeon, thinking that this was a characteristic specimen of those mad English; "and your hand also, if necessary or desirable. However, unless I am greatly mistaken, your leg is perfectly sound. I saw you walk down stairs with the greatest activity. What can be the matter with your leg?"

"Nothing; but it must come off."

"Sir, you are mad."

"That is no concern of yours, Monsieur Lefebvre."

"What harm can that handsome limb have done?"

"None at all; still, you must make up your mind to amputate it."

"Sir, I have no acquaintance with you; give me some proof that you are in sound mind," naturally demanded the doctor.

"Will you consent to my wishes, Monsieur Lefebvre?"

"As soon as you can assign any adequate or reasonable motive for so unnecessary an operation."

"I cannot at present enter into any explanations—in a year, perhaps, I will do so. But I will bet you, sir, that then you will acknowledge that my reasons for my present seemly extravagant conduct are most pure, manly and noble, and even rational."

"It is quite impossible for me," remonstrated the surgeon, "to comply until you tell me your name, place of residence, position and family."

"You shall be made acquainted with all these particulars at some future time, but not at present. I beg you to consider me a man of honor."

"A man of honor does not utter unjustifiable threats against his doctor. I have to perform a duty even towards you, who are a stranger to me. My reasons for refusing to accede to your absurd request are, as you must admit, sound and just. Do you wish to be the murderer of an innocent father of a large family?"

"Well, Monsieur Lefebvre," replied the Englishman, taking up the pistol, "I will not fire upon you, and yet I will compel you to cut off this leg. What you refuse to do to oblige me, through love of gain or fear of a bullet, you shall do through humanity."

"How so, sir?"

"I intend to shatter my leg with this pistol and that, too, before your eyes," answered the Englishman who accordingly seated himself, cocked the pistol and then took deliberate aim at his knee-joint.

Lefebvre rushed forward to prevent him, but the Englishman coolly exclaimed:

"Do not come near; if you do, I fire. Now only answer me this question:—Do you wish to prolong my suffering needlessly?"

"Sir, you are mad!" answered the doctor in despair; "but have your own way—I am ready to do as you wish."

Everything was ready for the operation. As soon as the surgeon took up his instruments the Englishman lighted his cigar and declared that he would smoke until the operation was concluded. He kept his word. The lifeless leg rested upon the floor, but the Englishman still smoked on. The operation had been performed in a most masterly manner and, thanks to Dr. Lefebvre's skill and attention, the patient soon became perfectly recovered although, of course, he had to be supplied with a wooden leg. He rewarded the surgeon, whom he had learned to esteem more and more every day; thanked him with tears in his eyes for the great obligation under which he had laid him, and in a short time started for England.

About two months after his patient's departure the surgeon received the following letter from England:

"Inclosed you will receive a token of my boundless gratitude—a bill of exchange on my banker in Paris for 6,500 francs. You have rendered me the happiest of men by ridding me of a limb which was an obstacle in the way of my happiness. Learn, then, the reason of what you termed my madness. You assured me that there could be no justifiable motive for so singular a mutilation. I offered you a wager and I think you were right in refusing it. After my second return from the East Indies, I became acquainted with Susan Black, the most accomplished and fascinating of women. I sought her hand in marriage. Her fortune and family were such as met with the entire approbation of my parents. As for me, I thought only of her charms. I was soon happy enough to gain her affections—a fact which she did not attempt to deny; but she, at the same time, firmly refused to become my wife. In vain did I beseech her to do so; in vain did her relations all second my desire. She was inflexible. For a long time I could not discover the reason of her opposition to a marriage which she herself confessed would make her happy; until, at last, one of her sisters revealed the fatal secret to me. Susan was a marvel of beauty, but she was so unfortunate as to have lost a leg, and she had consequently condemned herself to eternal celibacy. My resolution was quickly formed, and I determined to become like her. Thanks to you, my dear Lefebvre, my wishes were soon accomplished. I returned with my wooden leg to London. I hastened to gain information of Miss Black. The report had been spread, and I myself had taken care to write to my friends in England to the same effect, that I had had the misfortune to fracture my leg, and that amputation had been found absolutely necessary. Every one expressed the greatest concern at my misfortune. Susan fainted on the first occasion of presenting myself. She was for a long time inconsolable; but at length she consented to become my wife. It was only on the morning after our marriage that I confessed to her the sacrifice by means of which I had at length been enabled to gain her consent to be mine. The avowal increased her love. Oh! my excellent friend, had I ten legs to lose, I would give them all up for the sake of my beloved Susan. So long as I live, rely on my gratitude. If ever you visit England, do not fail to come here so that I may make you acquainted with my wife; and then tell me whether or not I was out of my senses. Yours faithfully,

"ARTHUR OXLEY."

Monsieur Lefebvre answered the letter of his English friend in the following terms:

"SIR:—Accept my best thanks for your very generous present—for so I must term what you have sent me—having been previously magnificently remunerated for my trouble, as you were pleased to term it. I wish you, as well as your charming wife, all imaginable happiness. True it is that to give a leg in exchange for a beautiful, tender, loving and virtuous wife, is not too much, provided the happiness endures. Adam sacrificed one of his ribs to become possessed of our common mother, Eve, and more than one man has laid down his life for the sake of his beloved. Notwithstanding all this, allow me to adhere to my former opinion. For the present you are doubtless right, for you are now in the honeymoon; but at some future time you will acknowledge the truth of what I advanced. I beg your attention to what I am about to say. I fear that in two years you will repent of having had your leg amputated above the knee-joint. You will think that to have it cut off lower down would have been quite sufficient. In three years you will be persuaded that the sacrifice of a foot would have answered all purposes; in four, that of the big toe; in five, the little one; and at last, you will have confessed to have parted with a nail, without necessity, would have been a piece of egregious folly. All this I assert without in the slightest degree impugning the merit of your admirable helpmete. In my own youthful days I would have, at any time, given my life for my mistress; but never my leg, for I should have feared repentance for the rest of my days. Had I really done so, I should have every moment said to myself, 'Lefebvre, you are a madman.' With highest consideration, yours very obediently,

"ETIENNE LEFEBVRE."

In the year 1793, during the Reign of Terror, the surgeon of Boulogne, having been accused of being an aristocrat by one of his younger professional brethren who envied him his practice, was obliged to take refuge in London, in order to save his neck from the guillotine. Being without employment or acquaintance, he inquired for the residence of his former patient, Mr. Oxley. He was directed to it and, on arriving at the house, he sent up his name and was immediately admitted. In a huge arm-chair, seated before the fire with a bottle of wine beside him, sat a portly personage, whose size was so great that it was with difficulty that he could rise to welcome his visitor. "Welcome, Monsieur Lefebvre!" exclaimed the huge Englishman. "Do not be offended at my receiving you in this manner, but my cursed wooden leg won't allow me to do anything. You have come no doubt, my friend, to see if in the long run you were not right."

"I am a fugitive seeking an asylum among you."

"You shall stay with me, for you are really a wise man. You will console me. Do you know, my dear Lefebvre, that, had it not been for this abominable wooden leg rendering me useless, I should by this time have been Admiral of the Blue. I spend my time in reading the newspapers, and in curses that I am tied here when everybody is up and doing. Remain here; you shall comfort me."

"Your charming wife can doubtless do that better than I can."

"Oh, as for that, no. Her wooden leg prevents her from gadding about and dancing; so she has, as a resource, given herself up to cards and scandal. There is no possibility of living alone with her; in other respects, she is a good-enough woman."

"What! was I right, then?" exclaimed the surgeon?"

"Oh, a thousand times, my dear Lefebvre; but say no more on that subject. I was an unutterable fool. If I had my leg back again I would not part with the paring of a single nail. Between ourselves, I must have been crazy; but keep that to yourself."—*English Magazine.*

THE POETRY OF THE THROTTLE.

NOT long ago an engineer brought his train to a stand at a little Massachusetts village where the passengers have five minutes for lunch. A lady came along the platform and said:—"The conductor tells me the train at the junction in P—— leaves fifteen minutes before our arrival. It is Saturday night, and is the last train. I have a very sick child in the car and no money for a hotel, and none for a private conveyance a long, long way into the country. What shall I do?"

"Well," said the engineer, "I wish I could tell you."

"Would it be possible for you to hurry a little?" said the anxious, tearful mother.

"No, madam; I have the time-table, and the rules say I must run by it."

She turned sorrowfully away, leaving the bronzed face of the engineer wet with tears. Presently she returned and said:

"Are you a Christian?"

"I trust I am," was the reply.

"Will you pray with me that the Lord may in some way delay the train at the junction?"

"Why, yes, I will pray with you, but I have not much faith."

Just then the conductor cried, "All aboard!" The poor woman hurried back to the deformed and sick child, and away went the train climbing the grade.

"Somehow," said the engineer, "everything worked like a charm. As I prayed, I couldn't help letting my engine out just a little. We hardly stopped at the first station, people got on and off with wonderful alacrity, the conductor's lantern was in the air a half minute and then away again. Once over the summit, it was dreadful easy to give her a little more, as I prayed, till she seemed to shoot through the air like an arrow. Somehow I couldn't hold her, knowing I had the road; and so we dashed up to the junction six minutes ahead of time."

There stood the other train and the conductor with the lantern on his arm. "Well," said he, "will you tell me what I waited here for? Somehow I felt I must await your coming to-night, but I didn't know why."

"I guess," said the brother conductor, "it is for this poor woman, with her sick and deformed child, dreadful anxious to get home this Saturday night." But the man on the engine and the grateful mother think they can tell why the train waited.

WHAT A CORRESPONDENT FOUND.

THE Hartford Times has one of the best hits on this peculiar class of Bohemians that has appeared in some time, so rich is the joke and so well known are the parties mentioned that it will bear repetition:

It is some time gone by since Adam Badeau, Grant's pupil, married one of two very charming sisters—both petite, pretty and wonderfully alike in form and feature, though there are three years' difference in their ages. Two chaps I wot of laid it out at lunch one day to sell another chap who is that not uncommon man who knows everything and to whom no news whatever can be told. So the confederates approached the omniscient Jenkins.

"Did you know that Badeau had married a very pretty girl, who is scarcely distinguishable from her equally pretty sister?"

"Oh, aw, yaas," says Jenkins, "it's the principal talk in fashionable circles";(Jenkins frequenting the "fashionable circles" about as freely as I visit the Sultan's seraglio.)

"But," continued the confederates, "did you know that the two sisters were nieces of Eugene Sue and that they were the originals of the orphan twins in 'The Wandering Jew,' Rose and Blanche?'

"Oh, yaas, I knew that, though I forgot how they are Sue's nieces—whether his brother married their mother, or their mother—confound it! I'll find out;" and he actually did—that is, came down next morning with a clear account of the precise relationship. He never "thought to think" that Sue's story opens in October, 1831; so, supposing Badeau's bride to have been only fifteen at the date of the story, those lovely twin orphans "who by a sweet maternal caprice had been called Rose and Blanche," would be a round sixty years old now. Worse yet, Jenkins, being the New York correspondent of a Paris journal, put Badeau's wife and her sister into good French as the genuine Rose and Blanche of Sue's romance; and, worser, it has come back and is now going the rounds of the press in good English in this country. I tell you the story that you may "think to think" before you print and help to pass around this particular sell.

MARVELS OF SKILL.

SOME marvels of human ingenuity may be seen at the London Scientific Exhibition. Thus, a machine loaned by Sir Wm. Armstrong, the great gunmaker, measures thickness up to the one thousandth part of an inch; another, on the same principle, to the one-millionth part. The delicate balance of Mr. Oerting carries 3,000 grains and turns distinctly with the one-thousandth part of a single grain. Among the historical implements is the chronometer, sent by the Royal United Service Institution, which was twice carried out by Capt. Cooke and again by Capt. Osligh in 1787. When the crew of the Bounty mutinied, this veteran timekeeper was carried to Pitcairn's Island by the mutineers and sold by Adams in 1808 to an American captain who touched there. He sold it in Chili, and in 1840 it was bought at Valparaiso by Sir Thomas Herbert, taken to China by him and finally brought back to England in the Blenheim.

"THERE must be classes!" Very true; but think how mysterious and often unaccountable it is, the lottery of life which gives this man the purple and fine linen, and sends to the other rags for garments and dogs for comforters.—*Vanity Fair.*

A BATTLE CRY.

BROTHERS! up to the breach,
For Christ's freedom and truth,
Let us act as we teach,
With the wisdom of age and the vigor of youth.
Heed not their cannon balls,
Ask not who stands or falls,
Grasp the sword
Of the Lord
And forward!

Brothers! strong in faith
That "the right will come right."
Never trouble at death,
Never think of thyself 'mid the roar of the fight.
Hark to the battle cry!
Sounding from yonder sky!
Grasp the sword
Of the Lord,
And forward!

Brothers! sing a loud psalm,
Our hope's not forlorn!
After storm comes the calm,
After darkness and twilight break forth the new morn.
Let the mad foe get madder,
Never quail! up the ladder?
Grasp the sword
Of the Lord,
And forward!

Brothers! up to the breach,
For Christ's freedom and truth,
If we live we shall teach,
With the strong faith of age and the bright hope of youth.
If we perish, then o'er us
Will ring the loud chorus;
Grasp the sword
Of the Lord,
And follow! [*Dr. Norman McLeod.*

NOTHING TO DO.

BY BELLE WAFFLE.

"How busy you girls always are and I *have* nothing to do; I wish I had something, though," and the beautiful head was leaned upon the small white hand in a way that told plainly of weariness and disgust. Weariness of God's best gifts, of wealth, beauty, talent; of home, friends, the pleasures of social life; and "nothing to do."

Ah! how many there are in the world with means and ability, with hearts ever longing for a something to fill and to satisfy, and—"nothing to do!" Thousands of their sisters

"Work, work, work,
Till the brain begins to swim;
And work, work, work,
Till their eyes are heavy and dim."

For bread to keep their souls within their bodies and clothes for a scanty covering. Yet they, in their luxury and finery, have "nothing to do."

Millions of little child-hands are reaching out to be lifted above want and degradation, vice and wretchedness. Millions of human souls are groping in darkness; are struggling, single-handed, against ignorance, wrong and temptation; are crying out for help and guidance into the light, into the straight paths of truth and wisdom, and —"Nothing to do."

"Nothing to do," when, work long and hard as we may, there is still so much waiting to be done, but to fritter away the Lord's time and bury His talent in the earth; living a libel against His grand law of activity and usefulness; rusting and decaying in nothingness when created to be polished and perfected by work, of hand, heart and soul.

Pitiable is the condition of those who strain every nerve in the race and yet ever see Work far ahead of them; of those upon whom burdens and duties come so thick and fast that the human machinery must give way beneath them; of those whose oodies cannot keep pace with their souls in life's conflict; but, may the Lord have mercy upon those who have "Nothing to do!"

THE LORD'S POCKET-BOOK.

"WHOSE pocket-book is that which you carry?" said a friend to a business man, as he drew a well-filled wallet from his pocket.

"Why, my own, of course. Whose else could it be?" was the prompt reply.

"To whom the pocket-book belongs depends on another question. If you belong to the Lord, I guess the purse is His also."

"Well," said the man, thoughtfully, "I hope I do belong to the Lord; but your remark throws a new light on this subject. It never impressed me before, as it does just now, that I am to carry and use this pocket-book, 'My pocket-book,' as the Lord directs. I must think this matter out, for I confess honestly I never have looked at it in the light in which you place it."—*Christian Giver.*

PEOPLE have generally three epochs in their confidence in man. In the first, they believe him to be everything that is good, and they are lavish with their friendship and confidence. In the next, they have had experience, which has smitten down their confidence, and they then have to be careful not to mistrust every one, and to put the worst construction on everything. Later in life they learn that the greater number of men have much more good in them than bad, and that when even there is cause to blame, there is more reason to pity than condemn; and then a spirit of confidence again awakens within them.—*Frederika Bremer.*

IT is only by labor that thought can be made healthy and only by thought that labor can be made happy, and the two cannot be separated with impunity.—*Ruskin.*

Ladies' Portfolio.

SUPPOSE.

He. Suppose,
Fadette, that I, instead of keeping tryst
With you to-night, had staid away to doze,
Or call upon Miss Brant, or play at whist—
Suppose?

She. Suppose
You had? Think you *I* should have cared? Indeed,
Ain't you a bit conceit—don't take my rose—
A gift to me. From whom? Well—Joseph Mead,
Suppose?

He. Suppose
It is? Then I'm to understand, Fadette—
If I must read your words as plainest prose—
My presence matters not to you—and—yet,
Suppose—

She. Suppose
You are to understand me so? You're free;
Do if you wish! And—oh! the river's froze;
What skating we shall have! To-morrow we—
That's Jose—

He. And Jose
Be hanged! It seems to me, Miss Lowe, that you
Are acting rather lightly; rumor goes
That he—but since I seem to bore, adieu!—

She. Suppose—

He. Suppose
We say good-night.

She. Good-night, sir, and *good-by!*

He. What does this mean, Fadette? Are you—

She. We'll close
This scene at once. My words are plain, sir, I
Suppose?

He. Compose
Yourself, Fadette.

She. My name, sir, is Miss Lowe!

He. Come, come, Fadette, do look beyond your nose,
And—

She. Here's your ring, sir!

He. I receive it, though
Suppose—

She. Suppose
You do, sir?—you—

He. Enough, Miss Lowe. Farewell!
'Tis best. I've been deceived in you, God knows!
Coquette! a heartless flirt! a haughty belle
Who chose—

She. Suppose—
Oh!—oh! let's part as friends! I *hate* you—there!

He. Fadette! why, sweet, in tears! This surely shows
You'll pardon me, a brute!

She. And—Frank—we'll ne'er
Suppose.

[T. H. Robertson, in Scribner's.

THE ART OF TALKING.

MADAME DE STAEL, we believe it was, who said that in France alone was the art of conversation understood. French women specially are brilliant talkers. The English are good listeners often, but heavy talkers. The Germans approach the French in the versatility of their conversation, but not in the magnetism, their faces giving all too little help to their tongues. Americans are free and lively talkers without having much of the real art of conversation. They are voluble rather than thoughtful, persistent rather than sympathetic, bent on having a hearing, rather than, as Bacon would say, "leading the dance" of conversation. The art of which we are writing is something far other than talking: it implies a mutual bond of interest between people, and as mutual willingness to receive as well as impart. So the man who insists on talking at you is voted a bore. The American definition of a bore betrays the great American weakness in this regard:—"A bore is one who insists on talking to you about himself, when you want to be talking to him about yourself." The very word conversation defines its meaning: it is an interchange. Dr. Johnson, who was an immense talker, knew little of the art of conversing. Yet he is the man who remarked, of an evening gathering, that there was much *talk* but no conversation, by which he probably meant that he was defrauded of the privilege of doing the talking by the persistent and general interchanges. Coleridge, likewise, was a brilliant and unparalleled talker in the higher meaning of the word, but good for nothing in a conversation, which implies the double duty of communicating and listening. Indeed, conversation might be defined as the art of intellectual magnetism, with a positive pole of address, and a negative pole of sympathetic attention. Only they possess the art who can keep a balance between them, and be equally good at talking and listening. Our parlors are full of wall-flowers idooming in painful quiet, but with nothing to contribute to the fund of conversation. And we have many vapid and ceaseless social lecturers who imagine their success in the art of conversation is in proportion as, by keeping their own tongues a-going they stop all the others; but people who can "give the occasion" to others and then draw out with their ears what they have started with their words—people too unselfish to be wholly silent and too modest to monopolise—for the lack of these our circles are either stupidly silent, or monotonously bored by the irrepressible sound of one voice.

Conversation suggests discourse about things rather than people. Here is another bane of social interchanges. They are too often on the lower level of that talk which finds its subject matter in persons. That is gossip. People who do not read or think must largely make people and neighborhood events the staple of their talk, but the bad habit obtains even among those who by culture have been fitted to make better use of their tongues. Gossip does not always indicate ignorance. It is to be feared it has become a fashion into which even intelligent people are drawn. But this kind of talk is neither edifying nor wise. If there were no worse results, it narrows the mind to shut up its view to neighborhood details. There is no excuse for it now. The world's gates all stand open. The papers bring all lands, all governments, all rising ideas, to our very doors. Books lead us into the liberty of the world, and the best of its doing and thinking. How much grander in your evening *vis-a-vis* to discuss popular education in Europe, than the toilet of your latest caller, or the *bonmot* of your waggish friend. And to do this will require no learning. Only a little recollection of what you read when lingering over your coffee.

There is one vice of our conversation against which we should be on our guard even more than against our empty and harmless gossip. It is a growing fondness for smartness. Tartness, repartee and satire are very good for an occasional seasoning; but like horse-radish and mustard they make a very poor dinner. They leave a bad taste in the mouth. As Bacon says:—"Certainly, he that hath a satirical vein, as he maketh others afraid of his wit, so he had need be afraid of others' memory." And for this excess of biting condiments the personal character of our talk gives the occasion.—*The Radical.*

FASHION NOTES.

CLOUD-TINTED silks are for evening wear.

CUFFS arranged in deep side pleatings are trimmed stylishly.

BASQUES with diagonal fronts are handsome models for autumn.

BLUES saddened with black is a pretty novelty in dress fabrics.

WIDE ruffles of hand embroidery are *comme il faut* for neck garniture.

GRENADINES and English bareges are fashionable for early fall wear.

EMBOSSED silk galoons are used as headings to flounces and wide ruffles.

LONG vests are popular; they are simulated by ruffles of lace, or embroidered bands.

THE flaring vest is made with lengthwise side pleatings of silk, nicely graduated in width.

BRIMS caught up in a jaunty manner form one of the novel attractions of the coaching hats.

THE incoming modes give promise of a large variety and considerable theatrical roseate tinge.

BANDS embroidered upon netting is the favorite garniture for white serge and mohair costumes.

THE latest fashion in bracelets is a gold bracelet, with the wearer's name in Byzantine letters.

A HANDSOME black silk dress, combined with rich velvet, cannot be rivaled for costly elegance.

THE present ruffle in expensive garments—one-fourth rich, three-fourths on the economical scale.

SIDE plealings of all kinds will be worn. This fashion of trimming is a favorite with young and old.

SEASONABLE fabrics are very acceptable; they include a handsome variety of qualities and patterns.

A HANDSOME striped serge, disposed with silver-gray serge—quite an inexpensive fashionable toilet.

SHOULDER draperies of the painted pereline style will doubtless become favorites with ladies of fashion.

COMBINATION toilets are still fashionable; the colors are very opposite, yet harmonious in expression.

SOME of the new suitings are very smooth, while other styles present the rough surface first introduced in camel's hair cloth.

EMBROIDERED toilets are introduced in the autumn *beau monde*. This fashion is popular for bridal outfit establishments.

THE headings of new fringes come deeper, and beneath can be distinctly seen the silk, which produces a novel and smiling effect.

PLAIN square apron overskirts are indorsed. The drapery is confined at the back, and extends nearly to the drag braid of the skirt.

A HANDSOME stone-colored mohair, combined with a positive navy blue, is very effective and quite *a la mode* for promenade wear.

ALL wool cashmere de beges of a chocolate color is considered the mode for children's toilets; the trimmings are bright tinted ribbon bows.

FRENCH chips, coarse straws, both white and black, tapering crowns, wide brims—in fact, a perfect coaching chapeau, takes the lead.

WHITE materials appear to be great favorites with the belles of Paris, and hence this style of dress will be favored by the *beau monde* of New York.

SILKS in dark shades are designed for street wear; the over-garment is made of white or cream-colored cloth, and garnished with ribbon bows of same shade as the skirt.

THE "Thyra" mantilla is formed with deep square sleeves; the back is cut with a curved seam, and hence slightly fits to the form. The front is disposed in long tabs, cut square, and finished with pretty pockets.

THE "Kellogg tread" is the latest. It broke out among the ladies at Saratoga when the *prima donna* was there, and is raging from Maine to California. When well done—as Miss Kellogg does it—it is graceful, dignified and stylish; but her imitators only make geese of themselves.

Reading for the Young.

PEOPLE WILL TALK.

You may get through the world, but 'twill be very slow,
If you listen to all that is said as you go;
You'll be worried, and fretted, and kept in a stew,
For meddlesome tongues must have something to do,
And people will talk.

If quiet and modest, you'll have it presumed
That your humble position is only assumed—
You're a wolf in sheep's clothing, or else you're a fool;
But don't get excited—keep perfectly cool,
For people will talk.

And then, if you show the least boldness of heart,
Or a slight inclination to take your own part,
They will call you an upstart, conceited and vain,
But keep straight ahead—don't stop to explain—
For people will talk.

If thread-bare your dress, and old-fashioned your hat,
Some one will surely take notice of that,
And hint rather strong that you can't pay your way,
But don't get excited, whatever they say—
For people will talk.

If your dress is in fashion, don't think to escape,
For they criticise then in a different shape;
You're ahead of your means, or your tailor's unpaid,
But mind your own business—there's naught to be made—
For people will talk.

Now, the best way to do is to do as you please;
For your mind if you have one, will then be at ease,
Of course you will meet with all sorts of abuse,
But don't think to stop them—it ain't any use—
For people will talk.

JUVENILE CULTURE.

THE youth of this country have attained a degree of perfection in refinement and culture surpassing perhaps that of any preceding age, unless it may be that in the century and a-half of Grecian liberty and intellectual progress Athenian youth attained a proportionate degree of improvement; but of this little or nothing is now known. This present progress is principally owing to one of the most distinguished privileges which Providence has conferred upon us—the attention of higher training and cultured mentors. And hence, it is not surprising that a generation of sappy sages are arising, equaling their fathers in wealth of conception and political lore, mounting the ladder of fame and essaying to promulgate to hoary age lessons of mutability and the transcendentalism of modern life; which sensibility, however, inveighs against with pious irony as a childish presumption, unknown in the days when they were young.

Among a nation like ours, so free, enlightened and acute, we may naturally expect to find the juvenile taste in no small measure polished and judicious in proportion to the culture of its surroundings; whereas, under arbitrary and execrable governments, it is perverted rather than enlightened. "Liberty," remarked LONGINUS, "is the nurse of true genius." "They," said PETRONIUS ARBITUS, "who are bred and educated amid the institutions of tyranny, can no more acquire a good taste than they can smell sweet who dwell perpetually in a kitchen." A republic like our own is indeed a sufficient school for true eloquence.

A conspicuous phenomenon of this remarkable age is its singular fruitfulness of juvenile genius. Four former periods of similar fruitfulness of genius, but not juvenile, have employed the speculations of curious men. The causes assigned for it have been various, and some of them passing strange. But whatever the reasons be, the fact is certain that nature is prodigious in her present productions of juvenile genius. And these geniuses' writings are as extensive and varied as the colors on the Dame's own garb. Political discussion, sermons, essays, anything, they will handle with as little consideration as a love story or a tale of "blood and thunder." And their genius always burns. Their combustion, by-the-by, is given gratis to their favorite paper, with a studied *nom de plume.*

And this leads me to observe that, as we are early sensible to a relish for light literature, we are often thus led into a passion for novels and "blood and thunder" trash, which results in a pernicious taste and a corrupted sensibility to false beauty. Hence it must be our object, when the glimmerings of taste appear, to apply ourselves to works of genius, to once see nature justly imitated, and the spurious productions of drivelers will not only never please but receive our merited contempt.

Therefore I would recommend to those young readers who have a relish only for dime novels and the "Battle Ax" and "Kill-many" weekly papers of their towns, to possess themselves of any of CHARLES DICKENS' works, say "The Old Curiosity Shop," "Dombey and Son" or "Pickwick," and see not only how much real pleasure but intuition in the human character and correctness of taste can be derived from it. Perhaps you would be thus led to read through the whole of his works, and a great benefit you would receive from them. Thence undoubtedly you would acquire an aversion for drivelers' trash, and pursue a noble course of reading.

Correctness of taste established, reason and good sense, refinement and virtue are the consequences which would immediately follow. Youth would rise in intellect and manliness, and become better qualified to make the powers which GOD has given them subservient to His glory

WILLIE C.

In a succeeding letter perhaps I will try and treat of the subject of juvenile writing and speaking at length, to inculcate, if possible, in my young readers some lessons for entering on writing in an interesting way.

MORE CENTENNIAL.

STARTED from home in a hurry, as usual, leaving my note-book and unfortunately not being blessed with so many pockets as a man, could not resort to their usual contents—old letters, cards, and circulars; so all I write must be fished from the confused remembrance of the brain. Northwest of the Government Building and west of Belmont Avenue is the row of State buildings, unique in design, each differing from the other. Having occasion to visit the Jersey building, we were tempted in the adjacent Colorado and Kansas display, which is in a roomy, well-lighted structure, the outside hung with skins that would tempt some of our civilized savages. Inside the exhibit of minerals, insects, birds and eggs first attracted our attention, and turning from there our eyes met those of a huge buffalo that, with head lowered, seemed ready to cause a stampede. The space devoted to Agriculture is well-filled. Fruit in good preservation, large, luscious and tempting; and while we stand by it, let me point out to you just the "cutest" ottoman you ever saw—made I judge from buffalo horns with the long hair forming a soft cushion, and falling in a fringe over the glossy legs. Think how nice it would be to bury your slippered feet in its depths some cool evening of the coming winter. In the center of the building is placed a pretty fountain, the inscription upon it reading, "Presented by the ladies of Topeka," and over it is suspended a mammoth bell made of wheat, the tongue being represented by a huge gourd, and even the crack in the old bell is depicted by, well, it looked like wheat.

Among the stuffed birds there is one case where the nest with the old and young bird is shown. There are some very handsome specimens of the owl family. We were particularly amused at the intelligent expression of two baby owls. But for their little crooked bills a body might tie a pink ribbon round their necks, and call them maltese kittens. Directly opposite you will find a crowd about the rocky, mountainous display, representing a very small slice of the country, over which evergreen trees are scattered, and through which a tiny cascade finds its way to the pool at the mouth of the cave. Gold and catfish were seeking stray sunbeams, the turtle perched on a rock, was placidly grinning at the audience. Among the rocks and on the trees are scattered the various animals of the country. From the deer and panther to the rat and owl all appear to be represented, and the work so well accomplished, speaks highly for the woman's hand that prepared it. The animals look almost as full of life as the pair of Antwerp pigeons peeping from behind the cage bars. These pigeons, as also a fine rifle, were recently presented to the famous huntress, Mrs. M. A. MAXWELL, and while gazing at that neat, little weapon I actually found it necessary to repeat the tenth commandment, while realizing "how near and yet so far."

In the adjoining parlor one can find abundant accommodation for rest and instruction. Opposite the fine piano stands an ancient bureau that was once in the family of Pres. Lincoln—I think was made for him about the time of his marriage, and is to be sold to the highest bidder. Near it is a large, handsome cabinet worthy a close, careful study—not only for the beautiful workmanship and woods that compose it, but for its contents also.

We went to the ancient New England kitchen, near by. When we reached the log house we found the gateway barred, and while waiting for the crowd to pass on, had ample time to admire the hollyhocks, sunflowers, etc., that adorned the front yard. Once inside, the first we noticed was the lady spinning on the flax wheel, while near it stood a larger one for wool. Claw-footed tables, uncomfortable, high-backed chairs and "settles," over which were flung ancient fabrics of home manufacture, from the fine, snowy linen to the coarse, heavy carpeting, abounded. The fire-place, with crane and cooking utensils complete, occupies a large part of one side, while suspended in front by a stout cord swings a plump chicken that looks as if it had been roasting before a slow fire for the past century. On each side of the fire-place are hung cases for receiving numerous articles like knives, forks, spoons, quills, etc., while interspersed were all the queer dishes one ever saw or heard of in those times. Side by side in the chimney corner rest the foot stove and churn. Back flashed my thoughts to a sunny New England kitchen where a sun-burned little gypsy clutched desperately the tall dasher, occasionally giving a downward stroke that sent the cream in golden patches upon the snowy floor, accompanying the action with the delightful melody, "Come, butter, come!" Just through the open door were the birds and bright-winged butterflies—the mountain, green fields and orchard, with rippling stream that ran on, on to Fairy Land. Did little girls have to churn there, and did it make them ache so—ache to be away out in pure, blossom-scented air, among the birds and squirrels in the nodding cherry tree and swaying high up its limbs back and forth in the long swing?

One of the pair of cards used for carding wool into rolls, passing across my hand, dispelled the day dream, and brought my thoughts back to objects before me. The broad mantel is covered with articles too numerous to give more than a passing mention. Many would puzzle a philosopher to ascertain the use of. Candlesticks of every design; snuffers; box and and tinder; pewter dishes of every style; some dingy and show-

ing the marks of usage, others polished to the brightness of new silver, form quite handsome ornaments for the tall "chist o' drawers." On the opposite side of the fire-place is the cupboard used for dishes, some of which are displayed on the table. Suspended half across the fire-place was what I took to be the real Yankee doughnuts, but closer inspection proved them apples dried whole, with the core removed. Strings of sliced apples and pumpkin, mingled with every "yarb" you could mention in use at that time, ornamented the ceiling. There is more to tell you, but will wait till next time. C. ESTELLE PEIRCE.

Aquadale.

LETTERS FROM BOYS AND GIRLS.

From a New Source.

DEAR RURAL:—I have just been reading the letters from the boys and girls, and not seeing any from New Market, I thought I would try and see what I could do. I have attempted several times before, but this is the first time I have succeeded. I am boarding at New Market, and we think of staying here until October. I am very fond of flowers, and wish the Cousins would write more about them. We go to the woods very often to gather ferns or grasses, and often I find many pretty wild flowers which I would like to learn the names of. I am thirteen. During the winter I reside in Brooklyn, L. I., and also attend school there. Hoping you will receive me as a Cousin and print my first letter, I will close.—FLOY, *New Market, N. J.*

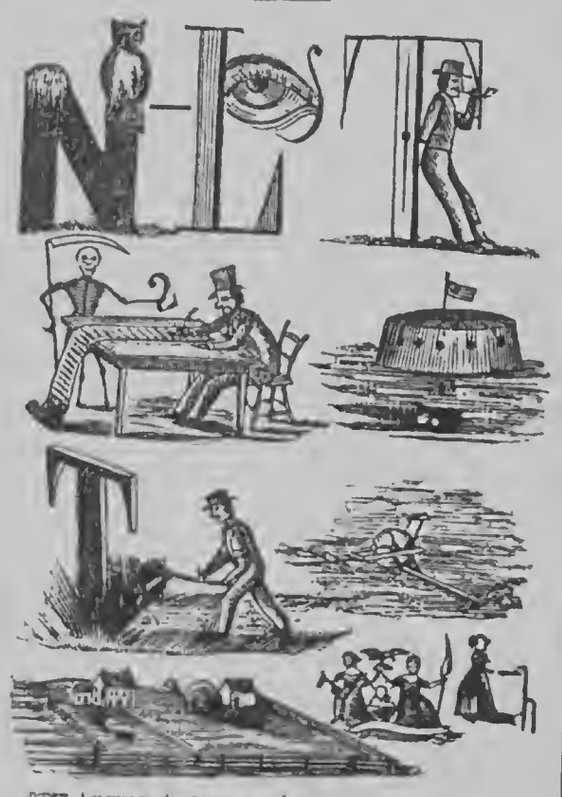
Don't Like It.

DEAR EDITOR:—JOE STEELE wants the Cousins to tell him what they think of the pretty parlor amusement, in RURAL, Sept. 9. I for one don't like it, because I think it comes too near swindling and cheating. My father says it isn't right to take money without giving something or doing something for it,—"*quid pro quo*," he calls it,—unless somebody gives it to you right out as a present. I should think any boy that would take five cents in such a way would feel mean when he came to think about it. It is just like grab bags and lotteries at fairs, only maybe worse—for you wouldn't do it if you didn't think the chances were all on your side. I would as soon pitch pennies for keeps as to do it. And don't you think, Mr. Editor, that a boy who begins in this way is in danger of being a gambler when he grows up?—BEN.

[WE think BEN is right. If a boy tries to be fair and honest, he will get good habits. Money that is gained in dishonest or underhand ways is often a curse to its possessor.—ED.]

The Puzzler.

ILLUSTRATED REBUS.



☞ Answer in two weeks. G. B. H.

MISCELLANEOUS ENIGMA.

I AM composed of 17 letters:
My 10, 11, 7, 5 is used in printing.
My 12, 13, 9, 16, 10, 13, 14 a river of New Jersey.
My 3, 2, 16, 10, 8, 12, 15 an artificial well.
My 6, 2, 1, 4 a young girl's title.
My 10, 5, 9, 12, 13 the Latin for earth.
My 8, 17, 3, 13, 7, 5 is to get away.
My whole is the motto of a Southern State.
☞ Answer in two weeks. ISOLA.

CENTRAL PUZZLE.

1. A NUMBER. 2. Sorrow. 3. Quickness. 4. A sweetmeat. 5. A weight. 6. To forsake. Words of five letters. The centrals form a large city of Europe.

☞ Answer in two weeks. BERBIX.

PUZZLER ANSWERS.—Sept. 16.

BIBLICAL ENIGMA.—"Blessed are the pure in heart, for they shall see God."

CROSS-WORD ENIGMA.—Bible.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

THE following is a graduated scale of prices for small clubs according to the roduced rates of subscription for the RURAL NEW-YORKER. This is done for the benefit of the small clubs in thinly-populated districts. Let each subscriber add two or three names to his own and remit for all at one time.

No.	Single Price.	Small Clubs.	No.	Single Price.	Small Clubs.
1	$2.50	$2 50	6	$15 00	$13 20
2	5 00	4 90	7	17 50	16 05
3	7 50	7 20	8	20 00	16 80
4	10 00	9 20	9	22 50	18 45
5	12 50	11 25	10	25 00	20 00

News of the Week.

HELL GATE EXPLOSION.

THE work at Hallet's Point was consummated on Sunday the 24th inst at 2:50 P. M. At the appointed moment the mine was fired. An immense number of persons thronged every available point of observation. The calculations of Gen. Newton proved correct, and the explosion caused no loss of life or property. There was no tidal wave, and only a slight disturbance of the atmosphere. The vibration of the earth, though very generally felt throughout the vicinity, was not sufficient even to excite alarm. The water, rocks and planking thrown into the air by the explosion fell vertically again into the river, and the local disturbance of the surrounding water quickly subsided. The prominence which had been given to the possibilities of danger led to a very general adoption of Gen. Newton's suggestions. The windows of buildings were left open throughout the upper part of Manhattan Island and on Long Island near Hallett's Point, and many persons, even at a considerable distance from the scene, remained in the streets or parks for safety. The explosion is asserted to have been entirely successful in breaking up the reef, and the depth of water near the shore is already much increased.

At 2:20 P. M., half an hour before the blast, a gun was fired from the Government scow, to give notice to all. Vessels had ceased to pass the Point about 1:30, the Pleasant Valley being the last to go by, as she steamed up the river to her position, just a little above the firing point. Ten minutes before the explosion another gun sounded its warning, and at the same time Mrs. Gen. Newton arrived at the firing point, accompanied by a nurse who carried in her arms little Mary Newton, two years and four months old—a pretty little child with blue eyes, fair skin, and light curly hair. The baby-girl looked around upon all with perfect self-possession, while the party passed into the shed—which was constructed without sides, that the view might not be obstructed—and took their places. Two or three minutes later Gen. Newton came from the bomb-proof with Gen. Abbot, Capt. Mercur, Mr. Striedinger and others. The officers and civilians stood outside the shed and close at hand, while Gen. Newton frequently consulted his watch as he talked in a pleasant way with Mrs. Newton and his staff. Not a line in his face betrayed the slightest anxiety. Twice he turned to his little daughter, whom the nurse held in her arms, patted her cheek and taking her hand in his, touched with it the keys which was to give the finishing stroke to the great mine. As he did this the eye involuntarily turned to the mine, but the battery plates were still out of the acids and consequently the touch was harmless.

After looking at his watch again, he said, "Come my little girl," and lifting her from the nurse's arms stood her by the side of the keyboard upon a box placed there for the purpose. Once more he took the child's hand and held it with his right hand immediately over the key, the spectators looking on in breathless suspense, mingled with a feeling of awe, at the thought of what that little hand would soon accomplish. Gen. Newton stood with his open watch in his left hand and his child's hand in his own. Silently he watched the seconds pass. At length he shut his watch and returned it to his pocket, said something to Mrs. Newton, which was inaudible to persons outside of the little shed, and pressed the little hand of his child upon the key.

The result was just what he had confidently asserted weeks ago that it would be. A column of water was seen to shoot up to the right apparently of 75 or 80 feet, carrying a part of that distance a few stones of small size and several portions or sections of the coffer dam. The report followed instantly, and, at the firing station, was not so loud as that caused by the discharge of two or three pieces of ordnance, while the jar was no greater than that felt from such a discharge at the distance, say, of 100 feet. The commotion of the water was great for a few minutes, and the earth of which the coffer dam was partially composed made it very muddy, while pieces of timber and boards were thrown over and over on its surface in such a manner as to show how greatly the element was stirred. More than 50,000 pounds of powerful explosives had been fired. As soon as possible Gen. Newton boarded the launch, leaving Mrs. Newton to follow on the Star, and started for the scene of his triumph. Before he left the firing station with his staff many friends pressed forward to congratulate him and them upon the success of their labors.

HOME NEWS PARAGRAPHS.

THE Auburn, Me., shoe factories are running on full time, and to the extent of their capacity. Orders are coming in faster than they can be filled. The shipments the past week have been 1,877 cases.

A dispatch from Los Angeles narrates a terrible case of suffering on the Colorado desert. Henry Smith from St. Louis, with one companion and a pack train left Yuma for Los Angeles and wandered four days in the desert without water. Smith opened a vein in his arm and drank his own blood which clotted in his throat. He then cut his windpipe to remove it, and died in a few hours. His companion reached the station in the last stages of exhaustion.

It is certain that negotiations are pending for a new treaty with Great Britain, which will be chiefly devoted to extradition. It is understood that the initial steps have been taken by Great Britain. It is safe to say that in any new treaty which may be submitted, Great Britain will be bound to place United States officials upon the same footing with her own. This has not been the case under the treaty which is now abandoned.

The wheat export movement at San Francisco since the opening of the season has been quite lively. There were twenty cargoes of wheat and one of flour cleared for Europe in July, and twenty-eight cargoes of wheat for the same destination in August.

The steamship Rebecca Clyde, which is now ashore, sailed from Wilmington, N. C., loaded with naval stores and cotton. She became disabled off Ocracoke Inlet, 20 miles south of Hatteras, on Sunday morning about 7 o'clock, from the rolling of the deck load which broke the steering gear, the lashings of the deck load becoming entangled in the propeller. She became a total wreck and more than half the crew were saved.

Two-thirds of the willow for the manufacture of willow-ware in this country is imported from Europe at a cost of $5,000,000. The cultivation of the willow is contemplated by some Americans, they thinking that by cultivating superior grades of the basket willow they can make a profit per acre of $150. A manufacturer asserts that fully 5,000 articles are constructed from willow shoots—chairs, sofas, and baskets being the most common.

The Tribune says: the managers of the New York State Fair lost money this year, and men who bought the privelege of selling certain articles were not repaid for their ventures. The chief cause of the loss was the placing of the admission fee at 50 cents. Hundreds of farmers who had come with their teams many miles, refused to pay the price demanded and returned home. On the last day the price was reduced to 25 cents, but this action was too late to be of much benefit. We are inclined to think however, that the two real causes were the Centennial and the bad weather, and not the price of admission.

An immense iron pavilion will soon be erected in Boston, in which to hold the revival meetings of Messrs. Moody and Sankey during their approaching visit to the city.

The people of Sufferns, N. Y., witnessed a remarkable golden wedding several days ago. James Suffern, who was married to Maria Winter on Sept. 9, 1826, by the Rev. Jefferson Wynkoop, was remarried by the same clergyman on the fiftieth anniversary, Sept. 9, 1876. The bridesmaid and groomsman of 1826 also were present and served.

A Herkimer County tailor who started out to go fishing in 1813 got back one day last week; but he didn't bring home any fish.

The sidewalks in front of the leading stores in this city are blocked up with merchandise awaiting shipment, which affords evidence that New York is still the great jobbing centre of the country. The near-by trade has also begun to show symptoms of improvement.

A lot of Canadian-bred horses recently sold to great advantage in England. They were shipped from this city in a steamship having a patent apparatus which economizee room on shipboard, and ensures the safety of the animals. The freight was $50 a head. The animals were all warrented to drive or ride. The average price in Canada was $125, and the average selling price $275.

Lucy Manks, the murderess, is working out her line of defence. The Lowell, Mass., Courrier says she "held her head bowed down while in the court room, and seemed much dispirited," and everybody who saw the young woman hold her head down and look blue, concluded she was crazy, and about two years from now she may be shooting another man.

As Goldsmith Maid had already done the swiftest trotting on record, the attempt to force her this year to faster time scarcely deserved success. She has attained an age that would fairly entitle her to rest upon her laurels. Does Mr. Bergh ever go on the trotting track?

The readiness with which bids are made at the large trade sales in this city has been already remarked as indicating a recovery from business depression. This was further illustrated in the last auction sales of carpets and hosiery, at which good prices were easily obtained. Of late there has been hardly wind enough to blow that straw by which the direction is indicated. There seems to be hope that merchants can now raise the wind.

Another periodical proposition has been made for the reorganization of the Erie Railway. This time it is a call upon bond and stockholders for a per cent. contribution. Don't you wish you may get it?

Duncan, Sherman & Co., the bankers, who failed sometime since, have applied for a discharge. Do they want more widows' and orphans' money with which to pay personal expenses of $150,000 per year?

A train on the Utah Road was boarded by masked men and the express safe was robbed of $15,000.

Robert Barnwell Rhett, Sr., died in St. James Parish, La., recently, at the age of seventy-five.

A recent count of Red Cloud Agency shows only 4,900 Indians, where there should be 13,000. Other agencies show similar figures. Gone to meet Sitting Bull.

The Bankers' Convention will meet on Oct. 3 in Philadelphia to complete the organization of the American Bankers' Association. Ex-Secretary Hugh McCulloch will be one of the lions of the occasion.

The old South Church, Boston, has been sold for $400,000. It will be used as a museum.

It is estimated by Treasury officials that the National Banks will replace at least seventy-five of the one hundred millions of six and five per cent. bonds, held as security for their circulation, with four and a-half per cent. bonds. The demand for the new bonds is increasing daily, the desire being to possess them before the premium increases.

It costs two cents to bring a bushel of wheat from the lakes to this city.

On Friday the 1st, 3000 Connecticut troops and their friends went over the Pennsylvania Railroad to the Centennial. On Tuesday the lightning express from Pittsburg to Philadelphia had 101 cars drawn by eleven engines in as many sections. The cars contained 5010 passengers. The entire train run through a distance of 355 miles in ten hours, making only two stops—on schedule time. This feat has not a parrallel in the history of railroading. On Wednesday this road carried 10,540 passengers out of the Jersey City depot between 7:30 and 10:30 A. M., to the Centennial. On Thursday 24,000 passengers, occupying 401 cars, were carried by this line from New York to Philadelphia. On Monday the New York, New Haven and Hartford Railroads gave the Pennsylvania Railroad ninety-nine car loads, or 5394 passengers. During the week 22,000 visitors from Connecticut alone went over the Pennsylvania Railroad to Philadelphia and return. To carry these sixty trains were run daily each way, many of them running through without a stop in two and a quarter hours. The same number will be run this week for the accommodation of the visitors from Mass., and the East.

As far as ascertained, the losses by the late fires on Frederick and Baltimore streets, Baltimore, Md., will foot up a little short of three hundred thousand dollars.

A strange and fatal disease has broken out among the cattle in Wayne County, Pa., causing much alarm. The cattle are infested by a singular tick which bores deep into the flesh of the creature. Inflammation sets in, and death follows in a few hours. Some thirty head have died at Hawley.

The rifle teams who participated in the international contest, with the exception of the Canadian team, who have returned home, had an informal reception in the judges' pavilion on the Centennial grounds Sept. 23. President Grant, Secretary Fish, Colonel Sanford, of the British Commission, and George W. Childs, of Philadelphia, were present. The riflemen were introduced to the President by General Hawley.

FOREIGN NOTES.

THE Princess Constance Bonaparte, daughter of Lucien, Prince of Canino, and a nun of the Sacred Heart, has just died at Rome.

Within three months cholera has carried off nearly twelve thousand people in the city and suburbs of Damascus. Most of the victims have been Mohammedans.

Windsor Castle was struck by a thunderbolt during a thunder-storm unaccompanied by rain, Sept. 7, and a portion of the stone parapet was knocked off. As the thunderbolt burst it threw out a shower of sparks, and resembled a shell exploding. There was great fear shown by the inmates of the castle for some time after the explosion.

A Spanish capitalist advocates the connection of Africa and Europe by a tunnel under the Straits of Gibraltar. He desires to obtain for the enterprise $20,000,000, and says that, with this tunnel and the one between Calais and Dover completed, the railroad companies might soon be advertising that they would take passengers from London to Calcutta "without change of cars."

The Correspondencia states that Dorregaray, the Carlist leader, will shortly come to Madrid to solicit pardon and recognize King Alfonso. Ex-Queen Isabella is expected in Madrid soon.

A fine lot of Canadian-bred horses were recently sold to great advantage in England where they are reckoned better suited to the market than those of Kentucky. They were shipped on the Guion Line of this city, in a patent apparatus which economizes room on shipboard, and ensures the safety of the animals. The cost was $50 a head. The animals were all warranted to drive or ride. The average price in Canada was $125, and the average selling price $275.

The Geographical Congress at Brussels decided to form an international association for exploring Africa and suppressing slavery.

Russia has abolished the separate administration for Poland.

A writer in the International Review says a Frenchman, Jean Gautherin, once an illiterate

shepherd and a poor workman, has become a sculptor of some eminence. The French Government bought his "St. Sebastian" for 14,000 francs. He carved the whole statue in marble himself, with the living model before him. Sculptors generally only work in clay, or at most give finishing touches to the marble which has been prepared for them by the workmen.

At a banquet given in Paris to the French labor delegates upon their return from the Philadelphia Exhibition, one of them said:—"In the great American republic, so lauded by our public men, we found the relative position of employer and workman the same as it is here. There, as in France, capital is the master. The workmen in America have every possible liberty; they have many more schools than we have in France; but, notwithstanding all this, and in spite of the abolition of negro slavery, the slavery of the whites still flourishes. Many as are the privileges which the workman is accorded, and which he does not possess in Europe, he remains a workman still; and these privileges are of little use to him as long as he is not allowed to have a share in the profits with his employer."

Allemany, an employee of the Bank of France, has been condemned in Paris to ten years' imprisonment for circulating old bills that had been withdrawn. Frauds to the extent of 172,000 francs were proved. A part had been appropriated to paying debts, but the greater portion was lost in stocks.

Fifteen million nine hundred thousand hectolitres of barley (420,046,200 gallons) are consumed annually in Germany for beer brewing.

Paris, it seems, has steam street cars that don't frighten the horses, run ten miles an hour, seat forty persons, can be stopped within five feet by a brake, turn sharp corners, and cost but $4 a day for fuel and attendance.

A troupe of Sioux Indians are exhibiting themselves in London.

The French steam-ship arrived at Havana Sept. 23, from Mexico, bringing advices to the 13th inst. The City of Zacatecas was captured on the 24th of August by Garcia de la Cadena, at the head of 1,500 insurrectionists. The same night he turned the city over to the American, German, and Spanish Consuls and evacuated it. The Government troops reoccupied the place on the 28th, having previously defeated Cadenas' bands. The change of ministry causes great satisfaction to the supporters of the Government. All the indications favor the final triumph of Lerdo de Tejada in the Presidential contest.

The new French iron-clad, the Redoubtable, which was launched at l'Orient, on the west coast, on the 18th inst., will be the most powerful war vessel possessed by the Republic.

INQUIRIES FOR ADVERTISERS.

[Owing to the many inquiries from subscribers concerning things that have a commercial value, and are offered for sale through the medium of newspaper advertising, we have deemed it for the best interest of all concerned, to classify our "Answers to Correspondents," so that each inquiry will appear under its appropriate head, either in "Inquiries for advertisers," or "Answers to Correspondents." This, we believe, will enable advertisers to more effectually comprehend the wants of our subscribers, and will enable us to make our advertising columns what they should be—a true reflection of our readers' wants. This department will be edited carefully, it being our aim to use it in the interest of both advertisers and readers (and we shall not hesitate to give our reasons for excluding bad or doubtful advertisements) and such other matter as will be of legitimate interest. At the same time it must be understood that such inquiries as may appear must appeal to the advertiser himself for answer. The advertisement should answer the want and the want is indicative of its need.]

S. Y., Delaware Co., N. Y., is referred to advertisement of "Prindle Steamer" on page 226.

M. T. H., Essex Co., Mass., is referred to advertisement of "Country Home" on page 227.

Mrs. M. P. Aldrich, Rathbone, N. Y., wants to know where Baker's Excelsior Cream Strainer is to be obtained, and the price.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 23, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	84,028	Molasses	—
Whisky	2,802	Rice, bbls	1,071
Corn meal, bbls	2,332	Cut meats, pkgs	8,153
Corn meal, bags	910	Lard, pkgs	5,819
Wheat, bush	224,388	Tobacco, hhds	2,081
Corn, bush	910,217	do. pkgs	4,370
Oats, bush	317,539	Butter, pkgs	41,380
Rye, bush	47,375	Cheese, bxs	75,717
Malt, bush	7,380	Cotton, bales	15,373
Barley, bush	51,20	Rosin	10,422
Beans, bbls		Spts. turp., bbls	2,077
Grass seed, bush	8,248	Dried Fruits, pkgs	1,412
Beef, pkgs	871	Eggs, bbls	6,692
Wool, bales	1,859	Peanuts, bags	—
Hops, bales	938	Leather, sides	54,025
Pork, bbls	1,903	Sugar, hhds	—
Tallow	1,466	Oil cake	8,178

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible: mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEANS AND PEAS.—Exports of beans past week, 951 bbls.; since Jan. 1st, 16,665 do.; same time last year, 1,400 do. Exports of peas past week, 25,178 bu.; since Jan. 1st, 477,330 do.; same time last year, 287,744. The market for mediums is somewhat undecided. Some holders put great stress upon the light crop, and are holding others to supply what demand comes along. The buying feeling, however, is not large. In marrows the demand continues good, and prime hand-cured new or well-kept old are firm at the extreme. Of other sorts the stock does not show much collection. Canadian peas easier for bulk; barrels unchanged; new Southern E. E. peas have sold at $4; but it is not likely the price will be repeated.

Beans—New pea, $1.55@1.60; medium, $1.40; marrow, $2; old prime pea, $1.50@1.55; fair to good, $1.30@1.40; prime mediums, $1.40@1.45; fair to good, $1.30@1.15; prime marrows, $1.95@2.05; fair to good, $1.15@1.80; prime white kid., $1.65@1.70; other, 1.25@1.50; prime red kidney, $1.70@1.75; other, $1.40@1.50; Lima (Cal.) $2.75@3. Black beans, $3.25@3.50. Canadian peas, bulk and bond, 95@96c.; free bbls, $1.14. Green peas, $1.15@1.20; split do. $5.

BEESWAX.—A small trade only in progress on export account; quoted at 31@33c. for Western and Southern.

BROOM CORN.—Small lots of new have been received, which are held as follows:—Texas, Kansas and Ohio range from 4 to 7½c, as to grade, with some light new green Texas offered at 4c.

BUTTER.—Supplies have come forward unusually free, but not for the moment much ahead of the wants of trade. Enlarged receipts of State give buyers better means of selection than they have had for some time and with a good retail trade sales are quite liberal in lots. There is a marked increase of trade with hotels and restaurants this season owing to the influx of strangers to and from the Centennial. Western is active for export and home use. Another cause is advanced for the large European want. It seems that Oleomargarine is becoming unpopular in Great Britain; in fact some points means are being taken to prevent its sale. We quote prices generally higher, but the tone will probably not be so strong after buyers have obtained a supply of stock they have been so long short of.

Export of butter past week 11,334 packages.

We quote:—Choice pails, 31@33c.; prime, 29@30c.; poor to good, 22@26c.; creamery pails, choice, 35@37c.; good, 33@34c.; sweet cream pails, 28@35c. State firkins, choice, 30@32c.; fair to good, 25@29c.; do. half firkin tubs, choice, 31@33c.; fair to prime, 27@30c.; do. Welsh tubs, choice, 29@31c.; other, 24@28c.; Western creamery, choice, 33@35c.; other, 30@32c.; do. firkins, best, 22@24c.; other, 17@20c.; dairy tubs, choice, 26@28c.; other, 18@23c.; factory choice, 23@25c.; other, 17@19c.

State dairies quotable at 29@32c.

CHEESE.—Exports light, 39,035 boxes for the week. The market has been completely upset this week. The full rates at the country sales led to strong views here among receivers of the choicest factories, and they were holding up to 12½@13c., these figures have rarely been met, and 12½c. has more nearly represented the market. Exporters have been indifferent and the principal operators holding off. On grades under fancy the closing market is decidedly weak; there are nearly if not quite fine obtained at 12c, and some very good lots at 11c. We quote:

Fancy factory, 12½@12¾c., fine, 12@12½c.; good and prime, 11@12c.; fair, 10@11c.; State farm dairy, fancy, 11½@11¾c.; good to prime, 10@11c.; fair and good, 9@10c. Western factory, good and prime, 9¾@10¼c., fair lots, 8½@9½c.; do. cheddar, choice, 11¼c.; do. flat, choice, 11@11½c.

CIDER.—Slow at 8c. Quality is always more or less against earliest pressings.

COTTON.—The market has been depressed and dull with liberal arrivals of new at the ports.

The latest quotations are:—September, 11 5-16@11 11-32c.; October, 11¼@11 13-32c.; November, 11¼@11 9-32c.; December, 11 5-16@11 11-32c.; January, 11 7-16@11 25-32c.; February, 11¾@11 21-32c.; March, 11 13-16@11 27-32c.; April, 11 31-32@12c.; May, 12 5-32@12 3-16c.; June, 12 5-16@12 11-32c.; July, 12 15-32@12¾c. August, 12 19-32@12¾c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9 7-16	9 7-16	9 7-16	9 7-16

Stained.

Good ordinary	9 3-16	Low middling	10 3-16
Strict ordinary	9 13-16	Middling	10 9-16

DRIED FRUITS.—The arrivals of new apples are still chiefly of inferior grades, not wanted by either shippers or the home trade, and they are pressed off at easier prices. Peeled peaches are quiet; small lots of new Georgia have been placed at 11c. Blackberries are scarce and at firmer prices, as well as cherries and raspberries.

Apples—State, sliced, 6¾@7¼c.; do., quarters, 6¾@7c.; Southern sliced, new, 5c.; choice do. at 7c.; do., new quarters at 4¾@6c. Blackberries, 8¾@8¾c. Peeled peaches, new, nominally 13@14¼c.; unpeeled peaches, new, nominal. Plums at 13@15c. Raspberries, 25@26c. Cherries, 16¾@17c.

EGGS.—Every day since our last has shown some improvement, but at the close prices are something in buyers' favor. Western are of good quality, which helps sales. Limed would be probably worth 21@22c. for State; 20@21c. for Western.

Near points, 23@26c.; State and Penn., 22@24c.; Western, prime, 22@23c.; do. other, 21@23c.; Canadian, 23@24c.

ESSENTIAL OILS.—Our recently revised quotations show the low rule that attends the large yield of all varieties. The quantity is intensified by the comparatively light business, without favored exception

Oil peppermint, glass, $3.75; do. tin, $2.90; spearmint, glass, $3.50; do. tin, $2.75; wintergreen, $2.80; sassafras, 3c.

We quote:—Peppermint, $2@2.25 ₩ lb.; Wintergreen, $2.50; Pennyroyal down to, $1; Sassafras, 40@42½c.

FEATHERS.—The supply is reduced, but there does not seem to be any large want unfilled. We quote live Western prime, 56@58c.; mixed, 35@45c.

FERTILIZERS.—The following are the first-hand prices of the leading sorts:

Ground Bone, $27@30 ₩ ton; Superphosphate of Lime, $37.50; Peruvian Guano, $56; Poudrette, $22.50.

FLOUR.—Exporters have bought freely and there has also been a good trade demand, with prices higher and strong.

For poor to very choice superfine State, $4.25@4.80; $5.00@5.10 for very common to fair extra do.; $5.15@5.25 for good extra do.; $5.30@5.50 for fancy do., and $5.55@6.50 for very choice extra; $4.25@4.90 for superfine Michigan Indiana Iowa, &c.; $5.00@5.10 for shipping extra do., the inside price for interior, and $5.15@5.50 for choice to very fancy extra do.; good to choice white wheat extras at $5.55@6.50; fancy do. $6.55@7.75; winter wheat, good to choice family city mill extras, $5.00@7.50; round-hoop Ohio, $5.00@5.10, and trade brands of do. at $5.15@6.75; St. Louis, $5.10@6.30 for common to fair extra, and $6.35@8.50 for good to very choice; Minnesota "straight" at $5.90@8.00, and patent at $7.00@10.00; unsound stock at from $3.00@3.75; city mill extra for West Indies at $6.00@6.25; do. English brands, $5.00@5.10; do. trade and family brands, $6.50@8.50; No. 2 at $3.10@4.00. Corn meal—Yellow Western, Jersey and Pennsylvania, $2.65@2.90; Brandywine, $3.25@3.30.

FRESH FRUITS.—The market is low for apples. A good deal of common fruit is offering. Only choice, sound State will bring $2. Bartlett pears are becoming scarce. Other fine table goods have a place in consequence. Peaches may be said to be over, so far as anything fine can be spoken of. Fancy plums have about run out. There is an abundance of Damsons or small blue which pass for them. Cranberries are now quotable. Grapes are abundant. Dried do not rally from the late low prices. Peanuts are firm, with a light supply. We quote:

Apples, 20-ounce Pippins, Oct. Red and Blush, ₩ bbl., $1.75@2; mixed, good, $1.50@1.75; best river, $1.25@1.37; common open heads, wind falls, 50c.@$1. Pears, Barletts, choice, ₩ bbl., $8@10; other, $5@8; Seckel, $4.50@7.50; Louise Bonne, $6@6; Flemish Beauty, $4@7; cooking, $2@3. Peaches, ₩ basket, best, $1.25@1.50; common, 50c.@$1. Plums, fancy, ₩ bbl., $10@12; other, $4@7. Cranberries, $2@3 ₩ crate. Grapes, Delaware, ₩ lb., 6@7½c., for home and small boxes; Concord, 2@3c., as to quality. Quinces quotable next week. California pears, $3@4 ₩ box. Virginia peanuts, fancy, $1.75; common to prime, $1.10@$1.65.

GRAIN.—In wheat there has been but little done on export account and millers operating moderately, but better sales have been made on small supplies. Latest sales of old winter red Western at $1.12; new winter red Western at $1.20@1.21; winter red Western for shipment at $1.18; new white Michigan on track at $1.26; old No. 2 Chicago or Northwest for export at $1.14; new No. 2 Chicago spring at $1.18@1.19. Rye easier in price; latest sales at 72@74c. for Western and 85@89½c. for Penn, Jersey and State. Barley is quoted at 95c.@$1 for new four or six-rowed State. Corn has been in active export demand and stronger in price; latest sales are at 57½@58c. for graded and ungraded steamer mixed; 57½@61½c. for ungraded; 60@60½c. for Kansas mixed, including 20,000 bushels at 60c., closing at 60½c.; 58½@58c. for sail mixed; 60c. for New York No. 1. Oats are active at full prices; latest sales at 49½c. for mixed western and State, and 50@50½ for white do. New York unmerchantable at 35c; New York No. 2 at 37@38c.; New York rejected at 34c.; New York No. 2 white at 40@41c.; old mixed Western at 41@50½c.; new white Western at 36@42c.; new Western mixed at 33@42c.; No. 2 Chicago at 48@49c.

HAY AND STRAW.—The receipts are moderate yet and demand running fair, giving a strong market. Baling hay is quoted:—Shipping, 60c.; retail qualities 75@85c.; clover, 55@60c.; salt, 55@60c. Straw is quoted at 70@80c. for long rye; 55@95c. for short rye; 55@60c. for oat.

HIGHWINES bring $1.12 ₩ gallon.

HOPS.—Trade here has been moderate on account of the limited arrivals. Exporters have orders for small lots and pay full prices. About 600 bales have gone West this week. On the better grades some allowance in instances has been paid. We quote:

New Yorks, good to choice, new	32 to 35
New Yorks, low to fair, new	25 to 30
Eastern, new	25 to 30
Yearlings	10 to 20
Olds, all growths	4 to 8
California, new	35 to 35

OIL CAKE.—Western is quoted at $38, currency.

POULTRY AND GAME.—Prices are doing well considering the liberal supplies.

Spring chickens, near-by, ₩ lb., 15@—c.; do. Western, 15c.

Fowls, N. J., ₩ lb 15@16c.; do. Western, 14@15c. Roosters, 8@10c.; Turkeys, N. J., 16@17c.; do. Western, 14@15c.; Ducks, N. J., pair, 75c.@$1.12; do. Western, 65@75c.; Geese, N. J., $2.00@2 50; do. Western, $1.37@1.75.

There is a fair demand for good, dressed stock.

Dry-picked chickens, 16@20c.; scalded, 14@16c.; dry-picked fowls, 16@18c.; scalded, 14@17c.; turkeys, 16@20c.

Grouse are plenty and lower, some lots held in reserve. Ducks doing better. Partridges, ₩ pair, 60@75c.; grouse, do., 50@65c.; woodcock, do., 75c@$1c. wild ducks, red head, 60@70c.; mallard, 55@65c.; common teal, 40@45c.

PROVISIONS.—With export trade small and pretty full arrivals of hogs at the West, prices have been steadily declining. Mess pork quoted at $16.80 for spot lots, September and October deliveries, and $15.60 for December delivery. Bacon, long clear, 9½c.; long and short together, 8¾c.; short, 9¾c. Western steam lard, $10.15 for spot and September delivery, $10.35 for October, $9.80 for November, $9.60 for December. Stearine at 12c. for prime Western. Beef hams at $22@23.00 for Western choice; Tallow at 5¾@6c. for prime. Beef at $8@10 for plain mess, $10@11 for extra mess, $13.50@14 for packet. Tierced quoted nominal for prime and India mess. City extra India mess at $22@23.

SEED.—Small lots of old clover have been taken at 12½c.; nothing done in new clover to arrive; no stock here. New timothy is selling at $1.80.

TOBACCO.—Exporters have bought moderately at firm rates.

KENTUCKY LEAF—NEW CROP.

	Light.	Heavy.
Common lugs	6 @ 6¼	6 @ 7½
Good lugs	6¾@ 8	8 @ 9
Low leaf	8¾@10	9¾@11
Medium leaf	10¾@12¾	11¾@14
Good leaf	13 @14	14¾@15¾
Fine leaf	15 @16	16 @17¾
Selections	16¾@18	18 @20

SEEDLEAF—CROP OF 1875.

New England fine seconds	12½@14
Fine fillers	6 @ 7½
Seconds and fillers, shipping	5¾@ 7
Pennsylvania assorted lots	14 @25
Ohio assorted lots	5 @ 6¾
Wisconsin assorted lots	3 @ 5

VEGETABLES.—Potatoes are active, but the liberal supplies make prices easy. Sweets are very plenty and the low figures send them into use. Pumpkins are slow of sale; for bakers' use marrow squash largely take their place of late years, owing to natural rich color. Tomatoes are low, the family demand having been pretty well supplied for preserving. We quote:

Prime potatoes, bbl., $2.50@2.60; fair, $2@2.12; sweet, $2.37@2.62. Corn, ₩ 100, $1@1.50. Tomatoes, ₩ bush. 35@75c. Marrow squash, ₩ bbl., 75c.@$1. Cabbages, ₩ 100, $5@6. New Russia turnips, ₩ bbl., $2. Egg plants, ₩ bbl., $2@2.50. Cauliflower, ₩ bbl., $2@4. Yellow onions, ₩ bbl., $2; red, $1.50@1.62; white, $2.50@3.25.

WOOL.—The market is strong and fairly active. Manufacturers, having a pretty good trade, are disposed to stock up freely. Western fleeces, California and Texas are chiefly wanted. For the best lots of fleeces at the close, better rates are named in instances; combing and delaine are in good demand and favor the sellers, as also pulled. Ohio X and Pennsylvania fleeces at 44c.; XX do., 43c.; No. 2 and No. 1 do., 39@42c.; coarse do., 33@36c.; combing, 42@47c.; Western fleeces, 37@40c. for X and XX; No. 2 and No. 1 do., 35@36; coarse, 31@32c.; combing, 42@47c.

ROCHESTER, Sept. 23.—Flour market active; spring, $6.75; amber winter, $7.00; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.00. Wheat quiet; Milwaukee club, $1.10@1.21; amber winter, $1.05@1.15; white winter, $1.15@1.25. Oats, nominal at 38@43c. Corn quiet at 58@62c. Corn meal, $1.25@1.50. Butter, 30@31c. Cheese, 14@16c. Eggs, 23@25c. Lard, 18@20c. Apples, bu., 40@60c. Potatoes, bu., 60@75c. Beans, ₩ bu., 70@90c. Mess pork, $17.25. Wool, 20@38c. Hay, $9@11. Straw, $6@8. Timothy seed, $1.50@2.25; clover, $6.00@6.50. Mill feed strong at $16 for shorts, $18 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 35c. ₩ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Sept. 23, 1876.

Two hundred and fifty boxes of farm-dairy cheese were delivered at Little Falls for the week ending Sept. 23d. These were sold at prices not materially differing from those of last week, 10½@12c. having been paid, with the exception of one very fine lot, which brought 12¼c. Although the representation of factories was quite large, yet but few sales were effected. This was due to the fact that, while salesmen were firm in the belief that cheese would command a better price than last week, buyers represented the market as being dull, even at those figures. Light purchases, consequently, was the result—not over 1,150 boxes having changed hands. For these, salesmen, for the most part, received their asking price; but dealers bought sparingly, as will be seen by reference to the following list of sales:

Two lots on commission; 4 do. at 12¾c; 8 do. 13c.; 6 do. 12½c.; 28 do. at 12½c.; 1 do. at 11c.; 2 do. at 12c.

The great advance of the past few weeks has had but little effect on the New York markets. Stocks are pretty much all cleared out, but little cheese being stored in the city, and the light sales will have a good influence on trade at the metropolis. The foreign demand continues good, and the cable has advanced 6s. This is a fair outlook, and there is reason to believe that prices will advance.

We have late advices from abroad. Our London correspondent says: There is a brisk demand for the finest sorts of American, and prices are fully 1s. to 2s. dearer. English cheddar more inquired after. Dutch sells at the advance. Wire from New York to-day quotes an advance. Following are quotations:

American, extra fine, 52@53s.; fine, 46@50s.; good, 40@42s.; secondary, 30@38s. English cheddar, 80@86s.; Wiltshire, double, none in market; Edams, 62@64s.; Goudas, 54@56s.; Dachy shape, 56@60s.

Butter is unprecedentedly scarce. Agents can name their own figure for that landed.

Clonmels, 144@146s.; Corks, 137@139s.; Limericks, 134s.; Dorsets, 166s.; Jersey, 130@138s.; Friesland, 154@156s.; Tralee Corks, 140@144s.; Normandy extra, 120@156s.; American and Canadian, 112@120s.

LIVE STOCK MARKETS.

NEW YORK, Sept. 23, 1876.

BEEVES.—Trade very slow on a heavy run of generally coarse quality horned cattle on Monday last. Prices fell ½c. ₩ lb. on inferior quality beeves; but were firm on good quality steers, which were scarce. Sales were effected from 8¾@9c. ₩ lb.; weights, 5@9 cwt. Wednesday, trade dull, at 8@10c.; weights, 6@8¾ cwt. Thursday, sales small, at 8@10½c.; weights, 5¾@8 cwt. Friday, the markets closed dull at 7¾@10¼c.; weights, 5@8¾ cwt. From 55@57 lbs., net, has been allowed. Spanish herds, direct from the Plains, sold at 8@8¾c. ₩ lb. Native steers, grass-fed, 8¾@9c.; part corn-fed do., 9¾@10c.; grade do., 10¾@11c. Oxen, 8¾@9¾c. Heifers, grass-fed, 8¾c. Bulls, 3@3¾c.

MILCH COWS.—Trade remains slow and small, the quality of the animals to hand being from poor to fair. Prices, $29@45, calves included; general sales at $35@55 ₩ head. Springers in rather better demand than fresh cows, such like being needed to return to the country; prices, $50@60 ₩ head.

VEALS AND CALVES.—Coarse quality calves, part grass-fed and part buttermilk-fed, sold at 3½@6¾c. ₩ lb.; general sales at 4½@6c., also at $6@11.75 ₩ head; general sales at $8 ₩ head. Smooth quality veals sold at 7@9¾c.; State do. at 7@9¾c.; Jersey do., 7½@9¾c.; Pennsylvania do., 6@8¾c. The calves to hand exclusively reported from New York State.

SHEEP AND LAMBS.—On Monday trade opened very dull, still there was no further reduction of rates. Sheep sold at 4@6¾c. ₩ lb.; lambs, 5¾@6¾c. mixed flocks, 5c. Wednesday, trade slow; sheep, 5¾@6c.; lambs, 5¾@6½c. Thursday, sales light; sheep, 4@6c.; lambs, 6@6. Friday, the markets closed dull; sheep, 4@5¾c.; lambs, 5¾@6¾c. State sheep, 1¾@6¾c. ₩ lb.; Canada do., 4¾@5¾c.; Ohio do., 5@6¼c.; Pennsylvania do., 6@5¾c.; Kentucky do., 5¾@6¾c.; Canada lambs, 6¾@6¾c.; Jersey do., 6¼@6¾c., with a few at 7c; State do., 5¾@6c., with one car load at 6¼c., and a few at 6¾c.

HOGS.—Trade slow and small: 80 State hogs, 304 lbs. ₩ head, live weight, 6¾c. ₩ lb.; 42 State do., 240 lbs. ₩ head, live weight, 6¾c. ₩ lb.; 98 Ohio do., 219¾ lbs. ₩ head, live weight, 6¾c. ₩ lb. City dressed hogs still slow of sale; extreme range of prices, 7¾@2c. ₩ lb., general sales, 7¾@8¾c. ₩ lb., all weights included.

HORSE MARKET.—City trade continues to be influenced by the broken condition of the weather. High-priced, valuable horses are almost entirely held on sale. Fifty poor quality light harness horses sold at $40@62 ₩ head; 45 do. at $55@105 ₩ head; 20 ordinary do. at $122@195 ₩ head; 10 do. at $180@220 ₩ head; 11 pairs family carriage horses at $300@375 ₩ pair; 3 pair stylish carriage horses, aged, at $600@760 ₩ pair; 5 inferior saddle horses at $100@175 ₩ pair; 2 pairs heavy draft horses at $500@600 ₩ pair; 9 do. coarse quality at $195@227 ₩ head; city railroad horses at $80@105 ₩ head; stage line do. at $110@200 ₩ head.

PERSONAL ITEMS.

BACK-BITERS—fleas.

MR. WALTER of the London Times is in this country.

THE palace in Genoa once occupied by Byron has been burned.

OFFENBACH is writing his American impressions for the "Figaro."

THE man who carries all before him—the wheelbarrow man.

MR. ELIHU BURRITT is writing local history at New Britain, Conn.

LEON Y. ESCOSURA, the Spanish painter, is on his way to this country.

UPON what subject in nature has every author written—upon the earth.

MISS MAY ALCOTT has sailed for England to study art there and in Italy.

MISS BELLA ST. CLAIR walked 1,000 miles in 1,000 hours in Woolwich Gardens, London.

"PARASOL-HOLDERS" is the Saratoga name for young men who part their hair in the middle.

EVEN the records of "high society" show that a wife's occupation is too often—fretwork.

THE market reports speak of the tendency of all provisions as "downward." What more natural?

A GOOD citizen is a peacemaker. But, says a surly friend, so is a bull in a china shop; it make pieces too.

VON MOLTKE—who is 77—is declining in health. He caught a severe cold lately which has turned to influenza.

THE Khedive of Egypt is about to discharge all his American officers. Something wrong in the accounts perhaps.

"WE find that he came to his death by calling Bill Jackson a liar!" was the verdict of a coroner's jury in Missouri.

IT was said of a certain judge that he was so reserved in his manners that one would never suspect that he had any.

IN the Tunisian department of the Centennial they say the "State days" are nothing to the Days they have at home.

PROF. SWING'S church in Chicago will take no part as a church in Mr. Moody's revival services, soon to begin in that city.

EVEN dealers in grave-yard "sundries" feel the pressure of the times. A dealer advertises "Headstones greatly reduced."

COMMODORE VANDERBILT refuses to do it. He is alive and receiving friends. We shall destroy that obituary notice next week.

AFTER all, says an old doctor, there are only two kinds of disease—the one of which you die, and the other of which you don't.

MR. HEPWORTH DIXON'S manuscript relating to the Holy Land was destroyed at the burning of a printing establishment in London a short time ago.

THE letters signed "Canadian" in the London Times, on the difficulties between Canada and British Columbia, is from the pen of Sir John Rose.

THE most infallible way of preventing a kitchen door from creaking is said to be to engage a servant girl whose sweetheart comes to the house to see her.

MR. JAMES WADSWORTH, the owner of one of the largest and most beautiful estates in the State, has just been married at Newport to Miss Travers of New York.

"THAT'S carrying the thing altogether too far, you know," as the man said when he got off the cars at the Centennial, and found his trunk had gone on to Pittsburg.

"WHY do the butterflies wait their wings?"—a 22-verse poem, by "Esmeralda," is respectfully declined, with the information that they have to do it or walk.

POLO hats for gentlemen are the latest. They are the ordinary high hat with the top smashed in to represent where the mallet fell during the excitement of the game.

THE Buffalo bride reported to have received $100,000 in cash as a bridal present, has already on hand nearly 10,000 begging letters from Europe, Asia and the United States.

A MAN in Boston, in his hurry to assist a fainting lady, got a bottle of mucilage instead of camphor, and bathed her face with it. She was a good deal stuck up with his attention.

THE coins lately found near Jerusalem are sheckels and half sheckels of Judea, silver, with a cup of manna on one side and on the other the budding rod. The date is 141 years B. C.

RHODE ISLAND farmers cut hay in the night. When one of them gets nervous and can't sleep, he gets up and mows the State over, after which he goes to bed and gets a good night's rest.

THE corner-stone of the monument to Gen. Williams, one of the captors of Major Andre, was laid last Saturday at the old stone fort near Schoharie Court House in Schoharie Co., N. Y.

THE will of Felicien David, the composer, contained the following injunction:—"My funeral is to be as simple as possible, and to be conducted without the assistance of any minister of religion."

MAJOR JOHN H. GEE, commandant of the Confederate prison at Salisbury, N. C., during the rebellion, met with a distressing death recently at Quincy, Fla. A fire was making rapid progress, and while he was assisting the firemen, the wall of a burning building fell upon him, and he was literally consumed.

MISS SUSAN DICKINSON, a sister of Miss Anna Dickinson, edits a newspaper in Luzerne County, Pa.

TOM HOOD'S house at Waastead has been sold at auction with all its literary and historical associations for £2,500.

A CITY young man who read "Now is the time for husking bees," chased a bee fifteen minutes to ascertain what kind of a husk it had on.

MR. PIERREPONT evidently believes that "a good name is better than precious ointment," and that's why he's changed his so often.

IT strikes us that with such leaders as Horvatov-itch, Prot-itch, and Popon-itch, these Servian troops ought to come bravely up to the scratch.

THE man who played the organ at Notre Dame at the coronation of Napoleon I., has just died. His name was Michel Engalbert, and his age 96.

A SOLDIER on trial for habitual drunkenness was addressed by the President of the court-martial:—"Prisoner, you have heard the prosecution for habitual drunkenness; what have you to say in your defence?" "Nothing, please your honor, but habitual thirst!"

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

D. J. Remaly, Westmoreland Co., Pa.—Inclosed I send you two leaves for you to examine and tell me through the RURAL the names of the plants. The larger leaf is of a plant that has been called Bleeding Heart in this section of country, but there is no such name in the catalogues. The flower is pink and something like Begonia. The veins of the leaves on the under side are red, and the plant dies down to the ground late in the fall and sprouts in the spring. Is it a Begonia, or is it *Gesnera zebrina?* The other is a pretty, variegated plant. The stock and leaf stems are red and the leaf is green, variegated with white and an occasional red spot. I would like to know the name of this plant and something about it, whether it is easy to keep over winter and whether it is tuberous-rooted and will die down in the fall, and when it will bloom. I know it can be raised by cuttings, as that is the way I got mine. ANS.—It is a tuberous-rooted Begonia—*i. e.*, the larger leaf. The other is *Achyranthes Gilsoni.*

Lorenzo Rouse, Oneida Co., N. Y.—I send herewith a specimen of an annual which grows abundantly in my cultivated grounds from self-seeding. Please name it. The only name I have ever heard for it is "Matrimony Vine," but I notice in the last RURAL that you give that name to something entirely different. Hence my desire to know the true name of the plant I send. The sample inclosed is a small one, the plant usually attaining a length of two feet or over, with many branches.

[The above specimen was so crushed that we could tell nothing about it. Our correspondent accordingly was requested to forward another in a box, to which he kindly replied as follows.—ED.]

I send herewith a small box, as you kindly suggested, containing a sample of the plants for which I desired the true name. I find it difficult to obtain good specimens so late in the season, but those I send furnish the flower (which you will perceive is quite small), also seed pods, and, I think, some ripe seeds. It is, perhaps, not properly a *vine*, at least is not a *twiner*, but still seeks support from other bodies, and in such cases I have known it to attain a growth of two or three feet. Otherwise it falls to the ground. We have found it very useful as a trimming to bouquets. Indeed, for this use we have considered it almost indispensable. I am unable to say whether it is indigenous or exotic, or where I first obtained it. Where it has once been introduced it retains a permanent footing, but is not difficult to eradicate. ANS.—*Fumaria officinalis.* It is close to Mountain Fringe (*Adlumia cirrhosa*) and, indeed, quite resembles it. Introduced from Europe.

Mrs. J. P. H., Goshen, Ind.—Please give in the RURAL some account of Hibiscus grandiflora. Is it hardy? Will a small one be likely to live if put out this fall? Botany says it is hardy, but some of my friends think it a house plant. Any information will much oblige. ANS.—Yes, the H. grandiflora grows wild in Southern Illinois and Southern Ohio, and is hardy in most if not all the Northern States. But there are many tender exotic species cultivated in greenhouses.

W. H. A.—I send you to-day a box containing three beetles of some sort, packed in sawdust. They are now alive, but may not be when you get them. I found them on my quince trees. What are they? I thought perhaps they might be the quince curculio. ANS.—The small beetles about a half inch long, of a yellowish color, covered with short hairs, are the American *Celonia*, or as now classified in our entomological works, *Euryomia Inda.* It belongs to the same great family of insects as our common May beetle, and it is frequently found eating the silk from corn, boring into ripening peaches and other fruits. It is not allied to the quince or other species of curculio.

Wheat Grower.—To keep weevils from seed-wheat, put it in tight barrels mixing in a half pound of gum-camphor broken up into small lumps, then head up tight; a little benzoin poured into the barrels will also answer the same purpose, but the fumes are more likely to pass off sooner than those of the camphor.

Photographer.—We do not endeavor to keep informed in regard to the progress of the photographic art, but the largest picture from a single negative which we remember of noticing a description of was taken in New South Wales by one HALTERMAN, a gold miner. This picture is five feet by three feet two inches, and is described as being very perfect.

Eucalyptus.—It would be useless for you to attempt cultivating the Australian Fever Tree in Ohio, for it is too tender to grow even in Georgia.

J. E., Shelbyville, Ind.—The *value* or *reserve* is the amount a company is required by law to place to the credit of a policy. The *surrender value* is the price a company will pay to be released from its bargain. Some companies indorse this value on their policies; others have a fixed rule for calculating it. The company you mention appears to act very illiberally in this regard and to have no rule whatever that we have been able to discover. The value of No. 21,903 was, on the last anniversary of its issue, $147.79; on the next it will be $177.03. Value of No. 22,025, anniversary of this year, $41.51, and for additions, $13.94; and the next will be $48.51. Value of No. 22,026, this year, $225.88; next year, $282.40. The amount of outstanding loans or notes being in each case deducted, the remainder will be the cash reserve.

Country Boy.—The Leather-wood or Moosewood (*Dirca palustris*) found in our Northern woods is quite a pretty ornamental shrub, but its bright, orange-colored berries are poisonous, and children should be taught not to put them in their mouths, much less to swallow the juice or seeds. The bark of this shrub is also said to cause redness and vesication when applied to the skin, and sores made by it are difficult to heal.

Subscriber.—The recipe for making an irritating plaster appeared in the RURAL of Jan. 15 the present year. The one ingredient named as "Pike-root" must, we think, have been a misprint and intended to be Poke-root (*Phytolacca decandra*), as we do not know of any plant by the name of "Pike." The plaster, however, would probably be just as efficacious without the Poke-root as with it, because it does not possess vesicatory properties like the Indian Turnip, which was also named in the recipe referred to.

Musical Instruments.

REMOVAL-200 PIANOS & ORGANS at half price. The Subscribers will sell their Entire Stock of Pianos & Organs, new and second hand, of six first-class makers; sheet music, and S. S. music books, *at* 50 PER CT. OFF, for cash previous *to* removal *to* their new store, 40 EAST 14th St., UNION SQUARE. Oct. 12th. Illustrated catalogues Mailed. Monthly Instalments received. THAT RASPBERRY.

The THWACK leads all other sorts in prolificness, hardiness, firmness, size, color and flavor. Endorsed as the best by J. C. EVANS, President of the Missouri State Horticultural Society, and hundreds of others who have fruited it.

Endorsement of the Pike County (Mo.) Horticultural Society, at its July Session, 1876:

Resolved, That the Thwack Raspberry, as grown at Foster's Hillside Nursery, possesses more fine qualities for market or table uses than any other raspberry we know of. Its extreme hardiness and prolificness, as well as its superior shipping qualities, large size, brilliant color and good flavor, make it the favorite wherever known. Unanimously adopted. T. E. WHITLOCK, Secretary.

Address, with stamp for Circular,
FOSTER'S HILLSIDE NURSERY CO.,
Louisiana, Mo.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN

BETWEEN

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Wit and Humor.

POOR, POOR MAN.

"HAVE you any old clothes, mum, as you could give a poor man who has a sick wife and six small children to support?" inquired a dilapidated person last Saturday, at the door of a High stroet residence.

"I've got a coat with but three buttons gone, and a pair of pants that have had but a small patch behind, which I guess you can have," said the good woman, after she had examined her closet.

"Is the coat double-breasted, with a velvet collar?" inquired the poor man.

"No, sir."

"Are the pants of a plaid pattern and cut with spring bottoms of twenty-two inches?"

"No sir."

"Then I guess you needn't trot 'em out," said the poor man. "They ain't my style, and I don't want 'em."

SPARKS AND SPLINTERS.

"YOU want nothing, do you?" said Pat. "Bedad, an' if it's nothing ye want, yo'll find it in the jug, where the whisky was."

EVEN history now and then drops into an unintentional pun. Take for instance the fact that Louis Eleventh was driven in XI-le.

SCENE: Young ladies' boarding-school. Professor—"What can you tell of Pluto?" Miss D.—"He was the son of Saturn, and when his father died he gave him hell."

"MAMMA," said a young hopeful, who against his will was made to rock the cradle of his baby brother, "if the Lord has any more babies to give away don't you take 'em."

"YES," said an old Missouri farmer, "I believe in mental cultervation. Next to cultervating corn, I believe it's the profitablist thing a man can do, unless it's growin' pork."

A CHICAGO paper says that a "Mr. Kennedy was shot yesterday in the neighborhood of the canal, where he lives." That must have been in the neighborhood of the alimentary canal, we suppose.

"I GUESS dad wishes we'd all die and go to heaven," said a miser's son to his maternal parent. "Why so?" she asked, upon recovering from her astonishment. "Oh, 'cause Heaven's such a cheap place to live in."

MOST of the Shelbyville (Ky.) dogs sit in the back yards and howl all night, so that people will know they are not away anywhere killing sheep. A man has to own more sheep than we do before he can appreciate the grandeur of such exemplary conduct.

A COOL young gent entered a menagerie with a cigar in his mouth, when the proprietor politely requested the visitor not to teach the other monkeys bad habits. The young man proved himself equal to the occasion by producing a cigar case and saying: "Try one."

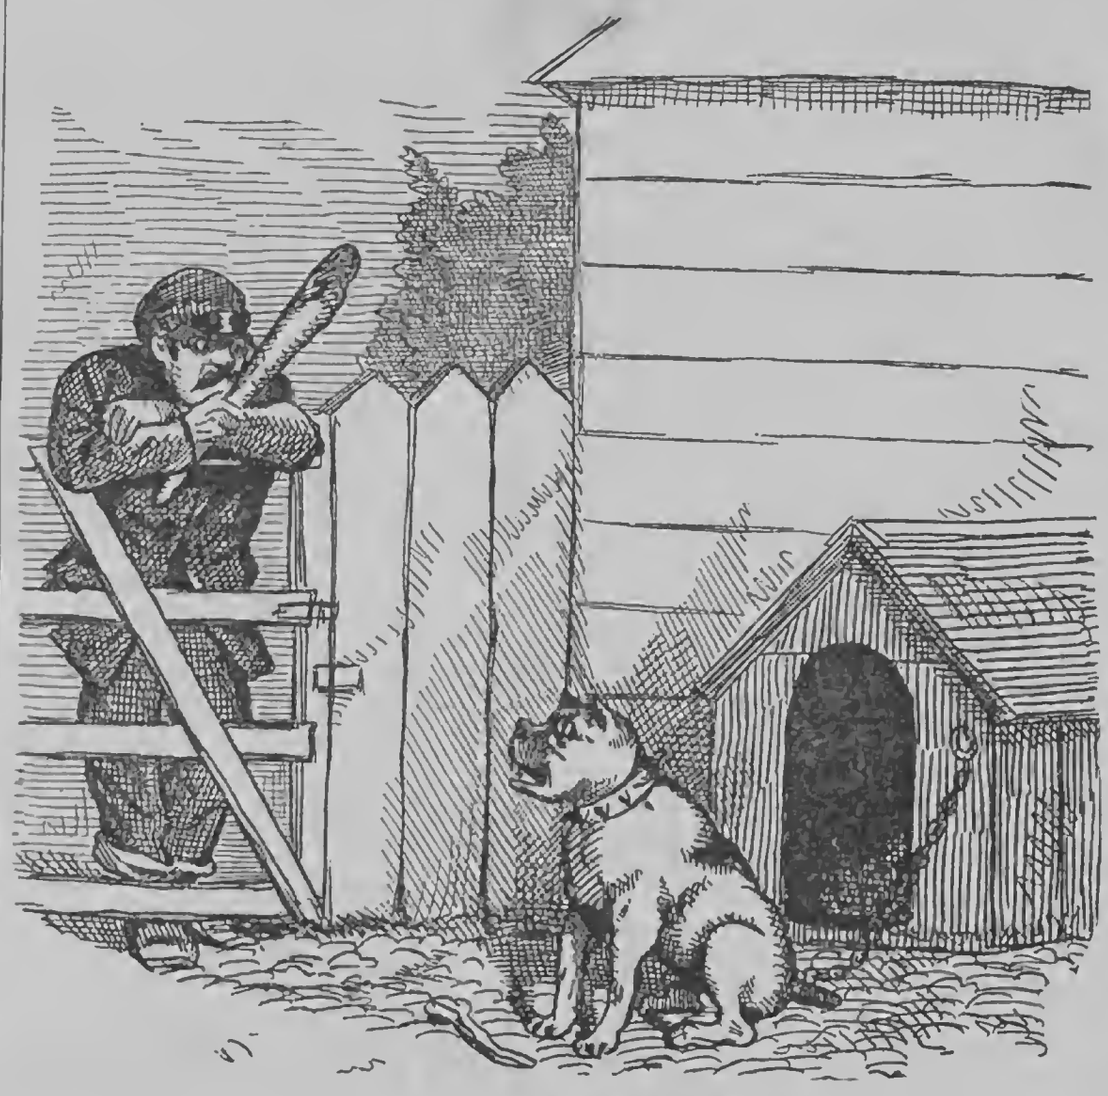
A GILT-EDGED and superfine young man stepped into a barber's shop the other day to get shaved. The knight of the razor eyed him quizzically for a moment, and then remarked: "You must either take down that shirt collar or wait for a shave till I can borrow a step-ladder."

ONE Ohio editor says of a contemporary who had assumed the part of a mummy in a dramatic performance:—"He was obliged to put a little animation into himself to come up with the character, and to wear more recent linen; but that was about all. Nature had admirably qualified him to act the part."

A SNOB once asked the celebrated carver, M. de Pomnat, who recently died in Paris, if he had learned his art at the King's table or kitchen. "At neither," replied the renowned carver; "it was from having so often to slice off the ears of insolent puppies that I acquired it. You now see how I can cut up a goose."

AN Irishman's friend having fallen into a slough, the Irishman called loudly to another for assistance. The latter, who was busily engaged in cutting a log, and wished to procrastinate, inquired, "How deep is the gentleman in?" "Up to his ankles." "Then there is plenty of time," said the other. "No there is not," rejoined the first; "I forgot to tell you he's in head first."

PROF. GORINI of Padua, has arrived in Paris to exhibit to the Academy of Sciences his process of petrifying human remains. Some months ago a young husband went to the professor and asked him what it would cost to petrify his mother-in-law. "What particular member would you desire petrified?" asked the professor. "The right hand, to avenge blows given in the past and prevent those that might be given in the future." Then she is not dead?" "Alas! no." I can do nothing for you; I only operate on dead bodies." "So I was told," replied the husband, "but I had hoped that you would have contracted to prepare her for the process as well."



DITTO, BROTHER SMUT.

BURGLAR—Hah: you'd be a nice customer to meet any where after dark, wouldn't you.

USE ONLY THE BEST.

THE RUBBER PAINT

IS THE

BEST PAINT IN THE WORLD.

There is no Paint manufactured that will resist water equal to it. MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend as a present, at our lowest club rate—only $2.15, including postage.

Arboricultural.

WALNUTS AND HICKORY-NUTS.

From the time when the Mythological Gods were supposed to reign and hold the destiny of the human race in their hands, the nut-bearing trees and shrubs have been highly valued in the Eastern Hemisphere. Indeed, the Walnut of

Fig. 2.

Europe was considered in earlier times so good and valuable that it was dedicated to Jove, and thus came the botanical name of the genus to which it belongs, viz., *Juglans*, from *Jovis glans*, the nut of Jove, it being considered food fit for this much-worshipped God of the ancients.

However much we might question the taste of a people who extolled the Walnut so highly, we have only to remember that it is not many generations ago that Acorns were considered very good food, for common folks at least, and Acorn Bread was far from being a rarity in Great Britain. But as we have no mythological history to fall back upon in throwing a halo of glory about the products of our own nut-bearing trees, necessity compels us to base all praise of them upon actual worth, which, by the way, is rapidly becoming, with Americans, the criterion for judging of all things terrestrial.

The effects of cultivation upon any species of tree or other plant are always seen in the variations of seedlings raised therefrom, and this has been the result of long domestication in the European Walnut (*Juglans regia*). For thousands of years, as we have said, this nut has been highly prized by the inhabitants of the Old World, and millions of its seedlings have been raised during the period named. With the natural tendency of all plants to vary, it would have been singular if some really choice and distinct varieties of this nut had not been produced during its long domestication, and under the circumstances we might have expected a greater number. There are, however, some excellent sorts which are well worthy the attention of the residents of our Middle and Southern States, and perhaps those in favorable locations at the Northern.

The common English Walnut thrives in the vicinity of New York City, but while some of the trees are very productive, others are almost or totally barren, this difference probably being due to protection from northerly winds and to favorable or unfavorable soils. In the Middle States no such variations, we believe, are observed, and there are no good reasons why large plantations of these nuts could not be made with fair prospects of success and remunerative returns on the investments.

The number of varieties known in Europe is, as we have said, quite large; but for a commencement our farmers and arboriculturists would probably not care to experiment with only a small number. In a late issue of the London Garden we find an exhaustive article on the "European Walnut and its varieties," from which we copy three of the accompanying illustrations.

The largest of all the varieties yet produced is known as the Gibbous' Walnut (*Juglans regia gibbosa*), Fig. 1. In Fig. 2 the same variety is shown with the outer husk removed. The tree is described as having a very straight stem, covered with an ashy-gray bark. The branches are thick, with the bark of a shiny surface and a ruddy brown hue, speckled with elongated strie. The rind of this nut is thinnish and marked toward the base with ashy-gray elevations, which, toward the top of the fruit, become so crowded together as to give it some resemblance to our common Black Walnut (*Juglans nigra*). The shell is thick and hard to the touch, and deeply corrugated. The flavor of this variety is excellent and the kernel easily extracted from the shell; but, like all the hard varieties, the shell is thick and there is an inner deposit which considerably reduces the size of the kernel. We do not know whether this rather remarkable variety has been as yet introduced into this country, but presume it will be ere long.

The Variegated Walnut (*J. regia variegata*) is another remarkable variety. The young branches are covered with a dark-green bark, spotted with gray and striped longitudinally with yellow. The rind of the nut is also slightly striped with two shades of green. The nut is said to be excellent in flavor and the shell very thin. In addition to the above there are several other large French sorts of excellent quality. Among the most noted of these we may name the Noix Meyette, Franquette, St. Jean, Chabert, Parisienne, and Octagona.

Thousands of bushels of what are termed English Walnuts or Madeira-nuts are annually imported, and we know of no good reason why, with our wide diversity of climates and soils, this should continue for another century, as it has during the past, for at least some of the many varieties of this nut might be raised in abundance if the trees were planted.

Of our own species of nuts belonging (according to late botanical classification) to the genus *Juglans*, the common Black Walnut (*J. nigra*), and the Butternut (*J. cinerea*), little can be said beyond what is generally known to everybody. The first is a noble tree, valued mainly for its wood, which is used for making furniture and inside finish for dwellings. The nuts have such a strong, rank flavor that few persons find them agreeable. The latter, or Butternut, is not quite so highly valued for its wood, although it is extensively employed for the same purposes as the former, but the nuts have a sweet, rich flavor, and are generally appreciated by the residents in regions where they abound. The shell is so thick and hard, requiring a smart blow to crack it, that the nut does not meet with so ready a sale in our city markets as it would if it were different in this respect.

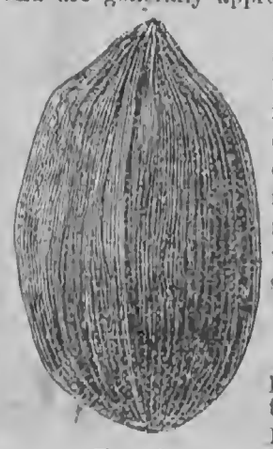

Fig. 3.

HICKORY-NUTS.

The earlier botanists placed the Hickories in the same genus as the European Walnuts, our Black Walnut and Butternut; but later authorities have divided the genus *Juglans*, giving to the former section the name of *Carya*, which comes from the ancient Greek name of the Walnut.

The Hickories not having been cultivated to any considerable extent in this or any other country for their fruit, we have in consequence few very distinct sorts of any of the half-a-dozen or more native species, still an occasional one has been found, and could our gardeners discover some ready means of propagating them, we would soon have Hickory-nut orchards in abundance, for the best of those already known are second to none of the most valuable varieties of the European Walnut. In fact, the nuts of two native species as found growing wild in the forests, the Pecan-nut (*Carya olivæformis*) and the Shell-bark or White Walnut (*C. alba*) are annually gathered and sold by the thousands of bushels, and but few persons would exchange them for any foreign variety of Walnut.

The common Pecan-nut is well known and is usually to be found during winter in every city and village market. The trees grow wild in moist, rich lands all over the Southern States and as far north in the Western as the southern part of Illinois. There are, it appears, many wild varieties, some double the size of others, and the form and the thickness of the shell are also quite variable.

One of the most remarkable varieties which has come under our notice is one found near New Orleans, La., a few years since, and for specimens of which we are indebted to James H. Hummel, Esq., publisher of Our Home Journal, of the above-named city. This variety is nearly double the size of those usually found in market and of an irregular form (as shown in Fig. 3), it being somewhat flattened on one side, with acute, elevated ridges running from the upper point to base. The shell is slightly thicker than the ordinary varieties, but the kernel is large, fine-flavored, and it is altogether a remarkable nut, worthy of preservation and propagation.

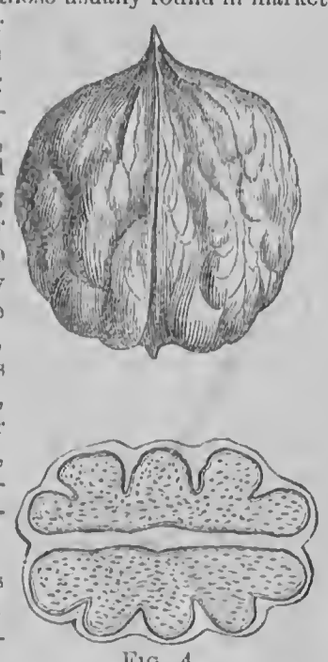

Fig. 4.

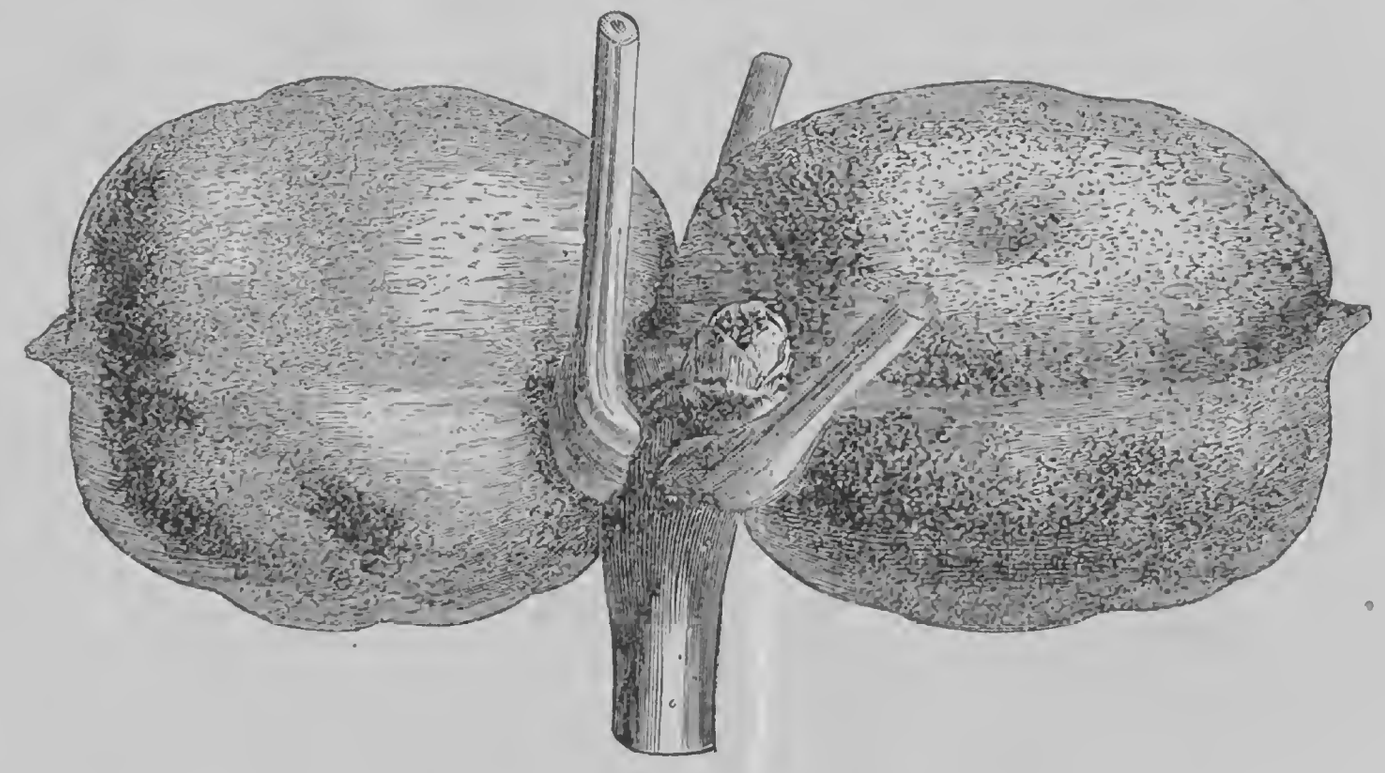
The next species of Hickory most valued for its excellent flavored nuts is our common Shell-bark, which also varies greatly in the size and thickness of the shell in different soils and regions of country, still all are readily distinguished from other species by their thinner and lighter-colored shells and sweeter-flavored kernels. In our many years' search for peculiar or choice sorts of these nuts, none have been found possessing more valuable qualities or that were more distinct in appearance than the "Hales Paper-shell," so named by us and described in the Rural New-Yorker of Nov. 19, 1870. The original tree of this remarkable variety is now growing upon the grounds of Mr. Henry Hales, near Ridgewood, N. J., and is probably not less than seventy-five years old. The stem of the tree is sixty or more feet in hight and some four feet in circumference at the base. The nuts differ from the ordinary Shell-barks by not having any regular corrugations running from base to point, nor any sharp angles, as usually found upon the shell of this species, but the surface is broken up into small depressions, giving it an appearance very similar to the European Walnut. In fact, had any one tried to produce a hybrid between the two species and obtained a nut like the Hales, it would have been considered by most persons as positive proof that the experiment had been successful. But as we happen to know that no such influence was brought to bear upon the parent of the Hales, its peculiarities must be attributed to natural variations.

A good idea of the general size and appearance of this variety can be obtained from Fig. 4. The lower or cross section shows the size of the kernel, also the form and thickness of the shell.

Whether this variety will ever be successfully propagated by any of the methods now practiced, is somewhat doubtful at present, for out of several thousand seedlings grafted from the original tree, and by a number of excellent propagators of such plants, less than fifty cions were made to unitewith the stocks or



GIBBOUS' WALNUT.—(Fig. 1)

have lived to the end of the second season. Seedlings of the Hales would probably revert back to the original form.

OTHER SPECIES OF HICKORY.

For size of nut, the Western Shell-bark (*C. sulcata*) exceeds all other native species. They are sometimes found fully two inches long, with

Fig. 5.

a point at both ends. Husk very thick, also the shell, which is coarsely ribbed and of a dull white or brownish color. Fig. 5 represents a specimen of this species received from Kansas, the cross section showing the size of the kernel and the thickness of the shell. The flavor of the kernel is good enough, but there is too little meat for so much shell. Hence these nuts are seldom gathered for use.

The Mocker-nut, or White-heart Hickory (*C. tormentosa*), is a very common species in the Eastern States; but the nuts have too thick a shell to be of value. The timber of this species, however, is very valuable, as is well known to our farmers and mechanics generally.

Fig. 6.

Then we have what is called the Pig-nut (*C. porcina*). The fruit before being divested of the husk is pear-shaped, but the nut itself is oblong-oval and has a rather hard shell, with a somewhat bitterish-flavored kernel.

The Bitternut (*C. amara*), found mainly in low, moist grounds, bears a small nut, with very thin shell, but the kernel is exceedingly bitter, and hence the common name. The tree is rather slender-branched, and the terminal buds on the twigs are quite distinct from the three first-named species, which are large and of a roundish, blunt form, while those of the latter are quite small and pointed, as shown in Fig. 6, and are covered with a yellowish, downy pubescence.

A UNIQUE VARIETY.

We cannot refrain from mentioning one very unique variety of Hickory-nut received from Connecticut a few years since. The species of Hickory to which this variety belongs we have no means of determining, but were informed that it is a genuine Shell-bark (*C. alba*). All the nuts borne by the tree are of the form and size shown in Fig. 7, the lower half of one lobe of the nut being deformed, or, as it would appear, failed to develop. This singular malformation of all the nuts upon a tree is, we own, a mystery for which there is no accounting with our present knowledge of vegetable physiology, and we leave it in the hands of "Darwinites" for explanation.

Fig. 7.

These curious freaks of nature are especially interesting to the scientific arboriculturist, as they often aid him in unraveling many a knotty question in regard to the development or evolution of species. There are doubtless hundreds of such freaks or varieties to be found in the forests of this country, and we hope every reader of the RURAL NEW-YORKER will be on the look-out for them, and, when found, send us specimens for our cabinet. We also would like to get specimens of the different varieties of all native species, in order to ascertain how widely they differ, and the influence of soil and climate upon the nut-bearing trees of our country.

We intended to have said something about nut-bearing trees from the seed, also how to transplant and manage them in after years, but for want of space this will have to be deferred to another time.

Farm Economy.

OUT-LOOK OF FARMING IN BRITAIN.

A CORRESPONDENT writing to the Mark Lane Express, in speaking of the general prospect of the cereal crops of Great Britain says:

The present prospect of the tillage farmer is far from cheering. The whole of the cereal crops of the year are under an average in point of yield per acre; the area under wheat is the least for the last quarter of a century, and the quality to a great extent is still dependent on the season. The wheat crop of 1875, taking quantity and quality, was one of the most unprofitable to the producer on record, and yet the prices throughout the harvest year have ruled extremely low—a clear proof that our increasing population is not dependent for their supply of breadstuffs on the produce of English soil. It is every day becoming more apparent, that if the British farmer is to maintain his position he must of necessity direct his energies to an increased production of milk and meat. There are certain agitators, possessing only a slender stock of agricultural knowledge and experience, who are urging the farmers to lay down the whole of their arable lands to grass: every practical farmer knows that if he is to keep a large head of stock on his farm he must of necessity grow a certain breadth of straw and roots. Although the wages of the agricultural laborer are nominally high, the improvements in agricultural implements and machinery have placed the farmer in a very different position to that of even fifteen years ago. Compare the cost of getting in the harvest, one of the most important and expensive operations of the farm, in the past and present respectively. In the days of the scythe and the sickle, taking the whole of the crops on a large farm the cost of cutting, carrying, and thatching, amounted to from 14s. to 20s. per acre. The harvest then not unfrequently lasted over a period of six weeks. Now, with a good machine, attended by eight active hands, 12 acres per day of a fair standing crop can be cut, tied, and set up. Again, at the stack, a sheaf elevator worked by a pony readily does the work of three ordinary hands. I maintain that on a large farm, well equipped with machinery, the harvest can now be secured for less money per acre than it could in 1861, although the wages of the agricultural laborer have meantime increased 50 per cent.

Your correspondent need have little fear that the interests of agriculture or of the community will materially suffer even though a few estates should fall into the hands of men who have acquired large fortunes in mercantile pursuits. Who are the great pioneers of the improvement of our live stock, the implements and machinery of the farm, and even the soil itself? Is it the hereditary chief who can trace his lineage and the history of his broad acres in unbroken descent from the days of William the Conqueror to those of our own time, or is it he who, through innate perseverance and force of character, has risen from the ranks? The hereditary lords of the soil are beset with many grave difficulties: however anxious many of them are to equip their farms with all modern requirements in the shape of permanent improvements, they have not generally the means to do so at command. Many a landlord with a large rent-roll is only the nominal owner. Not unfrequently he is saddled with the interest on mortgages which have descended to him with the patrimony, besides settlements to relatives, all of which tend to curtail his income.

On the owner devolves all the duties and responsibilities which naturally attach to the ownership of a large estate without the means to discharge them satisfactorily. The present is a trying season for all classes whose incomes are fixed. The indulgence of expensive habits amongst all classes of society is a besetting sin of the age, and by no other class is this more keenly felt than it is by the landowner, who finds his expenditure yearly increasing, whilst his income rather diminishes than increases, and the purchasing power of his gold gradually grows less. When the growing confidence has been fully restored, I hope for happier and more prosperous times both for the owners and occupiers of the soil. Your correspondent advocates leases as the great panacea for all the ills from which agriculturists are now suffering: to my mind a lease without a well-defined Tenant-Right is somewhat like a ship without a rudder—completely at the mercy of every storm.

Many who are only partially acquainted with the system of landholding in Scotland attribute the advanced state of agriculture in that country to the prevalence of leases: there are other causes which have contributed in an equal degree to this result, the most prominent of which have been a higher standard of education, a simpler medium of circulation, and more liberal system of banking than that offered in England. We are no doubt on the eve of great and momentous changes, both as regards the owner and the occupiers of the soil. Though no advocate of small holdings, yet I deeply deplore the loss of the yeoman proprietor, who is gradually disappearing from the land, and, with him is departing that sturdy independence for which the race was so justly celebrated. Both owners and occupiers are now thoroughly cognisant of the necessity of giving security to the tenant for the capital embarked in improving and cultivating the soil. I hope to see arise, Phœnix-like, from the ashes of an effete system, a more generous treatment of old Mother Earth. Then she will literally teem with plenty, and will repay with usury the talent committed to her care.

WHAT I'VE LEARNT LATELY.

THE Agricultured Gazette in speaking of the veteran agriculturist, Mr. MECHI says:

One derives, and has derived, so much information from time to time from the genial utterances of Mr. Mechi, the result as they are of a never-wearying observation, that I venture to follow, at whatever distance, in his track, and give my agricultural friends some hints, drawn from my own personal experience. In the first place our second crop of clover, a very fair one considering the season, being just down, and some heavy showers, so much needed upon the farm elsewhere, having succeeded rather suddenly with the probable effect of our being only enabled to save this valuable fodder by the most anxious exertions, I am prepared with a load of refuse salt, wherewith to strew the loads well as they are brought in, in some degree of necessity, if not damp, at least in a condition approaching it from the field. The observance of this precaution is just one of those things which our obstinate men for some reason detest, and would manage to avoid, were I not present in the flesh. We treated a second crop of clover thus three years since. It was lovely to look at as it grew, it was abundant, and cut in the fairest weather; but of course August is never responsible for its temper, and so before we could carry we got it well soaked, and that, unhappily, at the most destructive period—that is, when it was fully half dried, and lost, consequently, sugar with every wash.

Well, there was nothing for it but to put it together under all chances in a rick. Nice, black, foggy stuff it was, too. The very hinds held their master in contempt. The bailiff was beside himself with disgust. Still, as our rule is, we persevered; we were obstinate. Well, the winter came, and I tried it before a few things. They would not even pick it over. "Might do for young Irish things that don't know any better, brought up on bog juice and rushes," an inspecting friend observes. We are obstinate, we observed, and so we merely gave orders that the food be changed, and the convict rick be left alone. After a while, one bright morning, we found the cowman littering a yard with our experiment, and sneezing vigorously as the dust flew up his nose. Whose order was this? Oh, between them they had thought it was of no good for anything, and so, although there was plenty of legitimate straw about, they must needs go and interfere with my pet stuff. It is just one of those stupidly superfluous performances which rustics, the best of them, are given to. It fired my wrath at once, and I astonished their weak nerves; and had the satisfaction of finding, 12 months after, this black sodden stackling (it was not a large one) intact, with only wanting to be thatched anew.

This season we were short of hay, and out of the purest obstinacy I obliged the shepherd to carry up with me, or it would not probably have been properly done, an armful of this frightful fodder. The sheep were upon swedes. The flock rushed up at once on our arrival, and to my delight no less than their attendant's astonishment, they pitched into the racks at once, and never left them until they had consumed every scrap, picking even the bones. I did nothing more than give the order to bring them more. The result was that the hateful stack was clean eaten up; that it lasted some six weeks, that the sheep throve on it, and the shepherd confessed his sorrow when it came to an end.

Moral of all this:—When you have been obliged to salt an inferior lot of hay, give it time to be thoroughly impregnated with the flavoring. Salt keeps working on in the dark for ages. A wooden floor on which it has been once laid will keep weeping for years. And it so too keeps on extending its influence in the stack. Anyhow the first year nothing would touch it. The mildew was too strong. The second year the flock greedily devoured it. Be it remembered that it had not been allowed to grow coarse and fibrous. It was cut in its succulent bloom, only the weather had washed it at its worst stage.

Another hint, which, after many years' use of the crop, I have only just found. Our useful lucerne crop (Red Sandstone formation), which answers splendidly here, has kept a great stock of pigs, horses, and cows through the straits of an otherwise exceeding hard summer. Our bulls, getting less exercise, got hot and feverish, and broke out (over their thighs especially) with an offensive eruption. We could not make out what it was, and the vet. prescribed wildly, when by the merest accident we found it recorded in White's work that this is a common complaint in France and the Channel Islands, and arises from the lucerne being cut green and wet—that it should be allowed to wither before it is given to cows, and that these should have salt always with it, and some meal. On stopping the lucerne the eruption soon receded. It was our first experience of the disagreeable disorder.

Field Crops.

HARVESTING MANGOLD WURZELS.

As the season for gathering beets and other roots will soon be at hand, we give some English views in regard to gathering and storing mangolds, copied from the London Field:

The harvesting and storing of mangold wurzel is among the most important of farm operations. When a crop shows signs of flagging leaves, either from lack of food or from the attack of fungi, or both, it is as well to put them together as soon as may be convenient; but with regard to those which are still vigorous when frost begins, it will be well to watch the glass and other weather signs, as a few degrees of frost for one or two nights will not greatly injure this crop; and, indeed, we have harvested mangold as late as November, which had been visited by frost so severe as to cause considerable alarm for its safety. If mangolds be harvested in dry days, succeeded by frosty nights, we make a point of never commencing to pull until all frost has been removed from the plants, and then not to take up more than can be conveniently carried before night sets in, as the leaving of roots exposed flat on the ground in a frosty night may cause premature rottenness. If, however, they cannot be carried, it will be well to protect them by spreading the leaves over the roots, either as they lie in rows or in gathered-up heaps.

Our mode of harvesting is to pull them up and place in ranks sufficiently wide apart to allow of the passage of the carts between the ranks, and as they all lie side by side the leaves are cut off with a short hook, or a broken hook does well for the purpose. Here, however, great caution should be used. The workpeople always cut them too close—in fact, they too often cut off the leaves in one bunch, thus taking with them a portion of the crowns. We therefore watch this part of the work with great care, and give directions that nearly all the life-stalk (petiole) shall be left on; and indeed, we are not particular as to leaving whole leaves here and there, as when the roots are caved the leaves soon dry up and act as a convenient packing to the roots.

We find, too, that dirt on the roots soon dries up, so that we are not over-particular to shake all this off before storing; at the same time we confess to a preference for yellow intermediate mangold, on account of its very smooth outline and few rootlets, because it can be pulled with half the labor of the coarser sorts, and will come up so free from dirt that the knocking together to shake off the dirt on pulling is rendered unnecessary. This should be avoided, as it is apt to bruise the skin, and so do mischief; and when these are used they scarcely require cleaning at all, or, if so, it will be of the very slightest kind. In stacking, the first point for consideration will be a convenient site for the ready utilization of the crop. This fixed upon, we choose the least exposed position; if in the field the leeward side—"in the lew"—is chosen; if in a yard, out of the way of cutting winds. Anyhow, too near a public road should be avoided, as they are liable to be stolen at night by some passing carter or other person with a conveyance—"they are so useful for a horse or cow or pig."

We usually place a few roots near the stables expressly for the horses; but, unless you determine to let the horses have them, avoid proximity to the stables, as no carter can resist the temptation of stealing mangolds for his horses if they are placed conveniently for his purpose, and he cannot get them without. "Get mangolds, get them honestly if you can, but get mangolds," is his maxim: nay, he scarcely thinks it dishonest to take the master's mangolds for his horses. Well, when we have decided upon all the conflicting claims for position, a cave is commenced—that is a heap, which we make about four feet at the base, on the bare ground (we do not like pitting, as the bottom of pits may become wet). The roots are neatly stacked in a triangular form at an angle of about 40 degrees, and this is added to for any convenient length.

As the work is carried on the stack is lightly covered with loose straw to keep out frost, and the thatching should be carried out as soon as

convenient; if wet weather seems impending, it will be well to do this work as soon as possible. Our thatch for this crop consists simply of yealmed wheat straw from the threshing machine, or we may use a thatch that has been previously employed on the corn or hay ricks. We never stint in thatch, as when well applied we think it the best protection to the mangold heap. Some of our farming friends prefer to cover over this crop with a plaster of clay; but if this be efficient to keep out the wet, it will scarcely admit of ventilation from the heap. Thatch, on the contrary, keeps out wet, keeps out cold and keeps in warmth, allowing at the same time free ventilation from below. We have always trusted to the thatching alone for protection, and must say that we are never plagued with any extent of rotten roots. We feel convinced that, if stored and protected as we have indicated, this valuable crop may be preserved for many months in the best possible condition.

SUGAR-CANE IN TEXAS.

THINKING a little information on the growing of sugar-cane (Louisiana or Ribin cane) might be of interest to some of the many readers of the RURAL NEW-YORKER especially to those looking around for some paying farm product, one that is always in demand and market never overstocked, consumption on the increase and a large money value grown per acre—I give a little of the experience of one but five years from Illinois:

Selecting southwest Texas on account of its good health and mild climate, as the portions of Louisiana, Florida and other States where the sugar-cane is cultivated, is notorious for being unhealthy, I planted in the fall of '72 and winter of '73 sixteen acres. The following fall and winter I made sixteen hundred dollars' worth of sugar sirup, and had seed cane sufficient to plant forty acres more. The value of seed cane sufficient to plant one acre is fifteen dollars; if the same is manufactured into sugar or sirup it will give twenty dollars worth of product.

The season of '74 was quite dry, July and August exceedingly so, and not more than half a crop of cane was produced, yet the product of sugar and molasses exceeded in value over four thousand dollars, and I sold four hundred dollars worth of seed cane and planted 10 acres more of our own grounds. The winter of '74 was the coldest and wettest known in Texas and the stubble (or ratoon) badly killed. 1875 was notoriously dry and a complete failure in cane crops resulted, yet a tolerable good quality of seed cane was obtained from the fields sufficient to plant sixty acres. This seed, valued at fifteen dollars per acre, gave a thousand dollars.

This season ('76) our summer months have been dry and hot, yet we will make half crop of cane. A good crop of sugar-cane will yield when made up to sugar molasses from three to four hundred dollars worth per acre, and good crops can be insured by irrigation.

We have fine streams of water, never failing, and an abundant supply but it requires some kind of power to elevate the water up to a level with the valley lands. A wind-mill power is sufficient, and our gulf winds are constant at the time needed.

Our lands are rich, no cost (as in Florida) for fertilizers. In this enterprise there is an opening for capital, one that must pay. Seed cane is the most difficult, but in this locality can be had a supply to start with. D. D. B.

Gonzales, Texas.

HARVESTING FODDER CORN.

ONE of the best ways of harvesting fodder corn for fall and early winter use is to cut the stalks in dry weather, then let them wilt a day or two and immediately bind and shock up, leaving the shocks in the field until wanted for use.

The shocks are made larger than one man can conveniently handle, and hence two men are employed for this part of the work. From fifteen to twenty bundles are placed in a shock and set so as to make it of a sound shape. Then the men take out sufficient stalks for the band, lapping them together and twisting them (a man at each end of the band.) The tops of the bundles or shocks are now drawn together and tied with the band, and another band is tied, sound—about midway of the shock—and the work is complete. These shocks can be left standing in the field until required for use when they are hauled to the barn as needed from time to time and fed to the cattle. Fodder corn properly bound and shocked as above described will cure out nicely in the field, and is not injured on account of standing out during the time named. Except perhaps on some of the outside leaves of the shock. The fodder opens clean and bright, and is highly relished by stock. When fodder corn is packed on top of mows and put up in stocks it is apt to heat and become damaged. When it is managed on the plan suggested, a good deal of labor is saved while the crop cures out, and is in better condition for feeding and with less liability of damage and loss. When needed for feeding—three or four days' supply may be hauled to the barn at a time, or in such quantities as may be desired or as convenience shall dictate.

FODDER CORN AS A SUBSTITUTE FOR POOR PASTURAGE.

I HAVE been reading your very interesting as well as instructive paper, and among the many valuable articles contained therein the one relating to the use of Fodder Corn as a substitute for poor pasturage, attracted my particular notice. It is indeed a subject needing especial attention, as an article which should be more extensively used for extra feeding to our cows, especially when pastures are as poor and barren as they are in this locality. My own is I think as good as any will average here in this vicinity and I am positive, should I depend on what the cows might get from that alone, the flow of milk would shrink one-third at least, whereas by my having a fair supply of Fodder Corn to feed from, I have kept my cows up to their usual quantity of milk. I think I am safe in saying better quality and consequently richer butter is allowed by its use than could be, should I depend on pasture feed alone. Trusting that this subject may receive the attention it so justly merits, I am

Respectfully Yours, E. H. FENNO.

Merrick, Mass.

Dairy Husbandry.

BUTTER DAIRYING IN DELAWARE CO.

DELAWARE COUNTY is one of the southern tier of counties of New York and takes its name from the Delaware River, which forms its southwestern boundary. There are two branches of the Delaware that flow in a southwesterly direction through the entire length of the county, the main or "Mohawk" branch taking its rise in Utsyanthia Lake and running through the center of the county. The Susquehannah River also bounds the county on the north, and with the numerous streams flowing into these rivers, it will be seen, the county is remarkably well watered, thus furnishing one of the most important elements for a good dairy region. The surface of the county is hilly and mountainous, being divided into three general ridges by the valleys of the two principal branches of the Delaware. In the south part of the county these ridges form a mountainous region, with high, rocky peaks and wide, narrow ravines. In the north the highlands are less wild and precipitous, but the surface is hilly and uneven, and sometimes quite rugged, the hight above tide-water varying from 800 to 3,000 feet. The soil is generally of a dark, reddish color, composed of disintegrated sandstone and shale. The valleys are often narrow, but the soil is very fertile, being largely alluvium.

BUTTER DAIRYING.

Delaware County is almost exclusively devoted to butter dairying, and the butter produced is of fine quality and has a high reputation in the markets. The grasses are sweet and nutritious, and the character of the county being hilly and undulating, there is good drainage, while the abundance of springs and streams of clear, sweet water give all the requisites for producing good milk. It is claimed that the small percentage of lime in the water also helps to give a better character to the butter product, and that in washing butter the buttermilk is more easily expelled by using soft than hard water. Again, lime, they say, is more or less the source of decomposition, and therefore affects the keeping qualities of the butter. Be this as it may, there is no doubt that Delaware County produces a very choice article of butter.

THE STOCK.

The Jerseys and Jersey grades are highly esteemed in Delaware County for butter dairying. With some a cross of the Jerseys with Short-Horns and Ayrshires is preferred on account of the increased quantity of milk yielded, while the animals are more active and find no difficulty in climbing the hills, the latter being an important requisite which renders thoroughbred Short-Horns unfitted for the county. Devons and Devon grades are also held in some esteem, though for the most part a dash of Jersey blood, either the native or common cows, or crossed with the breeds we have named, is now taking preference among the best butter dairymen of the county. The Hon. WM. YOUMAN of Delhi, who has a small herd of Jersey grades, prefers a cross of this breed with the Short-Horn. His farm is in the immediate vicinity of Delhi, and his milk and butter cellars are models in their way. Recently the "large pan" system has been gaining favor among the farm dairymen and several varieties of pans are in use.

THE McMULLEN DAIRY FARM.

DANIEL MCMULLEN whom we met at the Delhi Fair, has a fine farm of 240 acres about one mile east of Delhi. 100 of which are flats and are devoted to meadows and grain raising—about 40 acres are in timber and the balance of the farm is in pasture. The soil on the flats is a clay loam but the uplands are gravel and red slate. The course of cultivation on the flats is to turn over the sod and put to corn, and the second year a crop of oats is raised and the land seeded to grass. The average yield of corn is about 50 bushels to the acre and that of oats from 50 to 60 bushels. All the grain raised on the farm is fed to stock.

THE COWS.

Are grades being a cross of Jersey and Ayrshire. First the native or common stock of the country is crossed with a thoroughbred Ayrshire bull, and then these grades are crossed with a thoroughbred Jersey bull, and the result is an animal that will yield on an average from 175 to 200 pounds of butter per year. Mr. MCMULLEN says that the average of his whole herd for some years past has not been less than 175 pounds of butter per herd. The cows do not get any grain during the season of pasturage, but as grass begins to depreciate, they are fed sowed corn, and for this purpose from 3 to 4 acres are raised every year. The sowed corn usually lasts from 5 to 6 weeks when the cows go upon the after-feed. Mr. McM. says he has experimented by feeding sour-milk and midlings—say about 6 quarts of milk and 2 quarts of midlings to each cow per day—but he finds as much milk and of as good quality—can be made from sowed corn as from the above.

THE SOUR MILK.

Is now fed to hogs and calves 10 of the former and 15 of the latter being kept. About one ton of corn meal is used in connection with the sour milk, the milk being cooked for the hogs but not for the calves. The 15 calves get from 4 to 5 quarts of meal mixed with the milk daily and in this way very fine calves are raised. Some of the calves this year when fattened have been sold for the New York market at 3½c. per pound live weight, and here averaged $8 per head and upwards.

METHOD OF BUTTER MAKING.

The milk in this dairy is set in Jewet pans and the aim is to reduce the temperature to from 62° to 65 degrees, Fahr. The milk remains in the pans from 36 to 48 hours according to the state of the weather—the less time in hot weather—when it is skimmed. The churning is done in the morning in a dash churn, and the butter washed, worked and salted in the usual manner, and packed in pails and firkins. This year he commenced shipping butter in pails at 44c to 45c per pound and the price run down in July to 30c. Since that the butter made has been held.

A GOOD BUTTER COW.

There were some remarkably good butter cows shown at the Delhi fair, among the most notable of which were the thoroughbred Jerseys belonging to EDWARD EDGERTON of pumpkin. One cow out of this herd 5 years of age, dropped a calf on the 9th of February last, and from the 12th of that month to the 1st of July she gave 3,748½ pounds of milk 13⅛ pounds of which on an average made one pound of butter. She produced during the 141 days 281 pounds and 10 ounces of butter, and her calf sold for $50. Since the 1st of July her average of milk has been 20 pounds per day. The feed of this cow during the season has been as follows: up to the 12th of May she got hay, and in addition 3 quarts of corn and oat meal per day—the mixture being in equal parts. After the 12th of May she was fed nothing but grass. A sister of this cow was also shown at the Fair which has produced on an average, a pound of butter from 15 pounds of milk.

When we consider that a fair average, herd will yield only at the rate of 175 to 200 pounds of butter per herd during the season, the difference between a good and an average cow it will be seen, is sufficient to make an important difference on the profit side of the ledger.

DELHI.

Delhi is the capital of Delaware County and is a pleasant village located in the center of the County, and having a population of about 1,500. The west branch of the Delaware flows through the town. The valley is narrow and on either side are lofty hills. The village shows thrift and the system of providing water to the inhabitants by leading it down in pipes from the mountain, is one of the best in the state. Delaware County furnishes some of the finest flagging to be found anywhere in the State. The quarries are easily worked and large quantities of these stones are being shipped and must afford a considerable source of wealth to the County.

REFUSE HAIR FROM TANNERIES.

A CORRESPONDENT inquires concerning the application of refuse hair from tanneries, and whether it is of value for grass lands.

The refuse hair from tanneries is generally mixed with lime. It is a valuable fertiliser. When spread broadcast, its action is slow but an immediate effect is produced from the lime. The better way to apply hair to land is to pour it under or work it in the soil. The late ZADOCK PRATT of Green County well known for his butter dairying experiments, greatly increased the fertility of his dairy farm by the application of hair and other refuse from his tanneries. He experimented with it in various ways and found the best results were obtained when it was poured in or mingled with the soil. We have experimented with hair for turnips and cabbage, by digging a hole with a spade and putting in a double handful of hair, then covering with earth and planting the turnip seed. The turnips make a great growth, far surpassing that from barn yard manure. It also makes a good manure for cabbages. The waste from tanneries can often be utilized with great profit by farmers living in the immediate vicinity of these establishments and this refuse can not unfrequently be had simply for carting it away.

TIN BUTTER CASES.

MR. X. A. WILLARD: I have your "Practical Butter-Book," and must be indulged in saying that it fills a vacuum heretofore unfilled by any work of the kind known to me. You speak of roll butter being sent to market in tin cases, which seems to me to be just the thing I want. Will you refer me to parties who make such cases. I would prefer buying them of some one with experience in making, to having them made here, even though I might have instructions that would seem plain. SAM. MCRAMSAY.

Vervilla, Tenn.

REMARKS.—The tin cases referred to by our correspondent are not patented we believe and are so simple in construction that any intelligent tinsmith can make them from the description given. We do not know of any parties manufacturing these packages and keeping them for sale. Doubtless some of the dairy furnishing establishments advertising in the RURAL would fill orders, but we should advise our correspondent to have some skillful tinsmith in his immediate vicinity make them to order as the expense of freight would thus be saved.

A NEW CLAIM FOR THE JERSEYS.

DOCT. J. W. WORTH, of Augusta, Mo., says the milk of Jerseys is healthier than that from other breeds. The following is his argument: "For the use of children, invalids, dyspeptics, and fever patients, Jersey milk is preferable to any other, as it is more easily digested, since the butter is proportionately in excess of the caseine. It is an established fact that the portion of milk that a weak stomach finds difficulty in mastering is the caseine; while, on the other hand, butter assists digestion."

The Apiarian.

ON WINTERING BEES.

I WANT a little light on Bees. How shall I winter them? Cellar is too damp, and I am afraid they will freeze out-of-doors. How would it work to move the hives close together in the fall (say six or eight inches apart) and pack straw between them and on the back and top, leaving the front open. Or how would an old ice-house do filled in with six inches of sawdust on all sides and top? It might freeze inside sometimes, but would it not be better than out-doors? Also, are the Italians enough better than the common bees to make Italianizing profitable? And if so, in what respects are they superior? NOVICE.

We have not kept bees of late years, but when we did they were left on the stands all winter. The stands were long, narrow sheds, facing the south, open in front, with one loose board at the back, which was taken down in summer to give ventilation, but closed up tight in winter. If extra protection was required during the cold weather, the front was also boarded up or covered with old sacks.

Perhaps in more northern localities a warmer place is needed in winter, and a neighbor who formerly kept a large number of hives in Northern New York says that his plan of keeping bees over winter was to set the hives in a dry cellar, inverting them and placing a fine wire screen over the bottom to keep the bees from getting out. He says that by turning the hives bottom up, then merely covering with a wire screen, having no bottom board in the hive, ventilation will be secured, and there need be no fear from dampness in a moderately dry cellar.

We think any good, warm outhouse or cellar made above ground would be equally as safe a place as a cellar under a building. Will some of our readers who have had experience in wintering bees in a very cold climate give it for the benefit of those who have not?

The Centennial.

CENTENNIAL AWARDS.

ATLAS HOTEL, Philadelphia, Oct. 29, 1876.

Last night developed one of the most impressive ceromonies which has occurred during the existence of the Great International Exhibition viz; the giving of the awards to the various National representatives or Commissioners. The Judges' Hall was filled with invited guests and happy speeches were made by General Hawley and Director Gen'l. Gosborn. After this the Chief Commissioner of each Government represented was called up and handed a roll containing the awards specially applicable to his country. During the presentation much enthusiasm was manifested by the audience and the representatives of Great Britain and Germany especially received immence plaudits.

As space is limited I can append hereto but a few of the principal awards which may be interesting to your readers. SHORTHORN.

THE AWARDS OF MERIT.

"THE JOHNSTON HARVESTER CO., Brockport, N. Y.—Mowers, Reapers, etc," is the terse way in which the report of the Judges of award expressed the complete triumph of this well-known firm. The above sentence means, in effect, that the Johnston Harvester Co. have scored a signal victory. They have been awarded a grand medal for *each and every machine in their exhibit*, based on their superlative merits, the Jurors of group XXIII considering that the exhibit of this company was so replete with original inventive construction that the entire number of machines displayed were, on their individual merits, entitled to particular distinction. Thus, again, has this company confirmed the success gained abroad and crowned their long series of triumphs by an American prestige that raises them above further competitive trial, *aquilla non capet muscas*.

These awards and medals are given on the merits of the Johnston New Improved Wrought-Iron Harvester, the Self-Rake Reaper, the Combined Mower and Reaper No. 1 (a two-wheel machine), the Combined Mower and Reaper No. 2 machine (also two-wheel) and, finally, their Mower. When the strength, in numbers, of this exhibit is considered, and the fact is emphasised that *each* machine is honored, the extent and completeness of their triumph at once becomes apparent—in short, it is *the*

GRAND SWEEPSTAKES AWARD

of the Centennial. Thus it is demonstrated that the Johnston Harvester Co. again leads the world.

The points of superiority claimed for these machines are simplicity, durability, solidity, ease of draft, practicability, ease of adjustment, adaptation to work successfully in all kinds and conditions of grain, and especially are they celebrated for the thoroughness of their workmanship, the excellence of the materials used in construction and their uniformity, being always found trustworthy when called upon to do their appointed tasks.

The recent awards of the Centennial Commission fittingly supplement the report of the U. S. Commission at the Vienna Exposition to the U. S. Government, made in 1873, and but recently published, from which are taken a few extracts as follows:

The Johnston Harvester Co., Brockport, N. Y., exhibited Reapers, Combined Machines and Mowers. The type of machine manufactured by this firm has many excellent features, the combination of which, together with their good workmanship, tend to make the implements of this company the leading machines in Europe, where they are sold in large numbers. Their chief features are an excellent variety of the Johnston Rake, the arrangement of the driving gear of which is well elevated, etc.

The combined machine was distinguished above other combined reapers by the large size of the two wheels, which support the whole and communicate its motion to the blade. The wheels are of large diameter, made of wrought-iron, and for these reasons, when the machine is worked on a piece of wet ground, they do not sink down unequally on either side—moreover, for this reason, the bevel gear cannot touch the ground and become choked with earth or mud. The reaping apparatus consists of five arms, one more than in other machines, which makes it easier to pull down the grain, and is especially advantageous when there are heavy winds during harvest. The movement of the levers in depressing and raising the cutters to accord with the irregularities of the ground is easily made. The Johnston Combined Reaper mowed its lot easily, rapidly, and the sheaf was equally well made.

The Reaper worked remarkably well. Its motion was easy, without shock, and almost without noise. It was classed No. 1 for cutting rye.

The construction of those machines leaves nothing to be desired. The parts are carefully finished, the bearings are of metal, and the materials employed are first-class. These different machines won for their exhibitor the Grand Medal of Progress, Diploma, etc.

ECLIPSE PORTABLE ENGINE.

PENNSYLVANIA has reason to be proud of her mechanical industries, as evidenced in the success of Frick & Co., Waynesboro, Franklin Co., Pa., makers of the famous "Eclipse" Portable and Stationary Engines. As their name indicates, they have overshadowed all competitors, taking two first awards, each—a Grand Medal of Merit and Diploma; also first premiums at Cincinnati Industrial Exposition, Maryland, Virginia, North Carolina, Delaware and Pennsylvania State Fairs. One of the Centennial awards is on their Portable Engine, based on its work at the test during the Grand Field Trials at Schenck's Station, Pa., last summer, where the competition was conducted in the most thorough and scientific manner. The other is for their Portable and Stationary Engines, combined.

These awards are the more gratifying, as the excellence of these machines has but recently been demonstrated. Their engine is of the horizontal type, constructed on entirely new and improved patterns. A feature of special excellence is the shape of the bed. The cylinder head, bed-plate, guides and both bearings for crank shaft, are in one solid casting. The cylinder and steam chest is also in one solid casting. The various parts, such as piston, pump, crank and shaft, etc., are finished thoroughly. The boiler is made of best American boiler-plate iron, in the style of a locomotive boiler, which secures the largest fire surface and reduces the consumption of coal to a minimum. The boiler is mounted on axles, made of the best refined wrought iron, and by means of strong cast-iron brackets (securely bolted to the boiler), containing spiral-steel springs, carrying entire weight of engine and boiler, thus enabling it to be moved with less risk or injury of any kind over the roughest roads. The weight of the bed-plate of the engine on the boiler is so evenly distributed and ingeniously contrived, that strains of any kind are quite out of question.

THE TIGER SELF-DUMP RAKE.

THE Tiger Horse Hay Rake patented by J. E. Wisner, Friendship, N. Y., and manufactured by J. W. Stoddard & Co., Dayton, Ohio, has taken the Highest Grand Award at the Centennial, consisting of a Grand Medal of Merit and Diploma of Honor.

This rake is so well known that a description of its merits is almost superfluous. It stands before the country as the sum and perfection of years of thought and experiment by Mr. Wisner, and the name "Tiger," is a synonym of its ferocious and vaulting ambition. Mr. Wisner besides being an inventor, is an indefatigable agent, and it has been mainly through his efforts, that the rake is so well known.

The points of superiority claimed for this implement are that it is a perfect self-discharging Sulky Rake; that for simplicity, strength and durability it is without a rival; that for ease of operating or adjusting to any variety of crop or surface it is unequaled; that it is so easy to operate that any boy, or girl that can drive a horse, can rake with it as well as the strongest man; that it rakes clean any kind of hay or grain; dumps from both wheels; has no side draft; and is equipped with twenty steel teeth tempered in oil, which are warranted to stand the severest usage.

The construction of the rake is as perfect, and thorough as the best materials will allow, the axles being improved by the use of solid wrought iron. The spindles are made of the same material. With these qualities to start with, and energy in enforcing their claims to the consideration of the farming community, in addition to the honors above recorded, it may be supposed that the "Tiger" will be refreshed, and growling more lustily than ever, spring forward in the pursuit of increased sales.

FARMERS' FAVORITE GRAIN DRILL.

Two Grand Medals of Merrit and Deplomas of honor were awarded Messrs. Beckford and Huffman, Macedon, N. Y. on their Farmers' Favorite drill.

1st. The Grand Medal highest and only award made to a grain drill with fertilizer attachment.

2nd. Grand Medal and Diploma highest award upon grain and seed drill combined. The First American drill with fertilizer attachment was built by this house thirty years since, and they to-day reap a deserved reward in the prominent distinction given their "Centennial" Farmers' Favorite.

The claim made and substantiated by the tests of the jury of award was "*Uniformity of distribution*" in all positions, lacking which, no success could be attained.

The Superior drill manufactured by Messrs. Thomas Ludlow & Rodgers of Springfield, Ohio. is built under the same patents and is practically the same drill differing only in name—both Houses using by stipulation the same drill in the tests at the Exposition.

THE BUCKEYE AWARDS.

THE Buckeye Harvesting Machines received Four Grand Medals of Merit and Four Diplomas of Honor. The Medals and Diplomas are the highest awards given in the class to which these machines belong.

One Medal and Diploma were awarded to Aultman, Miller & Co. of Akron, Ohio, for the improved Buckeye Reaper. Two other Medals and Diplomas were awarded to C. Aultman & Co., of Canton, Ohio, one for the Miller's New Table Rake Reaper which was fully described in the RURAL's report of the Field Trials during the month of July last, and the other for the western Buckeye Mower. Still another Medal of Merit and Diploma were awarded to Adriance, Platt & Co. of Poughkeepsie, New York, on their New Model Buckeye Mower. In addition to all these awards and in connection therewith perhaps it would be as well to say that the last mentioned firm have just carried off the highest award of Merit at the New York State fair and the First Premium of the New Jersey State Fair for their new Adriance one-wheel Self Rake Reaper, (Brown's patent). Thus it will be seen that the Buckeye still maintains its position in the foremost rank.

FOUST HAY LOADER.—One of the comparatively new implements for lightening the labor of the farmer is the Foust Hay Loader, manufactured by Stratton & Cullum of Meadville, Pa., and exhibited at Agricultural Hall and the Field Trials of the Centennial Exhibition. It did its work so well and gave such perfect satisfaction to the judges that they awarded to it the Grand Medal of Merit, and additional thereto, gave the manufacturers a Diploma. This was a well-deserved award, and was given only upon the thorough test and complete trial which it underwent in the presence of the judges and a large concourse of spectators on the grounds at Schenck's Station. This award places the Hay Loader among the successes of the age and assures its standing among the agricultural purchasers as a machine fully up to what is claimed for it.

PERRY'S NEW YORK HAY TEDDER.—This machine, patented by Stuart Perry of Newport, N. Y., and made by O. E. C. Gulich, Utica, N. Y., was awarded the only grand medal of merrit and diploma in this class of implements. Some of the principal points of excellence claimed for this Tedder are as follows: It never winds itself up or clogs when properly used; it teds back of the wheels as well as between them; it adapts itself to the ground surface; is light on the horse; is perfectly balanced; has large ground wheels; runs very easy; has strong and perfectly true gear; has but few joints and wearing parts; runs thirty-two tines; is safely set low to reach the bottom grass; lays the grass up light and uniform; is easily and safely managed by boys or hired men; has a great adjustability of range; teds at turns and covers the same as elsewhere; is a very simple and durable machine.

BOOMER & BOSCHERT.—When the Centennial awards were made public, it was found that the Boomer & Boschert Press Co. had received three Grand Medals for their Power Cider Press and Apple Mills. In addition to this, and as a further distinction, they were awarded upon this same Press and Mills three Diplomas of Merit. Where the competition is as active as it has been at this Exposition, such a distinguished award should be an assurance to the public at large that these implements are not only what their manufacturers claim for them, but are, in all improvements, quite up to this progressive age of invention and ingenuity. One has but to examine the Cider Mill, the subjects of these awards, now in full operation in Agricultural Hall, to understand the justice of their distinction by the Centennial Judges.

BALDWIN'S AMERICAN FODDER CUTTER, manufactured by C. Pierpont & Co., New Haven, Conn., was awarded the Grand Medal of Merit and Diploma. These cutters have been long and favorably known as machines which will always do the work claimed for them and this award of the Grand Medal now places them before the farmers as the best in the market, having received the commendation of such eminent judicature as the Judges appointed by the Centennial Commission.

THE OSBORN SULKY PLOW, attachment patented by Mr. O. Osborn, and manufactured by Gregg & Co., Trumansburg, N. Y., has taken the Grand Medal and Diploma of Honor conferred by the Centennial Commission on the recommendation of the Jurors of group XXIII.

This machine was first patented in 1869 but not put upon the market until 1870. It claims to inaugurate a radical change in the manner of plowing. Any ordinary right hand plow can be used with this attachment. The adjustable axle can be raised, lowered, or tipped in either direction at will, throwing the plow on the mold-board as is done by hand. In stony or hard land its advantages are most apparent.

HEEBNER'S PATENT LEVEL TREAD RAILWAY HORSE POWERS, made by Heebner & Sons, Lansdale Pa., have gained a first award and Grand Medal, which is a well-deserved compliment. This machine was exhibited at the Grand Field Trials at Schenck's Station, Pa., last summer and was there subjected to thorough tests, under the supervision of the most experienced Foreign and American experts.

The principle points of superiority claimed for the power, are a patent governor which perfectly controls the Tread. A Level Tread sustained on large wheels that run over reels at both ends of the track; obviating pounding, clatter and loss of power.

THE BRADLEY MANUFACTURING CO. of Syracuse, New York and Chicago Ill., received Four Awards, consisting of Four Grand Medals of Merit and Four Diplomas of Honor, being the highest awards in this class and prove the character of the machines for which they were given. There was one Medal and a Diploma upon their New Self Rake Reaper, another on their New Mower, still another on their Self Dump Hay Rake and yet a fourth upon their Patent Cushioned Hammer. The Medals and Diplomas upon the first three were given after their submission to the Severe Field tests at Schenck's Station last summer in the presence and under the direction of the Judges on Agricultural Implements.

THE ARCHER RAKE—made by Clegg, Wood & Co., of Dayton, Ohio, received the Grand Bronze Medal of Merit and Diploma of the Centennial Exposition. The principal points of superiority claimed for this Rake are its simplicity, durability, and that it is the only self-discharging rake operated without gearing, friction or springs.

U. S. CENTENNIAL COMMISSION.

PHILADELPHIA, Sept. 28th, 1876.

EDS. RURAL NEW-YORKER:—The Autumnal Display of Butter and Cheese is fixed for Oct. 17th to the close of the International Exhibition, Nov. 10.

I beg to call your attention to the more favorable circumstances now existing than at any other period since the establishment of the Butter and Cheese Building. The temperature is now all that could be desired, the structure is in good order, and the attendance of visitors is growing to immense proportions. The Building is no longer deserted, because of its isolation, but hourly crowded with Agriculturists and other interested parties attracted by the inscriptions on its sides. There is yet quite time to make a display unsurpassed by anything ever before presented. The generosity of the subscribers to the construction of the building demands recognition and support, and the public expect an exposition of the products of the Creamery and Cheese Factory as well as of the plow, the loom and the anvil. Yours Respectfully,

BURNET LANDRETH,
Chief Bureau of Agriculture.

CENTENNIAL LIVE STOCK EXHIBITION.

WESTMINSTER HOTEL, Phila., Sept. 28, 1876.

In the recent Horse Show, held under the auspices of the Centennial Commission, was not, in extent and quality, what it should have been—to worthily represent the equine family of the United States of America—such cannot justly be said of the cattle show now in progress on the Live Stock grounds of the Centennial exhibition. Not only does Canada compete—and she does so, highly to her credit—but England has sent across the ocean some of her most choice herds. The quality of the animals now under review is wonderfully good for so numerous a collection, being just 460 head, according to the official catalogue.

The various herds comprise English, American and Canadian Short-Horns, home-bred and imported herds from the Channel Islands, Herefords, Devons, Black-nosed and Sheeted Ayrshires, Holsteins and Gallowys, so called here, but, to my view of the matter, rather should these latter be named Black Angus. There are also some good specimens of draught oxen and a few grade animals; again there are steers and heifers, monsters of fatness and inutility, save as advertisements for human folly, and the flesh and adipose producing powers of cattle fodder.

Before I enter into any individual details of separate herds, a word or two in general of the varied excellences of races and families would save repetition. Thus the Short-Horns or improved Durhams are essentially a beef-producing

family, that, by a perversion of good judgment, some breeders have, by persistence in wrong-doing, caused to improve in their milking qualities; but then these same herds have invariably fallen off in beef-producing power. A bovine family, equally excellent in all valuable qualities, is not to be found, no more than a horse for general purposes which is expected to be endowed with all of the most choice attributes of horse flesh. In the human family one individual is rarely, if ever, blessed with a combination of glorious talents. The greatest among us can stand out pre-eminent in one, mediocre or nothing in most others. Therefore, no breeder of sound judgment ought to seek to pervert nature. His aim should be to aid her by selection of the best; and that the owners of herds now here are alive to this fact is in the aggregate easy to be seen.

The pretty herds of Channel Island cattle number among them some animals of surpassing beauty. These little cattle are great milkers, both in richness and in quantity. As beef-producers they are of small value, the bone being light and the structure altogether too fine to admit of room to put up flesh; then their individual habit is adverse to an accumulation of adipose cushion. The Herefords are a comely race, their snow-white faces full of docility, their clean cut legs, together with the depth of rib, giving them great lung power, bespeak them essentially useful as draught cattle. The same may be said of the Devons, to which I can add that, being a thrifty race, they are safe to get on well in rough, rocky land. They are active, intelligent animals, and very kind as draught oxen. Some of the Devons run greatly to milk, which, though good, is not to be compared with the milk of the Channel Island cows, be they from Guernsey, Jersey or Alderney. Both Herefords and Devons fatten well; but neither of them put up in proportion the same amount of high-priced beef as can on an equal quantity of fodder be accumulated by the Short-Horn family.

Next to the Channel Island cattle the Ayrshires can be reckoned as good milkers. This family comprises two divisions, the most choice, to my taste, being the Black-nosed variety. The second are the red-and-white, or, as some name them, the Sheeted Ayrshires. These are a tidy, compact race; they thrive where larger breeds of cattle would starve. Though heavier in build than those I compare them with, they are not beef cattle. The Ayrshires, under the influence of high keep, are apt to become coarse. Their very goodness causes this, so much so that careful breeders strive to keep the bone fine and the carcass compact. A small-sized Ayrshire bull, neat and closely put together, is, therefore, the best to breed from. A roomy cow need not be objected to; but coarseness in either parent must carefully be avoided, or else deterioration is certain to follow.

The Polled cattle here are scarce. That is grievous to me, or to anyone familiar with the Spanish herds of Texas, these wretched long-horned skeletons, those lean Kine of Cortes and Pizzaro, that when taken into beauteous Illinois, devour ten times the quantity that would fatten a grade steer, could be rapidly improved by the Polled Cross. The horuless cattle are distinctive in their excellent qualities, effacing, in one cross, many of the bad points of the Texan herds. The British Isles possess three distinct branches of the Polled or Horuless tribe of bovines. Those are the Black Angus, the Brown or nearly Black Galloway, both of Scottish blood and the red herds of Norfolk and Suffolk, England. Some enterprising individuals have, from time to time, braved the perils of ocean travel, have penetrated into Holstein, and from thence have brought out certain huge animals, remarkable for length of limb, development of cranium and generally valueless peculiarities. The admiration of these Holstein herds is a hindrance to the improvement of the herds of America; even when clean-bred they are coarse, and, as feeders, over fond of their grub.

Out of so much assembled excellence it is difficult to select the best, still I have ventured to do so, and my choice is as follows: The Short-Horn herd of B. B. Groom & Son of Vinewood, Winchester, Ky., numbers seven head, and is of rare beauty. The bull, Mariner 2nd, is red. He has rarely been beaten, and took the sweepstakes at Paris, Ky. His next-door neighbor is Oxford, of Geneva, a roan bull, 18 months, full of good points. His sire and dam were exported six years ago and brought back in 1875 with this calf, who took this year's prize in his own ring at the State Fair, Columbus, Ohio. The imported cow, Winsome 16th, cost £1,000 sterling, was bred by his grace, the Duke of Devonshire, and shared all over England the prizes of the hour with that Short-Horn beauty, Queen Mary; she is a strawberry roan. Daisy, bred in Kentucky, is red in color; her many beauties of conformation speak well for the sound judgment of her breeders. She stands the winner of the highest prize awarded in her State. Red Rose 8th baffles description. Her head and neck are lovely in the extreme; her horn fine and waxlike; her temper smooth as her glossy coat; her eyes, like those attributed to Juno, full of liquid light. She is a beauty all over. This herd took seven prizes at the recent Ohio Fair. The remaining animals are Victoria's Gem and Gloucestershire Wiley.

From England has arrived the Short-Horn herd of B. St. John Ackers, Esq., of Triuknash Tork, Tainswick, Gloucestershire. At the head of this herd stands Cymbaline, a white bull, good all over, but remarkable for the fineness of his fore-quarters. He has taken numerous prizes. His companion, Lord Cranham, taken up suddenly from light feed, has a straight back, a long side, a deep rib and plenty of bone to put up first quality beef. The gem of this herd is Clovis, a roan bull. He took the third prize this year at the Royal Show held at Birmingham, Eng. This honor is considered equal to any other first award. This last-named animal is as soft as nunpun silk, and I hope that for the advantage of America he may be purchased to remain in the country. Wedding Day, a strawberry roan, two years and eleven months old, believed to be in calf, is a perfect example of a first-class English Short-Horn. She is long and low and close to the ground; what more need be said? Baroness Pawlett, a light roan, two years old, is wonderful for the fineness of her coat, which is only one of her valuable properties. Cassandra, a white heifer, own sister to Cymbaline, is an unusually neat, close-built animal. The herd in Merrie England numbers 60 head, of which six are here. These are chiefly of Booth blood. Wedding Day is pure bred of that strain.

Mr. Ackers has likewise sent over three pure-bred Berkshire pigs (one boar and two sows), one of which has with her an interesting family of five bonnives. They all have taken prizes in England and Scotland.

Among the Channel Island cattle the herd exhibited by Mr. Crozier of Northport, L. I., pleases me the most. They are Jerseys, and are headed by the bull Cossack, Herd Register No. 1,159. Cossack is by Clement, progenitor of the Long Island Jersey herd. He is fawn color, with black joints, and has a beautiful head. Josephine 2d, in Herd Register No. 3,296, is actually perfection for a Jersey cow. She is of a deep orange color, and the inside of her delicate, transparent ears is also orange-tinted. Belle Hinman is the daughter of a cow which made her own weight in butter in one year. Josephine Beacon is now making nine pounds of butter per week. Fanciful, a two-year-old heifer, is nearly as lovely as Josephine 2d.

Mr. Crozier also exhibits six head of Ayrshire cattle—one bull and four cows of the black-nosed variety and one cow of the sheeted or red-and-white family. The bull, Duke of Charleton, bred by D. F. Curtis, is very rich in color, long and even, much like a Short-Horn in his lines. One of the cows, Maggie Stewart, though now milking fourteen months, still gives eight quarts per day and is to calve again in six weeks. She is large of her breed. Ruby, a red cow, bred in Scotland, where she took several prizes, is deer-like in head and legs, with a muzzle fine as that of a race-horse. Nellie Biddle, a Sheeted Ayrshire, imported quite recently, dropped her calf on board ship and has since done well. She is a good specimen of her variety, though to me not so admirable as are her black-nosed cousins. The last of this herd is Maggie Anderson, also bred in Scotland, and imported by her present owner.

In the Devon class, O. B. King of Connecticut exhibits a choice herd of eight head—one bull, five cows and two calves. Mattons Lion, cherry red, excellent in color and form.

Of the Herefords, J. L. Miller of Beecher, Ill., has, to my taste, the best on the ground. His herd numbers thirteen head—two bulls, one bull calf, ten cows and heifers. The two bulls, Success and Royal Briton, both imported, the latter in the dam, are half brothers. Their dam, Dolly Varden, is a most charming animal. She is six years old, has had four calves, and is now again in calf. Of this herd the two three-year-old heifers, Grace and Katie, have been bred in America. They are very handsome and unusually even in quality.

I must now say a word or two about the Canada part of the Show. The arrivals from across the border number from sixty to sixty-five head and comprise among them much that is good and valuable. Taken in herds they are as follows:—Three herds of Ayrshires, one herd of Alderneys, one of Herefords, and one of black-polled Angus cattle, which the man in charge persisted in calling Galloways; but be they Galloways or Angus, there was one bull of the lot a credit to his owner. Mr. George Hood exhibits three bulls respectively aged two years, one year old, and a calf, also one heifer calf. The head of the two-year-old bull is better than the head of Mr. Miller's bull, with which he competes, Mr. Hood's stock being also Herefords. I failed to find any person of a communicative turn of mind interested in the Canada herds; even to discover the names of our excellent neighbors was as difficult as to decide the uses or abuses of the round towers of Ireland. This is deplorable, as Canada has done well. The black-polled bull, Major, is a superb type of his breed, and the cows of his herd are good. They, in their class, defy competition, at least successful competition. Mr. W. Miller exhibits three Short-Horns. His cow, Necklace 7th, is a dangerous rival for Mr. Groom's beauties. Mr. W. M. Telfor has on show six Short-Horns, two bulls, two cows and two calves. The bull, Third Duke of Kent, is nine months old, of a dark mahogany red color, and is just as good as his age could produce. He stands in a box with his dam, the Duchess of Kent, a strawberry roan, two years old. She has a beautiful face, full of intelligence and gentleness.

Regretting that I could not obtain more information relating to the Canada herds, and fearing to trespass over much on your valuable space, I conclude, being well content with the Centennial Cattle Show. M. M.

The Poultry Yard.

CHOOSING FOWLS FOR TABLE.

It is a little singular that taste or fashion as to the color of the flesh of fowls varies at different large markets. In the London market yellow-skinned birds are not sought for, the pink or flesh-colored skin being the favorite there, while in New York the yellow is preferred in a marked degree. The questions naturally arise, What is the reason for this difference in taste, and which are the best for the table as to flavor, delicacy, etc.? There is no doubt that those fowls that are celebrated for their peculiar richness of flavor and delicate flesh mainly belong to the *pink*, or as some people call them, the *white* skinned varieties. This is conceded by all authorities. Such fowls are the Games, Houdans, Dorkings, etc. Perhaps the reason for the preference for yellow in New York is that a proper discrimination is not made between the pink and *dark* or *blue* skinned fowls in choosing fowls for the table, the latter of which are generally poor in quality, such as Spanish Hamburgs, etc. Another reason may be that all the pink skins are very tender to dress, tearing easily, and extra care is required in dressing to make them look attractive, and if they come from a long distance and are at all damaged they do not present as clean and nice an appearance as those with yellow skins. H. H.

KEEPING POULTRY.—No. 9.

Feeding is the next point that claims attention. Many an amateur will be sorely puzzled at the advice given him by most of his poultry books; some such phrases as these constantly occur: "Give your birds a liberal supply of good wholesome food." "Keep your fowls well supplied with plenty of corn, and soft food once a day." "The quantity and quality of eggs, depends greatly on the feeding," etc., etc. After reading many such items of advice the beginner earnestly intends to stuff his fowls with a variety of food, such as he sees recommended, beef scraps, ground bone, corn, wheat, buckwheat, boiled rice, oatmeal, potatoes and *tonics* to give them appetite.

He begins to feel proud of his own intended generosity. But, he sees in another page of the same book, or another work, that he "must not over-feed his stock if he would have them lay plentifully." "Over-feeding will make hens fat and lazy, and stop their laying, sometimes killing them." Now here is a dilemma, and how can one tell when a fowl has eaten enough or too much? Some say, fowls that have corn always before them will *not* eat so much as when it is thrown to them once or twice a day, others say that "when they have all they can eat, with corn left always before them they will get so fat as to be useless for breeding."

I have never yet seen those conflicting statements qualified so as to be useful. The fact is, all such advice on feeding depends very much on the *kind of fowls* one keeps. Whoever heard of a game bird getting so fat as to be useless except for the look. The same may be said of Hamburgs and Leghorns. Such breeds as these are so full of life and activity that they seldom get very fat, while all the Asiatics, fed as much as would keep the active breeds in good condition, would get much too fat. I have had Light Brahmas, kept and fed with small breeds get so fat, that when killed the fat on the intestines and offal of one bird weighed fully two pounds; while the lively varieties were simply in good condition.

Asiatics and other kinds do not do well confined together. The former will get too fat with the same feeding that is required to keep the latter in condition. If running at large and fed on the ground twice a day, so much as they will eat up clean and no more, they do well enough. The more active birds will hunt up dainty morsels, and insects to keep them in health. If oats, rye, or buckwheat is left before them so much the better; fowls will not often fatten too much on these. But never leave more corn than they will eat up clean.

In winter when the stock is confined I always keep oats or buckwheat and sometimes wheat in a hopper (so that they can get at it whenever they like), and feed with soft food at noon and corn or wheat at night. Fowls can be over-fed or rather *pampered*. This is what is meant by the cautions against over-feeding. It can be done by giving them all the corn they can stow away, and leaving some, with (perhaps) two or three other kinds of grain, meat or scraps, bread and other soft food in addition, tempting them to eat too much. Such pampering will make the best fowls in too high condition, they will not continue long in health under such treatment; a reaction will take place sooner or later, causing apoplexy, choking of the heart, stoppage of the egg canal, &c.

The beginner is now supposed to be fairly started, with his beautiful pets in their new quarters, in bright health and spirits, prating, scratching, crowing and doing many other wonderful things, to the delight of their owner, his family, and all welcome visitors. H. Hales.

WHITE LEGHORN FOWLS.

I am an old reader of your valuable paper, and for some time a subscriber, not a correspondent however, but as I take a lively interest on the subjects therein discussed, I will give you my experience of some years with white Leghorns, which was suggested by the answers—5 and 6—of Mr. A. M. Van Auken, in your issue of September 23d to "questions about poultry."

My fowls lay when eight months' old, and under conditions more favorable than I can give them, will lay much sooner; they continue to lay profusely through the entire winter, and until they molt, seldom stopping longer than a few days when in condition. My yard has a fence seven feet high around it and I find that all I desire without roofing.

It is true that about three Leghorns can be raised on the grain consumed by one Brahma, but I cannot agree with your correspondent, that the Leghorn when grown eats as much in proportion to the number of eggs laid, as the Brahma. The latter breed is a large feeder, and an inveterate sitter withal; when in that condition, if not desired to sit, weeks are wasted ere she resumes laying, and thus the Leghorn gains largely over her to the profit account.

The Leghorn, being a non-sitter, is almost a perpetual layer of really handsome good sized eggs, which, moreover, command a readier, if not a better market than those from Brahmas; her meat is most excellent, she does not carry it as abundantly as her supposed rival, it is true, but it would be marvelous, indeed, if she did and outdo the Brahma in all other respects. Yours truly, J. De Soto.

Fordham, N. Y.

Correction.—Will you please make the letter on coming exhibition read: "There are many worthy societies at whose fairs they make a point to make all happy, and their officers know well how to do it," which it was my intention to say, if I did not in my article in the Rural of Sept. 9. —A Subscriber.

Entomological.

ABOUT THE HOUSE FLY.

Will you, through the columns of your paper, tell me if the common house fly performs the same metamorphoses that the green fly which produces the maggot found in spoiled meat? and if it does, do they increase in size after they become a perfect insect?—James E. Munger, *Genesee Co., N. Y.*

The common house fly passes through the same number of metamorphoses as the "meat fly," and is "born" full size, coming from the chrysalis fully developed; and there is no increase in size afterwards, except as the abdomen of the female may become slightly distended with eggs. It is a very common remark among housewives that if they kill off the little flies appearing in early spring, they will prevent their growing into larger ones later in the season. But this is an error, for the little flies are a distinct species and do not develope or grow any larger than when first seen. "Kittens grow to cats, but mice never turn to rats," is an old saying, but mice and rats are as near related and as likely to "turn one into the other" as little flies are to become big ones.

Exterminate Caterpillars.—To exterminate caterpillars on trees, they may be sprinkled with a solution of one part of sulphide of potassium in 500 parts of water. This, it is said, will kill the insects, and do no harm to the trees.

Floricultural.

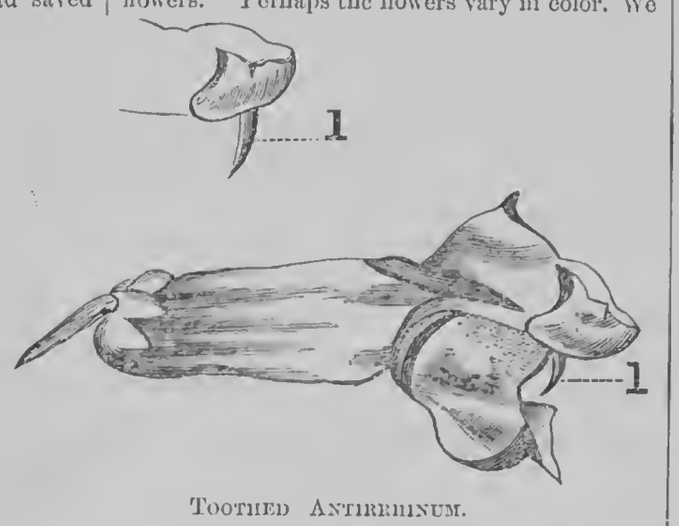
A LITTLE ANNOUNCEMENT.

Last year it was stated in the Rural that seeds of Hardy Phlox, saved from a collection imported from England, would be forwarded to Rural subscribers upon the receipt of a stamped and directed envelope. Though we had saved seeds enough, as we supposed, to supply the largest demand which was likely to follow, the supply was after awhile exhausted, of which fact pains were taken to notify our readers. Afterwards many letters were received requesting seeds for next (this) fall. All of the writers' names were recorded as received and the seeds will be sent accordingly as soon as ripened,

For this fall we offer upon the same terms seeds of the following plants:

1st. Dwarf *Antirrhinum*. Our seeds were imported last year from Mr. B. S. Williams, London, Eng. Though we had cultivated Antirrhinums for ten years or more, with a view, for a part of the time at least, to improving them, some of the flowers from Mr. Williams' seed are the largest and brightest we have ever seen. The following are the colors which will be mixed in each packet: White and lemon distinctly blotched, striped and speckled with crimson. White tubes with crimson, pink and orange lips. Tubes and lips of the same color (or selfs), maroon and crimson.

The accompanying sketch was taken both to show the size of the flowers and also a peculiarity of those of one plant, viz., having upon the upper lip a spur or tooth, as shown at 1—1 in the engraving



Toothed Antirrhinum.

2d. Chater's Strain of Double Hollyhocks. Among several of these was one of a dwarf habit, bearing immense racemes of lemon-colored flowers as perfectly double as it is possible for a hollyhock flower to be. It is from these that our seeds have been saved.

3d. *Zinnia Darwini* has been several times referred to in these columns. From its praises abroad, as well as on account of the absurdly high price charged for a half-dozen seeds, we had anticipated a marked improvement upon the common *Z. elegans*. It is true, however, this season has not been one during which the merits of any new flowers ought to be judged.

4th. Green Gage Tomato. A part of the Rural grounds is devoted to the testing of new vegetables as they are introduced. Among those cultivated the present season, the above Tomato —an English novelty—impresses us favorably. Two tomatoes ripened August 15, the larger measuring seven inches in circumference. They were perfectly smooth, without a furrow and of the shape of an orange. Many of those ripening later were much smaller and of an oblong shape, from which and from the color—a bright yellow—the name, we suppose, was suggested. The smaller are excellent for preserving, the others very good either raw, cooked or for making catsup. All of them are firm, but two-celled and small-seeded. Trained upon a trellis this Tomato is quite ornamental after the fruit begins to ripen.

5th. *Pelargoniums*.—A year or more ago a serial account was given in these columns of crossing Pelargoniums. From the seedlings there referred to we have before and since been selecting the best of the plants, throwing the others away. From the best of those remaining (about 100 plants) we have selected our seeds.

Now we will forward a few seeds of any two of the above mentioned plants to any Rural subscriber whose name we find upon our books and who cares enough for them to forward to the Floricultural Editor (or F. R.) a stamped and addressed envelope.

MISCELLANEA.

Nymphœa odorata.—The Pennsylvania Railroad, along its winding course to the Centennial, passes through or over several ponds, in which this fragrant and lovely nymph of the waters is quite abundant and now (Sept. 20) in bloom. At several of the stations they are offered in bunches for sale.

We have tried repeatedly to start *Nelumbium luteum* in a spring-water lake, averaging four feet in depth, with precipitate banks, both by seeds and roots. We have also tried seeds of *Nymphæa odorata*, without in either case having been successful in a single instance. We conclude that they do not like spring water.

Hydrangea quercifolia.—Mr. W. B. Hemsley gives, in the London Garden, Sep. 9, quite an exhaustive account of Hydrangeas. He says of this species that it is a native of Florida and scarcely hardy in any part of this country (England).

It stood in this latitude, winter before last, over 20° below zero, and it would be unaccountable if not hardy in any part of England.

Its fine, large foliage, resembling, as Mr. H. says, more the leaves of a Plane than of an Oak; its terminal cymes of greenish-white flowers, more the shape of Lilacs than of other Hydrangeas, blooming in mid-June, render it an attractive object, either alone or in shrubbery borders.

Mr. Hemsley says: "Bartram, who first described this species, says that it has *crimson* flowers." Perhaps the flowers vary in color. We have never seen or heard of any with other than the color mentioned above.

NOVELTIES.

A new Lilac.—M. Lemoine has raised a double-flowered Lilac, which he has named *Syringa hyacinthifolia flore-pleno*. He applied pollen of one variety upon 100 flowers of another, obtaining, in the first instance, but seven seeds. *S. oblata* and *azurea plena* were the varieties used. Other efforts were somewhat more successful. He has raised forty plants, of which number but three have bloomed, one of which is the above. The flowers resemble those of very small Hyacinths, hence the name. We have an abiding faith that the Lilac is susceptible of great improvement, and that it will, in the not distant future, be prized as it has been in days long gone by.

Cedrella Sinensis.—The Gardeners' Chronicle of England says that at a recent meeting of the Academie des Sciences (Paris), Prof. Decaisne exhibited a flowering branch of *Cedrella Sinensis*, an exceedingly ornamental hardy tree, resembling *Ailanthus glandulosus* in habit and foliage. Being a native of the North of China, it is perfectly hardy in the climate of London, and from the descriptions of it in French journals, it is a great acquisition to the small number of hardy trees with pinnate leaves. The white flowers are small but numerous, and borne in erect panicles, often more than 18 inches in length. Some parts of this tree are said to possess something like the flavor of Garlic and to be used by the Chinese in cookery.

NOTES.

A writer in the *Jahrbuch des Bremen'schen Gaatenbau-Verin*, on the "Change in the Colors of Flowers," says that the changes in the colors of the flowers of Gladiolus versicolor are among the most remarkable and wonderful of this class of phenomena. Indeed this plant may be dubbed a vegetable chameleon, so varied are the changes the colors of its flowers undergo. In the morning they are brown, and during the day they assume various hues, until in the evening they become blue, and remain so during the night; the following morning they are again brown, and during the day they pass through the same changes as on the preceding day.

Correction.—M. J. Wills of Oregon, Mo., desires us to state that it is *Lilium auranticacum*, not *L. auratum* offered under "Exchange" in Rural of Sept. 2.

The Garden.

EARLY VEGETABLES FROM FALL SOWING.

There are a number of kinds of garden vegetables which may be secured for early spring use by sowing the seeds in the fall. The first requisite is a very rich soil, and one that is deep and naturally dry, or has been well drained artificially.

SPINACH.

This excellent and much-esteemed vegetable is generally started in the fall, the seed being sown early enough to secure plants with leaves an inch or more in diameter before cold weather sets in, or the plants may be grown large enough for use in the fall, then by giving a protection of straw and hay, one may cut a supply during every thaw until spring. But for an early crop, and for home use, it is not best to start the seed too early, but merely get the plants well established before cold weather, then cover lightly with some coarse litter—swamp hay being preferable to straw where field mice are abundant. The round, smooth-leaved spinach is the best for fall sowing, as it is more hardy than the long-leaved sorts.

CABBAGE AND CAULIFLOWERS.

For an early spring supply, the seeds should be sown early enough in the fall to obtain plants two or three inches high before freezing weather. The plants may be protected by being heeled-in out in the open ground and then covered; but the better way is to put them into frames where a little light and air can be given occasionally during the winter. Care should be given to have the plants well hardened, as the gardeners call it, before severe freezing weather comes on. If grown in the open air, there will be little danger of the plants becoming tender through rapid growth, as the cool nights will check over-luxuriance.

BRUSSEL SPROUTS.

This is another excellent early spring greens, the seed being sown in the fall, sometimes as late as October, and the plants protected during winter the same as spinach. "Sprouts," as this plant is generally termed, are extensively cultivated in the vicinity of New York, and immense quantities brought to our markets early in spring.

LETTUCE.

There are few persons who do not enjoy a crisp lettuce salad in early spring, if not at other seasons. Those who have good hot-beds can, of course, bring along their salads long before the cold weather is past; but persons not having such conveniences, may forward the "season" considerably by sowing their lettuce seed in the fall and then protecting the plants with a light covering of bog hay.

The varieties known as the Black Seeded Butter and Brown Dutch are probably the most hardy, and withstand the cold of winter with very slight protection, and come forward very rapidly at the approach of warm weather in spring. Those who want a supply of early vegetables next season should make preparations for the same this fall.

Scientific and Useful.

SERICULTURE IN ENGLAND.

There are probably few of our readers who have any idea of the vast amount of money annually expended for the eggs of the little moth producing silkworms. These eggs are called "grain," for they have the appearance of some of the smaller grains or grass seed, being about the size of common millet. Many of the readers of the Rural New-Yorker doubtless think, (if they think about it at all), that those who raise and feed the worms, should be able to raise moths enough to produce all the eggs required, but the experience of sericulturists shows such a supposition is erroneous to a great extent, and the old saw of not "counting the chickens before they are hatched" is quite as applicable in this silk industry as in many others. Numbers of our poultry men have learned to their loss that there is a disease, known as Chicken Cholera, which sometimes sadly interferes with their plans and estimates of final results and profits, and the raisers of silkworms have a little disease to contend with in raising these useful insects, hence it becomes necessary to procure fresh eggs from healthy stock almost every year, for in many districts in Southern Europe where the silk industries have for generations been the principal occupation of the inhabitants it has of late years been impossible to raise a healthy progeny from the home bred moths.

To give up and abandon the silk industries in these districts would be a fearful blow to the inhabitants thereof for their lands are planted with Mulberry trees, upon which the worms are fed, and buildings erected in which to rear and feed them, besides the various other apparatus and machinery required are all on hand, and what is most the skilled labor is there, ready and waiting to be used. Owing to the presence of the disease referred to immense quantities of grains, (eggs) have for several years past been imported from Japan, coming to San Francisco thence by railroad to New York and here re-shipped to France or other European ports. Very fair success attended this enterprise of importing these eggs, but now it is reported that the same disease which has been so destructive to the worms in Europe has broken out in Japan which, if widespread, will prevent any further supplies coming from that source.

Under these circumstances it is no wonder that silk has lately advanced in price, and our scientists begin to seek remedies for this great evil, or new sources of supply. We shall probably have occasion to refer to this subject again, giving the results of some experiments conducted for the purpose of eradicating the silk-worm disease, but in the mean time we copy a very interesting article on this subject by Alexander Wallace, M. D. in the London Garden, wherein he advocates the raising of the grains in England by the aid of artificial heat when necessary. If it can be done in England with profit we see no reason why it cannot be done here without such assistance. There must be somewhere within our vast range of territory and climate regions of country where the silk worm can be reared in health.

Doctor Wallace says that having experimented in Colchester during the past fifteen years on all the known varieties of silk-worms, with the view of their introduction into England and its colonies, and having ascertained, by actual experiment, that the most profitable race was that of the Bombyx Mori, and that the growth of the white Mulberry tree and the cultivation of its silk-worms were easily accomplished in the greater part of the English Isles, it has given me great pleasure to read a letter from Mrs. Neile, who has done so much for Mulberry silk culture in Australia, advocating the cultivation in England of "grain," or the production of eggs of the best races of Mulberry silk-worms for sale in Southern Europe. As I believe the main features of the case are unknown in England, and as the introduction of a new industry, so easy and simple to carry out, yet so lucrative in its results, will be hailed as a boon by all friends of the British farmer (who now finds himself unable to compete with the world in the growth of cereals, and liable to sudden and heavy losses from disease, &c., if he venture on breeding or rearing stock), I crave the indulgence of a few lines to explain the position in which this country stands with regard to sericulture, and to indicate what may reasonably be expected to be effected if the matter be gone into with prudence and perseverance.

When I found out some ten years ago that about £1,000,000 sterling was annually sent from Europe to Japan by those interested in sericulture to purchase fresh, healthy "grain," their own stock having been either worked out or enfeebled by disease, it occurred to me that some of this money might be diverted to this country to enrich our own people. I found that several scientific Frenchmen of eminence—notably M. Guerin-Menneville, Government Inspector in France—had been very favorably disposed towards "silk," or rather "grain" culture in England. I found that on the borders of Hampshire and Surrey Captain Mason had for years grown the white Mulberry tree, and produced silk which had been exhibited with first-class honors. My first trials at Colchester, being dependent on bought or borrowed Mulberry leaves (an uncertain supply), were not very successful. Having now got a good supply of white Mulberry trees in thriving condition (about 2 acres are planted out), my experiments during the last two years have been very successful. I have had shoots on these trees which in one year grew from 5 to 6 feet long. I have educated and fed the worms, derived from one of the best sources in Europe, in a room, almost without disease and almost without fire in June, July and August, and have produced both years a small lot of fine grain, the parent cocoons of which have been pronounced excellent by good judges.

Moreover, the introduction of several new kinds of stoves, which produce a high temperature in the silk-worm room without giving off any deleterious gases, gives us these great advantages—that the education of the worms is most rapidly hastened, reducing the period of the caterpillar stage from six to three weeks; they render the cultivation of the worm independent of any weather; and no carbonic acid or other noxious gas is given off to injure them. In the words of one of the inventors, Dr. Carret, "Healthy silk-worms can by means of these stoves be educated in any country where the Mulberry tree grows, independently of the weather." Therefore, the education of Mulberry silk-worms in England ought to be an assured fact. I wish, however, to correct a prevailing misconception. The ordinary silk-worm, such as obtained in Covent Garden, being an Indian (Dasee) race, producing the yellow or white-pointed cocoon, is for commercial purposes useless; the cocoons do not produce sufficient silk.

The most paying product in silk-worm culture is that of good grain or eggs, and evidence of the quality of the parent cocoon is always required before eggs can be sold in silk-growing countries. Hence the best races free from disease must be obtained, or those who wish to take up sericulture will be disappointed in the result. The old Brienza race, regenerated by Mons. Roland of Switzerland, exhibited in the International Exhibition of 1873, is the best now extant in Europe, and the one which I have reared in England with success. Lastly, any person going into the subject must be prepared during the months of June, July and August, to devote much time regularly and constantly every day, as the worms require close attention, or the result will be worthless.

Now as to the commercial results, Japan, as a grain-producing country, is now worked out.

All her best grain has been exported to Europe, and last season the purchases of grain did not amount to one-eighth of former sales. The South of Europe can take from us instead of from Japan, a million ounces of eggs, if we can only produce them, at a price of from 15s. to 21s. per oz. of 30 grammes, and will be very glad to get eggs, if only healthy, from us. If properly managed, 1 oz. of eggs will produce in grain 100 oz., or £1 will produce £100, leaving a large margin for profit after all expenses have been paid, but generally half that result will afford a splendid profit. The education may be effected by women and children, if only the leaves be collected by a man. The Southern, Midland, and Eastern districts are admirably adapted to the growth of the white Mulberry tree. I am very glad, therefore, to see that others besides myself are interested in this important question, and I trust that the subject, once fairly ventilated, will not be allowed to rest till practical results have been obtained. I shall be happy to show my cocoons to any one interested in this question.

VARIOUS KINDS OF CAMPHOR.

CAMPHOR is camphor to most persons, few knowing or caring whether it is all the product of one or many different species of trees. The Laboratory tells us that there are various kinds, the ordinary camphor comes from Japan or the island of Formosa, but there are various highly esteemed species of camphor obtained from Borneo and Sumatra. There is also another variety of medium quality produced by the *Blumea balsamifera*, a plant of the composite order, which grows in the east of Asia. The Chinese denote it by the name Ngai, and make use of it in medicine and the manufacture of ink. It produces harder and more brittle nuts than the laurel camphor. Like this latter, it is sublimed at an ordinary temperature, but less easily, while the Borneo camphor does not show any traces of sublimation even after several years. All camphors float in water, but when the air in the interstices is exhausted by an air-pump, Ngai and Borneo camphor sink to the bottom, while the laurel camphor swims. The specific gravity of laurel camphor is .995 that of Ngai 1.02, and that of Borneo 1.011. Laurel camphor melts at 335 deg. Fahr., Ngai at 599 deg., and Borneo at 405 deg. Laurel camphor, washed with hydrochloric acid and still moist, quickly changes to a colorless liquid. In the same circumstances Ngai and Borneo absorb the acid very slowly, and do not turn to a liquid till long after. Nitric acid changes Borneo camphor into an oil, which, on the addition of water, deposits a substance identical with laurel camphor. The same thing occurs with Ngai.

Domestic Economy.

GARLIC BUTTER.

THE Swiss, Germans and French, through habit perhaps, become very fond of the flavor of Garlic, and a large number of the dishes prepared for their tables are flavored with this rank, and to many persons offensive, esculent. There is, however, no doubt of the healthfulness of the Onion family of plants, including the Garlic, and were it not for their strong odor they would be far more extensively used than at present in this country. Butter flavored with Leeks or Wild Onions, which cows sometimes eat in early spring, is not considered improved by the additional odor, but we presume that persons who are fond of Garlic in their soups and other dishes would not object to it; in fact, we find in the Dietetic Reformer a recipe for making "Garlic Butter" out of Sweet Oil, and highly recommending it as nutritious food. But here is what the writer says on the subject:

"I dare say somebody would like to know how to make this delicious relish. Take Garlic, peel it and cut lengthwise into bits, put them in a mortar and rub to a paste, always rubbing 'the same way round.' As you rub keep adding Olive Oil till the 'ajioli' assumes the consistence and appearance of clear yellow honey. Squeeze a Lemon into it, and after a final rub put into a jam-pot. It will keep several days. Spread on bread, or stirred into Bean or Garbanzo porridge, or eaten as a relish with any food, it is delicious and wholesome. In the wine-shops in Spain they put sodium-chloride into it, much as British publicans salt beer. In Spain red pepper is also often added; this makes it nicer to some, but not so palatable to others. Again, Apple is often rubbed up with it to make it bland for some palates. Garlic thus prepared is an especially wholesome dainty for those liable to the common diseases of the respiratory apparatus. If the Garlic be fresh it will take a very great deal of oil. Quite a small handful will be enough for a quart, gradually added. The oil becomes solid in the process, as solid as jelly or honey at a low temperature. How this curious phenomenon results I do not know. This 'ajioli,' or Garlic Butter, is capital spread thinly on bread, and is incomparably wholesomer than cow butter. When quite newly made it will doubtless seem a little full-flavored to some tastes, but becomes milder after it has been kept for twenty-four hours. All whom I have told about it like it very much—children notably. Sound and unadulterated butter costs now close upon 2s. per pound here in Suffolk. Garlic costs 1s. per pound, and Lucca Oil of good quality less than a shilling. Garlic Butter, then, costs about half the price of cow's butter. It is strictly human food, whereas dairy produce is merely a substitute for human food, like meat. Those who have gardens can grow Garlic at no cost at all, as it grows readily and yields abundantly. The oil must be good."

ORIGINAL RECIPES.

Ginger Cookies.—For the benefit of the lady readers of the RURAL, I send my recipe for Ginger Cookies:—Two cups of molasses, one cup of butter or lard, half a cup of sugar, two-thirds of a cup of sour milk, three teaspoons of soda, one tablespoon of ginger.—Mrs. M. P. ALDRICH, *Rathboneville, N. Y.*

Ginger Cake.—One cup sour cream, one of molasses of any kind, one of sugar, one teaspoon of salt, one of soda and two of ginger. Mix stiff and bake quickly.

Jelly Cake.—Break two eggs in a teacup, fill it up with sour cream, one teacup of sugar, a little soda, and do not mix hard. Bake this in three round tins.—FARMER'S WIFE.

INQUIRY.—I have seen many recipes for making lemon pies with eggs. Cannot some expert furnish one for making them without?—F. W.

Broiled Mushrooms.—Wash and drain the mushrooms, then peel them, and place them top down on a gridiron over a slow fire. Sprinkle a little salt and pepper over them while cooking. When done, put a little lump of butter into the hollow of each mushroom. Remove from the fire to a hot dish very carefully to prevent spilling the juice. Send to the table hot.—Mrs. RUSTIC.

Packing Eggs for Winter Use.—Strong lime water is the best of anything, but in the absence of lime many pack their eggs small end down in common salt. Some grease the shells with melted lard and pack in bran. A very good way, too, is to fill a colander full of eggs and pour over them a teakettleful of boiling water, then, when cool, pack in salt. The hot water slightly cooks the outside of the egg, making it air-tight. This is a favorite way with many housekeepers.

To Test Eggs.—As it is desirable in packing eggs for winter use to put up none but good ones, I try mine by rolling up a pamphlet or an almanac just large enough to slip an egg in at one end. Look through this toward the light, and if the egg is fresh it will look perfectly clear; if stale, it looks dark. This is an excellent test—almost unfailing.—FARMER'S WIFE.

Citron Preserves.—Pare the citron, take out the seeds, and cut it into small pieces; weigh it and put it into cold water and boil until tender; throw in a few peach leaves to give it a green color; also a small lump of alum to harden it. Make a syrup of three-quarters of a pound of sugar for each pound of citron, and for every seven pounds use four lemons and two ounces of green ginger-root. Slice the lemons and ginger-root thin, scald them in a little clear water, after which add the sugar. Boil the syrup down until thick, then add the citron and let it boil five minutes. Take the whole up in jars and seal up close, and keep in a dark, dry, cool place.

Hygienic Information.

A WORD TO PARENTS.

PARENTS little dream how much of the trouble caused by misconduct of children is attributable to their own neglect of duty, in leaving them so entirely to the influence of hired nurses, most of whom are ignorant, and many even vicious. The influence of the nurse over the mind of the child under her charge often exceeds that of the mother herself, and while the young mother smiles approvingly when her darling leaps eagerly from her own arms into those of the nurse, and flatters herself that she has found, in that nurse, a jewel—she does not stop to question what may be the consequence of this preference for an ignorant untaught servant; what ideas may be instilled in the innocent mind, and what lessons of deceit and immorality may be engraven upon the pure young heart. "My baby scarcely knows that she has a mother; she will cry to leave me for her nurse, at any time," I once overheard a fashionable young mother say to several of her friends, and child as I was, I could but pity the dupe of that nurse's cunning for I had been much with her, and heard her use language and relate stories which were absolutely disgusting to me, who had received my early tuition entirely from a devoted mother. Years after this, the beautiful child grew to womanhood, beautiful still—and accomplished, but an avowed unbeliever, an atheist; and was it strange that the seeds of infidelity, sown by the faithful nurse, so prized by her mother, should germinate, and as the bright mind expanded, take deep and firm root. I have seen the mother, then no longer a giddy votary of pleasure, but a sincere and trusting Christian, weep bitterly over the unbelief of her darling, little dreaming that while she had glided through the brilliant ball-room—or sat at opera and lecture, her child was learning her first lessons in skepticism.

But not only are the thoughtless and pleasure-loving guilty of this great and sinful neglect of the precious charge given them; how often do we hear it remarked that ministers' sons are always wicked, and how often does the remark prove true, though none dare doubt the sincere piety of the father. The truth is, parents take upon themselves too many unnecessary burdens and consider themselves, bound by duty, to perform too many tasks, which are of much less consequence than the teaching and training of their children.

The father has his trade or profession, and his few leisure hours he must spend in social pleasure. The mother has her household cares and the comforts of her family to study, and besides this, there is much time to be devoted to fancy work, to visitors and to amusements of one kind and another. She will perhaps spend days upon some useless piece of embroidery or patchwork, while her children are left to the mercy of kindness. Their dresses may be miracles of pulling, ruffles, and embroidery, but what does that count when their minds are dwarfed through neglect; her house may be a model of neatness, her bread excel that of all her neighbors, her jellies and preserves enough to tempt the most fastidious; but, if in all this, she has kept aloof from her child, has chilled his heart towards her, what does it count? Would it not be a better plan to hire her house cleaned, procure bread of a baker, and buy of a confectioner her preserves and jellies and devote more time and attention to the instruction of the child God has given her and for whose acts hereafter he will hold her more or less accountable? What will avail her model of a house when the heart of her child is full of evil passions, or when his hands are dyed with the blood of a murdered fellow-man? Her own heart may one day feel a hunger, or yearning for that child's love, for his welfare, and she may even die of this hunger while her pantries and her storehouses are full of the good things she has provided.

M. JAYNE.

BARLEY WATER PREFERABLE TO MILK.

A PAPER entitled "Observations on the Digestibility of Milk," read a short time since in London by Dr. Carter, has attracted considerable attention. In this paper, Dr. Carter, as reported, discussed various methods which had been generally used with a view of promoting the digestibility of milk, pointing out that their efficiency was essentially due to the dilution of the caseine, thus causing the precipitation, on its introduction into the stomach, in a granular form, of what would otherwise be firm, bulky, and compact. He further showed, by experiment, that simple dilution with water is insufficient for this purpose, and that the object is far better attained by adding mixture of alkaline or starchy waters with the milk. Dr. Carter summed up by giving a decided practical preference to barley water, and this conclusion he illustrated and supported by various experiments.

ACTION OF COD-LIVER OIL IN DISEASE.

BUCHHEIM finds that cod-liver oil has an acid reaction, and contains, in addition to the fatty glycerides, free fatty acids—oleic, stearic, and palmitic—the quantities of which vary in different kinds of oil, but amount in the clear variety to about five per cent.; and no biliary matters are present in the oil. Its value, according to Buchheim, depends on the presence of the free fatty acids, since the absorption of fats is preceded, to a certain extent at least, by their disintegration into glycerine and fatty acids; and as the latter are introduced in cod-liver oil in their free condition, and thus easily unite with the alkalies of the intestinal juices to form soluble and easily absorbed soaps and combinations, a part of the digestive work is spared, which is of importance for weak persons with deficient power of producing the gastric juices.

HOW TO GROW FAT.

1. TAKE soup and beer every day, also hot milk-coffee or chocolate well sweetened. 2. Let your food be chiefly farinaceous and vegetable; bread with butter or milk; milk-mush, potatoes, cabbage, turnips etc., prepared with butter, sweet puddings. 3. Eat meat only once a day; the fatter kinds are the most suitable. 4. Take neither acids nor alkalies, and avoid everything that disagrees. Milk, butter and sugar are very fattening, but everybody cannot take them with impunity, and to grow fat it is essential that digestion be almost perfect. 5. Sleep all you want, and take exercise in moderation.

HYGIENIC NOTES.

The London Milk Journal says that a pint of milk heated a little, but not boiled, taken every four hours, will check the most violent diarrhœa, stomach ache, incipient cholera and dysentery.

Sure Cure for Inflamed Eyes.—Take half an ounce of Golden Seal (you will find it at the drug stores), pour one-half pint boiling water upon it and let it cool. Bathe the eyes with a linen rag dipped in this, each night on going to bed, and you will soon effect a cure.

Simple Cure for Rheumatism.—Boil a small potful of potatoes and bathe the part affected with the water in which the potatoes were boiled, as hot as can be applied, immediately before going to bed. The pains will be removed, or at least alleviated, by the next morning. Some of the most obstinate rheumatic pains have lately been cured by one application of this novel and simple remedy.

Around the Republic.

A VISIT FROM GRASSHOPPERS.

THE New York Times publishes the following private letter written by a gentleman residing in Kansas to his father in this city. It is quite characteristic, and reminds us of devastated fields we have seen in Kansas, Nebraska and other Western localities some years since:

SALINE COUNTY, KAN., Sept. 8, 1876.

MY DEAR FATHER: No man can successfully fight against nature. The contest is unequal—nature caring no more for a man than for a grasshopper. Ah! the "hopper." To-day I lost sixty acres of wheat, eaten into the ground in less than an hour. I thought I had seen locusts two years ago, but I was mistaken.

At about 10 o'clock this morning I noticed a heavy smoke rising in the west. I said to myself, "that is strange-looking smoke. What causes it?" I sat on my wheat drill and watched it. Rapidly it arose—smoke rising to the south, to the north, to the north-east. In a few minutes the column of smoke extended from the south around by the west to the northeast—to the extreme limit of vision. While I was saying to myself, "Yes, I understand you now," my heart slowly sank. Unhitching my team, I put my full wheat sacks in the wagon, hitched to it, drove to the granary, unloaded, drove to the house, got my gun, and went prairie-chicken shooting. My wife looked at me in mild surprise. Quitting work on a beautiful day to go shooting was a queer thing, she thought. I did not have the heart to tell her that in less than four hours her nice garden would be cleaned out and that all our wheat would be gone. Soon the low hum, as of a distant threshing machine, filled the air—the advance of the locusts. Louder, louder, ever louder the hum, till in a roar the countless billions of devourers were on us, all around us. The air was stiff with them. I could look at the sun without blinking. They settled constantly. The earth was covered with them, yet not one in a thousand stopped. To the east they went in a vast cloud. A west wind, a gale, blew them.

For six hours they flew, a solid cloud; and to-night there is not a wheat plant left in any of the counties about here. I sat on a hill and watched them, and smiled as I saw some hundreds tackle a sun-flower, and laughed as I saw that sun-flower vanish. How thick they were! How harmless they looked; but, great Jove, how they ate! Ah! what appetites they have. It would make a dyspeptic turn green with envy to see the way they fasten to anything and everything edible. The characteristic of a grasshopper's appetite is, that all he eats runs to appetite. Sixty acres of my wheat was up. Now it is down—the gullets of the locusts. I suppose they will take the residue as it comes through the ground.

Well, I shall have to reseed, that is all. But the loss of seed and labor is pretty sore on me this year. I have joy in saying that I have eighty acres of corn that will try their teeth somewhat. It is as hard as corn can be. I walked down this afternoon to see how they were making out with it. They had the stalks all stripped of leaves, and were sawing at the corn. But I could see that it was no go. Their teeth slipped over the bright-yellow surface. I have gone to haying again, and will hay until the locusts leave. I still keep three plows running, and will reseed as soon as possible. Our garden is perfectly cleared; beans, cabbages, tomatoes, melons, everything utterly gone. The vines to the potatoes are gone, and I am expecting a boss hopper up here at any minute to request the loan of a spade to dig up my potatoes with. I shall refuse his request with scorn.

"PROGRESS AND IMPROVEMENT."

THE RURAL NEW-YORKER,

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

ANDREW S. FULLER, Editor.

ELBERT S. CARMAN, - - Associate Editor.

X. A. WILLARD, A. M., Little Falls, N. Y.,
EDITOR OF THE DEPARTMENT OF DAIRY HUSBANDRY.

G. A. C. BARNETT, Publisher.

TERMS FOR 1877, IN ADVANCE,
INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.50 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $11.25; Seven Copies, and one free, for $16.05; Ten Copies, and one free, $20—only $2 per copy. The above rates *include postage* (under the new law) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 25 cents extra for each subscription. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

ADVERTISING RATES:

Inside, 14th and 15th pages (Agate space)..	40c.	per line
" 13th page.....	50	"
Outside or last page.....	60	"
Fifty per ct. extra for unusual display.		
Special Notices, leaded, by count.....	70	"
Business "	80	"
Reading "	1.00	"

Discount on 4 insertions, 5 per ct.; 8 ins., 10 per ct.; 13 ins., 15 per ct.; 26 ins., 20 per ct.; 52 ins., 25 per ct.
☞ No advertisement inserted for less than $2.

SATURDAY, OCT. 7, 1876.

PRICES ARE FALLING!

THE PRICE OF

THE RURAL REDUCED TO $2.50

TO SUIT THE TIMES.

Club Prices Reduced Proportionately.

Mindful of the great encouragement which has been extended to us in our efforts to improve THE RURAL, *we have concluded to show our appreciation of the same by reducing the price of* THE RURAL *to* $2.50 *per year,*

POSTAGE INCLUDED.

By doing this we ourselves pay the postage, which has heretofore been paid by the subscriber. In addition to this, we inaugurate a graduated scale of prices for small clubs, so that all who send names with their own, up to ten, can get a reduction for each name so sent. And for a club of ten or more, a beautiful premium in addition. Now that THE RURAL *has come down, let each subscriber send with his or her own name that of at least two neighbors. Those who wish to become new subscribers or agents can receive Specimen Copy and Premium List free. Address*

"WE HUMBLY BEG."

IN a petition to State and National Legislatures, it has long been the custom to insert the phrase, "We, your petitioners, *humbly beg*," as though the sovereign people were beggars. This phrase, as well as many others in use, came across the Atlantic, a relic of monarchical governments, where the "divine rights of kings" are acknowledged by the common people; but it has no place in a republic and should be tabooed from our literature. In a copy of a petition now being circulated for signatures in Minnesota, to be forwarded at some future time to Congress, asking that "Honorable" body to appoint a commission whose business it shall be to inquire into the Grasshopper plague in the North-western States, contains this to us detestable phrase, "we humbly beg."

Going down on one's knees before royalty and kissing the hem of some idiot's garment who, through perhaps hereditary descent or wealth, happens to hold a high position in society, should be no more revolting to the free-born American citizen than this "humbly begging" for one's rights. We believe in the most exacting politeness between man and man, master and servant, mistress and maid, and the superior should ever be careful that he is not outdone in this by the inferior, if such there be in his service or company; but this does not call for crawling on one's belly in the dust nor bending the knee to fellow man; for we, as Americans, profess to believe that man was made in the image of GOD and to walk upright before Him and His creatures. We elect men (or those supposed to be) to our State and National Legislatures, to make necessary and useful laws to further our interests and progress as a people; not to abuse their position or our confidence, and they are only our agents and servants, consequently, why should we go begging of them to do the will of their constituents? To do this is neither manly nor becoming of a people who profess self-government. Is it not just the right time in this, our Centenary year, to expunge these hateful words, "humbly beg," or "pray," from all petitions to legislators, and insert in place of these "we ask," or "demand" of you certain acts or things?

If the annual destruction of a hundred millions of dollars' worth of property by grasshoppers in the North-west upon land sold to the settlers of those regions by the Government, or held through its connivance with railroad companies, is not a sufficient excuse for asking Congress to appoint a commission to investigate the subject and see if further destruction cannot be averted, then we say to the settlers there—suffer on "humbly" until your misery makes you strong enough to *demand* investigation and protection.

Doubtless our Honorable Congressmen would much prefer to wage war against the Sioux and gain a little more of the Grasshopper territory, than to protect and take care of what we already have; but those who see their crops destroyed and the bread taken from their children's mouths by these pests, may think differently, and they certainly have good reasons for the opinions held.

We had a grand "blow up" here in New York a few days since, and it cost the people of this country two millions of dollars; and there are to be other "blow-ups" in the same pond, which will cost three or four millions more; and we are all proud of this grand triumph of science and engineering skill, backed by money; but we have existed and prospered a century without those improvements and should have gone on prospering without them, for no one was compelled to run against the rocks of Hell Gate, neither was there the least danger of millions of dollars' worth of property being destroyed if these rocks had been left another century intact; but they were in the way of certain crafts which navigated the East River and Long Island Sound, and there was not lacking *influence* or interest enough in the enterprise to get the necessary appropriations to do what has been done, and is still to be done in the future.

Now our Western farmers and residents in the Grasshopper-infested regions, must send men to the National Legislature pledged to do their will in this matter. Make their political platform of only one "plank," and let that be the doing of their constituents' will; and if they step off or shirk their duty, tip up the plank and shove them overboard, and see to it that the one sin, "neglect of duty," carries the carcass beyond the reach of a political resurrection.

BE IN EARNEST.

THERE is something about a person who does everything as though he was thoroughly in earnest that commands attention and respect. Success never comes from any half earnest attempt, because there is too much competition in this world to permit of much "laggardism," either in business, social intercourse or friendship. Probably one of the most repugnant tasks which a man may sometimes be obliged to perform, is that of borrowing money; but the one who seeks a capitalist in an earnest, confident manner, showing by his actions that he is sanguine of meeting obligations when due, is far more likely to get the accommodation than the one who walks and talks timidly in such business operations.

Earnestness and confidence in one's own abilities and skill to perform certain acts, form a kind of personal capital which goes a long way in this world towards making a man's life a success. It does not matter what a man is doing, if he puts no enthusiasm or earnestness into his work, it will drag and the wheels will move slowly and creak with friction. Now, as we hold that this earnestness of character is but a habit which may be cultivated or suppressed, either in individuals, families or nations; becoming hereditary under certain conditions and extinct under others, it is therefore, in this view, not a matter of theory or speculation but something which should command our earnest attention.

Parents in particular should carefully avoid suppressing a show of earnestness in their children, for there is little danger from an exhibition of too much, though there may be a need of proper direction. The child who has been encouraged to do everything in an earnest manner, will generally retain the habit through life, and the only thing to be considered is the proper direction of this earnestness, for it must be admitted that the same faculties may be turned either to do good or evil, and the more they are cultivated and strengthened the more pronounced the results. Still, we must adhere to our first proposition of being in earnest in the performance of every act, whether it be as children playing ball, going a fishing, or engaging in any other similar amusement. Then in later years, the habit having become fixed, we will find men and women entering upon the sterner duties of life all in earnest, and obstacles which might appear formidable to persons lacking this habit, will be brushed aside without a moment's hesitation or notice.

We like to see men follow a plow as though they enjoyed seeing the fresh soil turned over and their faces lighted up with a peculiar expression which says, "I am thinking of the crops which will be reaped here next fall, or next year." Such men will walk briskly to their labors and home lightly when they are finished, and many an acquaintance will marvel at the elasticity of the step when age is supposed to stiffen joints and enfeeble the frame, not having learned the great lubricating and strengthening powers of earnestness of character and habit.

RURAL NOTES.

Doryphora 10-lineata and Tobacco.—It is often stated that the distinguished Potato Beetle, though preferring the Potato plant, will, in its absence, feed upon any other member of the Night-shade family. The Tobacco plant is forgotten. We believe they have no fondness for "the weed" in any form. It is well for the Potato Beetle that it is so. We have many substitutes for the Potato upon a pinch, but not one that can take the place of "the weed." Were the Potato Beetles to desert *Solanum tuberosum* in favor of *Nicotiana*, an avalanche of popular lightning would fall upon their unfortunate heads that would squelch them out in a year. The taste for tobacco is wholly artificial. If the Potato Beetle has a whit of man's refinement of taste, and that it has is shown from the fact that both are fond of Potatoes, it is susceptible of an appetite for tobacco. Our benevolent entomologists who are anxious to be of service in practice as well as in teaching, have only to create and cultivate this taste in Doryphora and a positive exterminating measure—a little round-about, perhaps—will be the result.

American Beef Abroad.—Our English cousins are becoming quite enthusiastic over the prospects of being supplied with fresh American beef. One writer bursts forth in this wise when speaking of the beef in English markets which was slaughtered fourteen days previously. "This marvelous triumph of art over nature bursts upon the consumer by surprise." Of course, producers on this side of the Atlantic are only too happy in furnishing their cousins on the other side with beef fresh salted, for there is little danger of the supply giving out during the next century at least.

Reduction in Advertising Rates.—In announcing the reduction of our advertising rates this week, we merely wish to call attention to the point that, in common with all others who recognize the fact of Hard Times and Reduced Prices, we are looking for increased business. While our circulation is steadily increasing we are reducing both the price of the paper and the rates of advertising and expect to continue to do so in order that our patrons may have a good share of the benefits of our success. They are entitled to it and we intend that they shall have it. See card of rates.

RURAL BREVITIES.

BOOMER & BOSCHERT Cider Mill receipts for Thursday (Pennsylvania Day) were $685—cider 5c. per glass. Some one must have had early practical experience in passing fluid through a straw.

FROM the report of the late meeting of the Hop Growers' Union of Central New York, we learn that there has been a large increase in acreage during the past year, but a falling off in the yield in nearly all plantations owing to an unfavorable season.

THE Pomological exhibit at the Centennial is entirely satisfactory to our people, it being the largest display ever made at any show in this country—which is saying a good deal; for there have been some grand fruit shows at some of our State Fairs in times past.

THE happy people at this time are those who have been awarded prizes at the great Centennial show. We wonder how many of the grand or great-grandchildren of these men will make an exhibit at our Bi-Centenary exhibition in 1976?—supposing, of course, that one is held.

CATTLE and hog buyers, being good judges of the live weight of animals, are constantly buying without weighing and frequently make large sums by farmers under-estimating the weight of their stock. Weigh all your animals when you sell, and before you sell ascertain the true value at the time of sale.

THE Gold Medal made by special order of the National Butter and Egg Association, will be awarded to the best butter exhibited, as decided by the Centennial Committee, for the "best package of butter of not less than *fifty* pounds, net weight, that may be exhibited on the 17th of October." Who will be the lucky winner of this prize?

THE announcement made by LORD & TAYLOR on another page, should command the careful attention of our lady readers. The system of shopping by mail, until adopted and incorporated as a regular department of our leading house, had its disadvantages. These have been counteracted and converted into benefits. It is now possible, for ladies living in the country to shop in New York without the expense of a personal visit, thus availing themselves of the undoubted bargains that are daily offering in this mart. Purchasers can have samples sent them from which to make a choice, and they will as absolutely receive what they order as regards price, quality and fabric, as if they personally supervised the transaction. A trial will convert a novice into a confirmed supporter of the system.

J. STEVENS & Co., Chicopee Falls, Mass., perfected their breech-loading sporting rifle, until now it must certainly be what they state it has become—the Hunter's Pet. An examination convinces the writer that the arm is handy, nicely poised, and the workmanship performed in a thorough manner. The sights are of the most approved designs, and the range and accuracy are as perfect as can be desired in an arm of this kind. This firm have but recently put upon the market a new breech-loading double gun at a popular price—$40 and $45—that has an entirely novel application of the breech-lock, the barrels being thrown up to receive the cartridge by merely pressing a third trigger that is just forward of the lock triggers. The reputation of the house precludes the necessity of saying anything about finish, etc. Either of these guns may be seen at H. 71, Main Building Centennial Exhibition.

BUSINESS NOTICES.

The Highest Grand Award of the Centennial Commission was given to Wisner's "Tiger" Sulky Horse Hay Rake. WISNER is still ahead, and the Tiger growls victoriously—he will be heard from the coming season from Maine to California.

THE ROSE TREE.

BY VIOLET FULLER.

WITHIN a happy, sheltered home,
A little rose tree bloomed;
Its leaves unfolding one by one,
The air around perfumed.

It to the sunshine raised its head,
And grew from hour to hour;
The parents smiled, it seemed so fair—
Their modest little flower.

But when the blasts of winter came,
The little rose tree sighed,
And shivered, as it heard the storm,
That roared so fierce and wide.

"Earth is too cold for me," it said;
"Its storms will surely come,
And beat on my defenceless head,
E'en in this sheltered home."

The Master looked from Heaven above;
"Sweet rose," he whispered low,
"Earth's storms are cruel, and its stains
Will soil thy leaves of snow."

Then quickly to his garden fair
He took the pretty flower,
Where no dark, earthly stains do come,
Or stormy skies do lower.

"O give us back our snow-white rose,"
The weeping parents cried,
"For home is dark, we cannot live
Since our fair rose tree died."

"Peace peace, beloved," the Master said.
"Your rose is safe with me:
Within my Paradise it lies
And blooms eternally.

"Far, above all earthly storms,
Above all earthly care,
Look up, and with the eye of faith,
Behold your rose tree there!"

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 221.]

TEXAS.

IN 1819, when Florida was purchased from Spain, the South-west boundary of the United States was determined to be the Sabine, the Red River, &c., thus, as it was supposed, ending the controversy as to rights in Texas by conceding it to be a part of Spanish possessions in America. This Texas comprised but a small portion of the country now known by that name, including only that lying between the Sabine and the Nueces, with its northerly limits above Austin and Bexar.

In 1822 Mexico, including Texas, threw off Spanish dominion and became an empire under ITURBIDE, with the title of AUGUSTIN I. as Emperor. After reigning ten months, he was compelled to abdicate by a revolution headed by SANTA ANNA, who succeeded in effecting a confederation of the nineteen States and four Territories of Mexico, with a republican form of government. Almost continual war existed between the political parties from that time until 1835, at which time the Confederated States were made a consolidated Republic and the States reduced to the condition of Provinces.

In 1824 Texas had been consolidated with Coahuilla and given a State Government, conditioned that Texas, which was then but sparsely inhabited, might have an independent Government so soon as it should be "in a condition to figure as a State for itself." Meantime, immigrants had been attracted to Texas from Southern United States and some from Europe, and in 1833 a memorial was sent to the Mexican Congress, asking to be separated from Coahuilla, claiming the right from the fact that as a distinct Province, they shared the privations, toils, expenses and dangers of the war with Spain; that there was no bond of union or community of interests between the two Provinces; that such laws as benefit Coahuilla were mostly injurious to Texas, and that she was virtually without a Government; that the union had been made to be continued only until Texas could figure for herself, &c., &c. The memorial was sent to the Mexican Congress only to be rejected, and the messenger was detained as a prisoner until the summer of 1835.

The United States offered to purchase Texas from Mexico, but the offer was declined. All this time the real reason for the discontent of the Texans had not been given. How often is it the case that the real cause of action in nations as in men, is kept hidden, while others less influential are made known! The Mexican laws did not allow slavery. The soil and climate of Texas were supposed to be, in a superlative degree, favorable to the institution. A large proportion of the then residents of Texas were from slave States and with pro-slavery inclinations. The plan was, from the first, not only of the Texans, but of influential parties in the States, to first free Texas from Mexico and then annex—or reannex, as they preferred to say—the new Republic to the United States. With this end in view SAM HOUSTON became a resident of Texas in 1832.

In 1836 Texas refused to submit to SANTA ANNA, whom they styled a dictator and a tyrant, and proposed annexation to the United States, by whom it was declined on the ground that Mexico, with whom it was at peace, would have just grounds of complaint. A Declaration of Independence was then issued, a Constitution framed and HOUSTON made commander-in-chief of the army. Before this time Mexican troops sent to put down insurrection had been met and many contests ensued, but from this time the war was to the knife.

In April, 1836, at the battle of San Jacinto, SANTA ANNA was taken prisoner. An agreement was soon entered into between him and the Texan Government to the effect that hostilities should cease, that the Mexican army should cross the Rio Grande, that all prisoners should be released, and that he would use his influence with the Mexican Government for the recognition of Texan independence, in consideration of which he was to be released and conveyed to Vera Cruz. After he had been placed on board ship and was ready to sail, at the demand of the army he was again landed and detained as a prisoner against his protest until November, in the same year, when HOUSTON, having been elected President, he was released. He immediately went to Washington to arrange, he said, for the proper understanding between the United States and Mexico. He remained in Washington nine days and was sent home in a United States ship-of-war. He did not keep his promise to Texas, and although for a long time hostilities were suspended, Mexico refused to treat with the new Republic whose independence had been acknowledged in 1837 by the United States and in 1840 by England, France and Belgium. Marauding expeditions entered Texas in 1841–42, but made no attempt to subjugate the country. Texas attempted to repay this conduct in kind and made unsuccessful attempts on Santa Fe and other Mexican towns.

In 1843, by intercession of Great Britain, SANTA ANNA agreed to treat, and commissioners were appointed on both sides. Before their meeting, Texas had received overtures from the United States looking to annexation. This displeased Mexico and caused her to dissolve the commission. It also displeased France and England, whose desire it was that Texas should remain independent under their joint protection without slavery, and under no obligation to and subject to no influence from the United States. The terms of annexation were agreed to by Texas, approved by our House of Representatives, but rejected by the Senate April 12, 1844, receiving only 15 votes. But the end was not yet, and it was far from certain that the friends of slavery in the United States were displeased at the result.

An important Presidential election was pending; and some lever was wanted to defeat the nomination by their party of Mr. VAN BUREN, a Northern man who, although with Southern principles, was not satisfactory. So Mr. POLK was nominated by one party, while the other supported HENRY CLAY, who was well known to be averse to annexation; and the question was one of the most prominent in the election of 1844. Mr. POLK was elected, but the question was not left for his action. In the session of Congress following his election, the question was again discussed and a bill, so written as to give the President power to negotiate with Mexico for the purpose of gaining her consent to annexation and fix boundaries, or to annex without her assent, passed the House of Representatives, February 25, 1845, and the Senate March 1. So soon as the Senate had voted, the bill was sent to President TYLER for his approval, which was given without hesitation, and without any reference to the wishes of Mexico, two days before the expiration of his term of office. By convention held in Texas in July, annexation was accepted and a constitution prepared, which, being acceptable to Congress, Texas became a State of the Union, December 27, 1845. But where were the bounds of Texas? When the Louisiana purchase was made, United States claimed to have acquired title as far west as the Rio Grande del Norte. The Mexicans frequently exercised jurisdiction east of that river, but it was only by sufferance. Mr. JEFFERSON, whose attention was called to it during his administration, said, "Let whoever will occupy our territory west of the Sabine, we neither want it now, nor will it pay to assert our rights at present; but it is ours, and when we want it we will extend our jurisdiction over it, and all people must submit."

When the treaty with Spain was made in 1819, our South-West Line was definitely fixed at the Sabine and Red River. The Province of Texas never extended west of the Nueces and but little north of Austin. The Republic of Texas had established itself no further west than the Nueces and the Pecos, to the line of New Mexico and thence east along said line to the United States boundary. When annexation took place the boundaries were not defined in the resolutions of Congress but left subject to adjustment by this Government and all other Governments in any way interested. But no sooner had annexation been agreed upon upon than Texas laid claim to all territory east of the Rio Grande and south of 42°.

In July 4, Gen. TAYLOR, who was in command of the United States forces in Texas, was ordered to take such positions as would enable him to defend the territory acquired "to the extent that it had been occupied by the people of Texas." He stopped at Corpus Christi on the west bank of the Nueces near its mouth, and here remained until February, 1846; when, receiving orders from President POLK to advance, he pushed across the desert separating the Nueces and the Rio Grande and erected a fort commanding Matamoras. The Mexicans requested him to retire—pending negotiations between the two countries relative to the boundary—which request was accompanied with information that his refusal to do so would be considered by Mexico as a declaration of war. TAYLOR could only obey orders and remain.

Early in May the Mexicans crossed the river, on the 8th attacked the United States army at Palo Alto and were badly defeated. They retreated to Resaca de la Palma, from which position they were driven the next day (the 9th) and compelled to recross the river.

On May 11th, in a special message to Congress, President POLK asserted that the Mexicans had "at last invaded *our* territory and shed the blood of our fellow citizens on *our own* soil." Congress two days after declared that "by act of the Republic of Mexico, a state of war exists between that Government and the United States," and measures were taken for its prosecution.

This war with Mexico continued until February, 1848, when a treaty prepared by Commissioners appointed by the Mexican Congress on the one side and NICHOLAS P. TRIST—who had been sent to Mexico from Washington the year previous, with extraordinary powers—on the other, was negotiated and signed at Guadeloupe Hidalgo.

By this treaty the boundary between Mexico and the United States was fixed and determined to be the Rio Grande from its mouth to El Paso, and in consideration of the expenses of the war, $15,000,000 in hand paid and the assumption by the United States of debts due by Mexico to American citizens to an amount not exceeding $3,700,000, Mexico ceded to the United States all of New Mexico and California, of which, during the war, the United States had already taken possession, Gen. KEARNEY having established himself at Santa Fe and Gen. FREMONT and Commodore STOCKTON having practically conquered California.

A dispute afterward arose relative to the southern boundary of New Mexico which, on account of inaccuracy of the map used when the treaty was written, did not seem to be well established. Both parties were anxious to possess the Mesilla Valley, which was not only supposed to be a very fertile section, but through which was the most feasible route for a road. SANTA ANNA, then again at the head of the Mexican Government, took possession of the territory in controversy and refused to leave without compensation. The United States finally agreed to pay $10,000,000 for the undisturbed possession of the Valley, the free navigation of the Colorado River and of the Gulf of California. This bargain—known as the GADSDEN Purchase—left the line between Mexico and the United States as it now remains.

IOWA.

THE first settlement within the present limits of the State of Iowa, was made in 1788 by JULIEN DUBUQUE, a French Canadian, at the present city of Dubuque. Having obtained a grant of a large tract of land in that vicinity, some of which was rich in minerals, he built a small fort and commenced mining for lead and trading with the Indians.

The country was at first a part of Missouri Territory, but afterward came under the jurisdiction of Michigan Territory, being a part of what was known as Huron District. In 1836 this District was made into a Territory and named Wisconsin. From this time immigration constantly progressed, settlements extended west, and crossing the Mississippi immigrants established themselves upon the Des Moines, Skunk, Lower Iowa and Waubesapinacon rivers. These settlements soon became of considerable importance and were, for temporary judicial purposes, erected into the District of Iowa, of Wisconsin Territory. But with increase of population this union became unsatisfactory and in 1838 the District was given a Territorial Government and made to comprise all that region of country north of Missouri which lies west of the Mississippi River and of a line drawn due north from the source of the Mississippi to the northern limit of the United States.

In 1844 the people of this Territory made application for admission as a State, and an act of Congress was passed consenting thereto so far as related to the area embraced by the northern boundary of Missouri, the Mississippi River, the parallel 43° 30′ north latitude, and the Big Sioux and Missouri Rivers. To this restriction of bounds Iowa was unwilling to agree and determined, rather than submit to such abridgement, to remain a Territory; but in 1846 the matter was further considered, the provisions of the act of Congress complied with and Iowa became invested with State Government.

WISCONSIN.

The country now embraced within the boundaries of Wisconsin has been successively under the jurisdiction of the territory northwest of the Ohio and of the different Territorial Governments of Ohio, Indiana, Illinois and Michigan. The Huron District of Michigan Territory, in which Wisconsin was included, comprehended all the area from Lake Michigan to the Mississippi River, including all the sources of the Upper Mississippi having for its southern limit the northern lines of Illinois and Missouri, and extending north to the national boundary. This domain, named Michigan, was given a Territorial Government in 1836. In 1838 it was divided by the separation therefrom of Iowa Territory. In 1848 the country between the Rivers St. Croix and the Mississippi, was set apart and named Minnesota, and to the remaining portion of Wisconsin a State Government was given by act of Congress passed May 29, 1848.—[To be continued.

The Story-Teller.

TERESA.

AN ITALIAN STORY.

I.

LIGHT, heat, beauty, life-giving South! The artist seeks it for its glorious depths of color; the poet for its classic traditions and dreamy influences; the invalid for its balmy breath and reviving warmth, which stir the pulses that in northern lands would cease to beat. Lionel Merton, half poet, half artist and half invalid, sought it for life both of mind and body; and his delicate frame—shattered by the chill blasts of the north—woke to a new being in the soft Ausonian climate, whilst his artist eye glanced with a pleased delight over luxuriant plains and olive-planted slopes, with here and there a glimpse of the yellow Tiber flowing majestically along.

He was just now standing in the doorway of the inn, gazing not at the landscape or the skies, but at a face that had attracted his attention more than once since his arrival at——. He had seen it first in the beautiful gardens of the villa, not far from the inn, peering through the parted branches of a myrtle, whose dark, glossy leaves seemed to form a fitting framework for the living picture behind them. But the branches had closed hastily as the girl met the blue eyes of Lionel fixed steadfastly upon her.

"We must go home, Tina," said she to the child, who was watching the doves wash themselves in the basin of the fountain, and she swung it up to her shoulder, where it wound its tiny hands in her dark hair, loosening some of the coils that fell heavily down below her waist. A flush came over the pale olive skin.

"Thou art a bad child, Tina!" she said, as she hastily twisted up the long tresses under the folds of her white head-gear.

The large lustrous eyes had but looked at Lionel for a moment, and yet they seem to have told him a long story that he had been in the past trying to decipher.

Next he had seen her in the church, kneeling in fervent prayer, and had silently watched the changes of countenance until she again perceived him, and with a startled look rose and fled away.

To-day Teresa stood leaning against a stone pillar, playing with the pink blossom of a catalpa that stood near her, when suddenly she found herself once more face to face with the English stranger.

He had discovered her name—Teresa; daughter of blind Tomaso Cecchi and his bed-ridden wife. She was a good daughter and worked hard to support her parents. To-day she seemed to be taking life easily—drinking in the splendor of the purple mists and golden sheets of sunlight with true Italian indolence.

"*Dolce far niente!*" thought Lionel, as he looked at the statue-like figure and the head thrown back, partly with weariness, partly with an intense appreciation of the beauty around her.

But Teresa's rest was not to be of long duration. The *Mercanti* of the Campagna had sent for laborers to gather in the harvest, and men and women were forming into bands to join in the work. Teresa was going, so gossip had told Lionel, and to him it seemed a sacrilege that the beautiful maiden should toil and slave with the common multitude. But what could he do? And in the midst of his meditations the girl raised her face and again their eyes met.

"Teresa!" The name burst involuntarily from his lips.

She started and blushed, but this time did not flee away. She looked up at Lionel.

"Si; signore," she answered.

"That is a pretty flower," said Lionel; "will you give it to me?"

She made no reply, but put the blossom into his hand. And so the acquaintance was made and the two chatted away in the sunshine.

II.

Lionel had gone to Tomaso Cecchi's lodging.

"But your daughter is not strong enough for such work!" said he, in conclusion to a long harangue.

The old man shrugged his shoulders. "Poverty," said he, "is a hard master, and Teresa is a good girl."

"Too good to endanger her life in the toils of the Campagna. Think of the risk, the labor, the heat, the foul evening mists!"

But Tomaso looked back beyond the discomforts and remembered a time when the plains resounded with songs and laughter and the wine was broached and hearts were light.

"I found my wife there," said he, "and Teresa may find a husband."

Lionel instinctively drew back. A husband among those laboring peasants! Impossible; for in his eyes Teresa was worthy to be the bride of a king.

Can you not find a substitute for your daughter? I——," and then he hesitated, for Teresa had come into the room.

"How much will it cost to get a substitute, Teresa?"

Teresa laughed. "Giovanetta would pay if she could to go in my place," said she. "There are too many ready and willing to go."

"Let them go, then!" responded Lionel, eagerly.

"The signore forgets we must have money," returned Teresa.

Scarcely thinking of what he was doing, Lionel had poured out the contents of a purse full of English gold upon the table. The quick ear of

Tomaso caught the sound; he stretched out his hand as if to clutch the ringing coin, but Teresa sprang between, turning a flashing face upon Lionel.

"We are not beggars!" she exclaimed; "I work for my bread!"

"Will you not let me help you?" asked Lionel, in a low tone.

"You cannot," she replied, in an equally low voice; and the flash died out of her face, for Lionel's tone was very humble and his eyes had spoken something to her that her heart answered. She gathered the money together and put it into his hands.

"It must not be," said she, as he sorrowfully departed.

"Thou art a fool, child!" said Tomaso Cecchi, when Lionel was out of hearing. "These English know not what to do with their gold, and we should have been all the better for it."

III.

Slowly plodded the large, gray oxen over the plains of the Campagna; lazily sauntered the drivers at their side. Here and there one heard the sounds of merriment; there again were silent toilers; here worn-out laborers who had crept into the shade and fallen asleep, and above stretched the blue heavens, still and cloudless, over the gray and purple sweeps of far-off landscape, with here and there a patch of sun-gilt water.

All this Lionel saw, for he had obtained a lodging in one of the large stone farm houses, since money will obtain anything; and the fair, delicate-looking, generous Englishman was popular among the poor Italian peasants.

Teresa knew that he was there, but she avoided him; and he, seeing this, only watched her from a distance, and gave no token that she was more to him than any other laborer on the vast plains. He had seen Tomaso and his wife before he had followed to the Campagna, and they were amply provided for during their daughter's absence.

Lionel Merton had fallen in love, and he sat down and took the matter into deliberate consideration. His first thought was that Teresa was a queen; fit to be the wife of any man, was his second; why not of himself? was the third; and that she should be, if possible, was the fourth. Yet how to proceed, was the difficulty; he felt, with all the keen sensitiveness of an Englishman to absurd situations, that he was somewhat absurdly placed at the present moment; for Teresa, calmly pursuing her work, gave him no opportunity of addressing her without bringing the eyes of the multitude upon himself and the handsome maiden.

IV.

Teresa was the one to break the silence. She feared the pestilential breath that comes with the chill blasts and heavy dews after the burning heat of the day might take effect on Lionel Merton. She noted a lassitude and feverishness which he imputed to his state of mind, and suddenly she appeared before him.

"Signore, you will flee from hence or you will die!"

"And you will have killed me, Teresa."

"No; it is the poisonous mists of the Campagna."

"What brought me hither to breathe them?" asked Lionel, abruptly.

"The signore forgets that I begged him not to think of so rash a scheme," replied Teresa, evading the question. "For me who am accustomed to the changes, it is safe; for the signore it is death, and he must go."

"Whither?"

"Back to Frascati, if he so wills it; or, better, perhaps, away from Italy."

"I cannot live away from Italy; it is my life, my hope; and here I can study art and make myself a home. Here I can be happy, and yet you send me away!"

"I have told the signore that I am not fitted for his wife. Besides, my duty is to my parents; I must tend them until they die."

"Yet you leave them now?"

"Only for their benefit."

"It would benefit them more if you were my wife."

But Teresa shook her head mournfully. "*Non è possibile*," she said, decidedly.

"Yet you love me, Teresa?"

"Yes," said she with emotion, "but I must do my duty. I have made a vow not to marry so long as my parents live."

"It is a foolish vow," said Lionel.

"It is nevertheless a vow," she replied, firmly. "Signore, you must go. *Addio, addio!*"

But as she spoke a sudden shivering seized her the fever that she had dreaded for Lionel had fallen upon herself.

IV.

Teresa had but few friends among the laborers in the Campagna; but one woman, whom Lionel recognized as belonging to Frascati, was willing enough to undertake the office of nurse in consideration of the lavish payment for it, and to accompany her home when she was out of danger.

Then Lionel turned his steps northward, seeking no interview, for he knew that Teresa was firm in her resolution, and that it would be an insult to her piety and her sense of filial duty to attempt to shake it. So he hastened away, hoping by constant change and excitement to drive her image from his heart.

He passed the frontiers, and then the cold north winds began to blow and he could not face them, and Lionel Merton learned that his only hope of life was indeed in Italy. It seemed almost as though Fate were bidding him return, and so he passively resigned himself and retraced by slow stages the way to Frascati, delaying as he drew nearer and nearer to it, and yet with every intention of seeing Teresa once more.

He took up his residence at the inn again, but saw nothing of Teresa, neither did he hear of her until, upon making inquiries from the innkeeper, he found that immediately upon her return from the Campagna her parents had been taken ill and were now in the last stages of disease, and that they were poorer than ever. But Lionel shrank from intruding, although he and the old Cecchi had been very friendly.

Still Teresa had a consciousness of his presence in the constant supplies of all needed for the sufferers at the hands of the innkeeper, and she did not refuse them, for she was almost worn out with her vigil and perhaps regarded this unexpected assistance as an answer to her prayers, and therefore not to be flung ungratefully aside.

* * * * * * *

And then came the end. The Death Angel closed the old man's eyes and the mourner carried him to his grave—soon to be followed by the wife who had journeyed with him through the world And then Teresa was left an orphan, alone in the world. And then Lionel Merton once more said:

"Teresa, you love me?"

And Teresa replied, as she had done before, "Yes." But this time she added, "The vow that parted us is accomplished, and I am no longer forbidden to be your wife."—*Jean Bonearur.*

THE PROSPECTS OF TRADE.

There has been so much said about the improvement in business that Spicer has taken pains to interview the members of leading branches of business in the city with a view of obtaining practical and reliable information. The result of the inquiry into each branch of trade is given below:

In the oyster business the fall openings have been successful.

Dealers in indigo are looking blue.

The hatters say the greatest interest is *felt* in their business.

Crockery trade does not want a smashing business so much as a safe one.

The distillers say the Presidential election will be a spirited contest.

Paradoxical as it may appear, the ready-made clothing trade, although in favor of keeping open stores, are not opposed to a "close up" move.

Tea dealers think something steep will be done in that article.

"Extensions" continue to be made in the milk business.

The bakers need much and continue to look for a rise.

Hackmen report their business to be driving at this season.

On the other hand, dealers in paper, pens, and articles for counting-house use, say their trade is stationary.

Rubber dealers report great elasticity and those who have gutta percha sir claim water proof it is of good business.

Lead is heavy as ever this season. Several dealers who have compromised with their creditors, say they "brought their pigs to a bad market."

The sole report from the shoe trade is that every movement on foot will improve its prospects.

The canvas of the artists shows that they are getting on easie-y.

Whether the butchers will stay here or not we cannot say, but many of them are looking for fresh quarters, and say they cannot sell without fairly slaughtering their merchandise.

Barbers report a close shave during the summer, and that but few of their customers come to the scratch.—*Boston Com. Bulletin.*

HAD NO FUN IN HIM.

One of the members of the Methodist Conference, recently held here, was out for a walk at an early hour one morning, and while on Howard street he encountered a strapping big fellow, who was drawing a wagon to the blacksmith shop.

"Catch hold here and help me down to the shop with this wagon and I'll buy the whiskey!" called the big fellow.

"I never drink," solemnly replied the good man.

"Well, you can take a cigar."

"I never smoke."

The man dropped the wagon tongue, looked hard at the member and asked:

"Don't you chew?"

"No, sir," was the decided reply.

"You must get mighty lonesome," mused the teamster.

"I guess I'm all right—I feel first-rate."

"I'll bet you even that I can lay you on your back," remarked the teamster. "Come now, let's warm up a little."

"I never bet."

"Well, let's take each other down for fun, then. You are as big as I am, and I'll give you the under hold."

"I never have fun," solemnly answered the member.

"Well, I'm going to tackle you anyway. Here we go!"

The teamster slid up and endeavored to get a neck hold, but he had only just commenced to fool about when he was lifted clear off the grass and slammed against a tree-box with such force that he gasped half a dozen times before he could get his breath.

"Now you keep away from me!" exclaimed the minister, picking up his cane.

"Bust me if I don't!" replied the teamster, as he edged off. "What's the use in lying and saying that you didn't have any fun in you when you're chuck full of it! Blame it! you wanted to break my back, didn't you!"—*Detroit Free Press.*

LORD HOUGHTON ON THE UNITED STATES.

Americans are growing more like one another and all more like Europeans. The late terrible events have had a palpable effect in sobering down the vivacity, in checking the familiarity, in dignifying the demeanor of the community. You hardly meet with a man of mature life who has not been under arms on one side or the other, and the general military bearing is conspicuous. There is none of the very natural garrulity of the olden time, which sprang from a good-natured curiosity as to the conditions of existence in what was almost another planet, but which is now familiar to thousands. The general commodiousness also affords no opening for the small comments and discussions incidental to the discomforts and chances of travel in a less civilized country. The railway carriages are supplied with conveniences to which ours are strangers; indeed, iced water is not a luxury but a necessity, which the Americans most sadly miss in a European summer; the unexampled cleanliness of the masses (in Philadelphia alone the towns supply water for forty thousand baths, most of them in what we should call artisans' dwellings) carries with it a physical self-respect that preserves a general decorum, and the offensive habit, of which so much has been said, but which was in the United States just the same and no more than in Germany and in other tobacco-smoking populations, is now kept under due restraint, and there is nothing to remind us of the American traveler of some twenty years ago, who was so indignant at the affectation and prudery of English men and women in this respect, that though, as he stated, his medical adviser had desired him to abstain from it in consequence of his consumptive tendency, he never lost an opportunity of practising it in England to show his contempt for our aristocratic insolence. The traveler has nothing to grumble about except the expense of the hack-carriages, which he will compare with our cabs, whereas they really correspond to the *remises*.—*July London Quarterly.*

The Literary World.

RECENT LITERATURE.

Letters Descriptive of Central Mississippi. Compiled by M. B. Hillyard, and published at McComb City, Miss. (Paper.—pp. 203.)

All who are interested in the portion of the country described will find these letters quite valuable. Statistical and chatty too are their proper name, and any one who contemplates a move into a new district would do well to read this pamphlet before deciding upon the locality.

The Iron Trail. By A. C. Wheeler. New York: F. B. Patterson.

This is a little pamphlet, beautifully illustrated and neatly printed on elegant tinted paper. It is written evidently as a first-class puff of certain Western railroads and their lands, but in Nym Crinkle's happiest vein. In this work he shows an ability to praise railroads almost equal to his talent for abusing actors and plays.

United States Newspaper Directory. Chicago: G. A. Cook & Co.

This is a useful book to publishers and newspaper advertisers. It gives the name, style and circulation of the newspapers of the United States, and appears to have been compiled with much care. Messrs. Cook & Co. deserve great credit for their enterprise.

COMING EVENTS.

Scribner & Co. promise some pleasant surprises. A new novel by Dr. Holland, "Nicholas Minturn." "Twelve Hours with the Microscope" will be a series of papers contributed by Sophia B. Herrick, and handsomely illustrated. "Sketches of Foreign Travel," by Gen. McClellan. Prof. Proctor has commenced a series of papers in "St. Nicholas," "The Stars of the Month," which promise to be a great feature.

A new thing from Boston: The teachers are endeavoring by the free use of pamphlets to popularize the metric system of weights and measures. The propaganda is under the direction of the American Metric Bureau.

Rev. Edward Abbott has in preparation a series of books for young folks. They will be warmly welcomed by all who are familiar with the peculiar gifts of his pen, and especially as a grateful change from the highly sensational literature on which the juvenile mind has been accustomed to feed. The books will combine practical instruction and entertainment, somewhat after the character of the famous "Rollo" and "Franconia" stories of his father.

Albert Welles of the Society Library, N. Y., is about to publish the "Pedigree and History of the Washington Family." This will be authentic.

The Domestic Monthly, published by Blake & Co., 549 Broadway, is an excellent publication, devoted to fashion, etc.

The World Publishing House, 139 Eighth St., N. Y., is issuing some marvelously cheap editions of standard authors. They will shortly begin the publication of a new child's paper, Chatterbox, Junior, which will be handsomely illustrated, and prove a new source of pleasure to the young folks.

Jas. R. Osgood & Co., Boston, are preparing a very tempting programme for the fall and winter. Ticknor's Life is delightful reading. Longfellow's editorial venture, Poems of Places, promises to be charming. The "Little Classic" Series grow even more rich and varied as they advance.

Sabbath Reading.

FOUR DESTINIES.

A widowed mother sat one night,
Wrapped in the glow of the ingle-light,
With four brave sons about her chair,
Gentle and truthful, as they were fair.

A serious thought was in her brain,
She turned it o'er, again and again;
O, that I knew what was in store,
When I'm dead and gone, for these brave boys four!

She looked in the fire—folk say that fate
Often glares out from the ingle-grate—
When something said to her "Put the quest',
What would they each do for the best."

She turned her round, and called the boys
From their household humors, their household joys,
To sit beside her, and give their thought
To the question the fire in her brain had wrought.

"Pray tell me, my children four, my pride!
Sitting here by the ingle-side,
What would you, each of you, like to be
In the coming time—in futurity?"

"I," said Tertius, "would wish to be
A municipal dignitary,
And ride abroad in a gilded coach,
All men bowing when I approach!"

"And I," cried Bayard, "would rather be
A chief in the fields of chivalry;
Would wear the warrior's laurel-wreath,
Won from the foe in the face of death!"

Now spake Horace—"O! let me be
A voice in the halls of minstrelsy,
And sing to the world of nobler things
Than pertain to heroes, or civic kings!"

Bunyan was silent, "'Tis your turn now,"
The mother, with a curious brow;
He wrote on the slate but said not a word—
"Let me, like Samuel, strive for the Lord!"

The gleam of joy in her face that shone,
Was a thing for the saints to look upon;
Her glance went up, high overhead,
And these were the only words she said:

"Ah, well! my children four, my pride!
Seated here by the ingle-side,
Labor and wait;—Good-night! good-night!"
And they went to their beds in the pale moonlight.

Tertius mounted with steps elate
The throne of his hopes, and ruled in state;
Was king for an hour—then sat him down,
A thing forgotten by half the town.

Bayard, brave in his young life's prime,
The sword unsheathed in a foreign clime;—
And, fighting fell, with the swelling cheers
Of victory ringing in his ears.

Horace laid his hand on the lyre,
The strings they thrilled with a hidden fire—
His voice was heard in the halls of fame,
And the world paid tribute to his name.

Bunyan followed where duty led,
At His feet who for sinners His dear blood shed:
Souls were his glory—souls he won,
And the choir of Eternity sang—"Well done!"

HOW TO DISCOURAGE YOUR PASTOR.

1. Hear him "now and then." Drop in a little late. Do not sing; do not find the text in your Bible. If you take a little sleep during the sermon, so much the better.

2. Notice carefully any slip he makes while you are awake; point out the dull portions to your children and friends; it will come around to him.

3. Censure his efforts at usefulness; deplore his want of common sense; let him know that you won't help him because A. B. does, because you were not first consulted, or because you did not start the plan yourself.

4. Let him know the follies and sins of his hearers. Show him how much he overrates them and tell him their adverse criticisms on himself.

5. Tell him when he calls what a stranger he is; how his predecessors used to drop in for an hour's chat and how much you liked them.

6. Occasionally get up a little galety for the young folks. This will be found very effectual about the communion season. "There is a time to dance."

7. Give him no intimation when you are ill; of course he should know; and your offended dignity, when he comes to see you, will render his visit pleasant. On no account intimate your recovery.

8. Require him to swell the pomp of every important occasion unless, indeed, there are prudential reasons for passing him over.

9. If he is always in his pulpit clamor for strangers. If he has public duties and sometimes goes abroad, complain that he is never at home.

Patient continuance in courses like these, modified according to circumstances, has been known not only to discourage but to ruin the usefulness and break the spirit of ministers; to send them off to other charges and often to their graves. Those who desire to avoid such results should avoid the practice of such things as are here referred to. Let us "help one another."

Sin is to be overcome, not so much by maintaining a direct opposition to it as by cultivating opposite principles. Would you kill the weeds in your garden, plant it with good seed; if the ground be well occupied there will be less need of the labor of the hoe. If a man wished to quench fire, he might fight it with his hands till he was burned to death; the only way is to apply an opposite element.—*Andrew Fuller.*

Sinful omissions lead to sinful commissions.

Ladies' Portfolio.

WOOD-VIOLET.

VIOLET delicate, sweet,
Down in the deep of the wood,
Hid in thy still retreat,
Far from the sound of the street,
Man and his merciless mood:

Safe from the storm and heat,
Breathing of beauty and good
Fragrantly, under thy hood,
Violet.

Beautiful maid, discreet,
Where is the mate that is meet,
Meet for thee—strive as he could—
Yet will I kneel at thy feet,
Fearing another one should,
Violet!

EXCEPTION TAKEN.

BY JACQUELINA.

MR. EDITOR:—According to your correspondent in "Ladies' Portfolio" of Sept. 23, the problem of the hour is, "How shall we educate our girls?" the solution—train them to be maids of all work. Retrenchment is in order; therefore, oh! young lady, although your brother is not called upon to curtail his wine and cigar expenditures, it is decreed that *you* shall forswear music, turn your back on the library and dedicate your life henceforth to cookery books and wash-tubs! Glorious destiny! who wouldn't be a woman? The piano is to be replaced by the range, an acquaintance with foreign languages and current literature is to be superseded by a practical knowledge of the arts of dish-washing and floor-scrubbing.

In fact, all the frivolities of intellectuality and aesthetics are to be done away with and the maiden of the future is to occupy her time and talents in the "nobler and more intelligent pursuits" of "making, washing and ironing shirts and cooking dinner." "Two stars" should emigrate to Germany. His ideal woman is to be met with there. How he would revel in the society of the dames of that land! "No smattering of languages or imperfectly rendered airs of the day" would offend his critical (?) ear; and as the nearest way to his heart is evidently through his palate, how he would warm toward his hostess as he devoured pastry, meat and vegetables done in the highest style of gastronomics!

Then too, the quiet unobtrusiveness of the matron of the house, her devotion to household affairs, the entire absence of any "airs or manners" would charm him. To be sure, she is decidedly coarse and unattractive in appearance—hands red as to color, distorted as to shape—complexion bearing close resemblance to underdone beefsteak—figure lacking form and comeliness; but all these are matters of minor importance. She is fulfilling her mission. Of what consequence is it that she sacrifices youth, beauty and grace in the weary round of household cares—is she not engaged in the noble work of making a selfish tyrant of her husband?

"Two stars" promises that such a wife "shall reap the highest attainable reward," which is, to say the least, somewhat vague. Now, in the case of our German sisters; as a recompense for a life devoted to their husbands and in the performance of the "real duties of life," they have the proud satisfaction (?) of being cited as a nation where husbands are more universally unfaithful and more contemptibly tyrannical than in any other civilized country. Cheerful sort of commentary on your doctrine, friend of the *two stars*. The "goody" man whose career you sketch is not entitled to an atom of the sympathy you lavish on him. If he deliberately took a society girl rather than one of the MARTHA stripe to wife, that is a matter which concerns him alone. It is for him, not for us, to inquire whether her education had fitted her to be a "helpmeet or a clog to his exertions," and here lies the root of the whole matter—if we girls didn't find a market for the graces and accomplishments of polite society at which you sneer, we would soon cease to practice them. If the divinity of the kitchen and laundry was preferred to us, we would adopt your suggestions instanter; but so long as men show a decided predilection in favor of elegant manners, white hands, delicate complexions, a knowledge of music, the fine arts and literature, to the exclusion of kitchen lore and practice, it is hardly fair to blame us girls. Homilist *two stars*, if there is any one at fault, the men are to blame. Address your communications on this subject in future to husbands, fathers and lovers.

Finally, dear old fogy *two stars*, did it never occur to you that notwithstanding all the preaching, with woman's sphere for its text, which has been inflicted on a long-suffering community, there are girls so utterly depraved as to despise the delights of housework, and who insist that it is no more incumbent on every woman to learn the ways of a household than for every boy to master carpentry, gas fitting and plumbing, because he will one day inhabit a house of his own, or tailoring because he has to wear clothes? The wretched girls aforesaid prefer to earn from five to eight hundred dollars per annum in stores and offices rather than to drudge in the kitchen [illegible]

Would be reformer, "two stars," you may as well give it up. I assure you we girls of America do not propose to emulate our German sisters, and as to "spheres," we intend to take our choice of them.

ADVICE.

RURAL READERS:—Now that the evenings are growing longer, I would like to speak a few words about the boys improving them. Will their mothers and sisters accept a few suggestions on the same subject? I have seen so many boys idling their time while indoors, that I feel that more care should be taken to make it profitable to them. Most children are attending school, and of course part of their time ought to be given to studying the next day's lessons, part to recreation and fun; but still, if properly economized, there will be a spare portion for useful employment. If the family is large, there will always be one at leisure who can read some interesting book aloud while the rest are sewing, knitting, &c., &c. But that way only one boy would be busy. If there is another or more, I would have him at work making something—a frame or bracket, perhaps. Show them that their work is appreciated and encourage them to do all they can to beautify their home. You will find they soon will take great pride in their work and you will be surprised at the progress they make. Give them card-board, zephyrs, &c., and teach them how to use their materials—mottoes, card-receivers, air-castles, look very pretty in boy's rooms and they will like them all the better if made by their own efforts. There is such a fear among boys of appearing effeminate, that manliness often gives away before it. Impress upon them that nothing that is useful and adds at all to another's happiness, is beneath them.

I know two boys whose mother has a great deal to do with her family cares and often they are called upon to discharge duties that would devolve upon them if they were girls. It is very pleasant to see them cheerfully helping "mother" wash dishes, &c., but it seems so strange that they would dislike to have their boy playmates see them doing it. I do not understand the cause of the fearing of being girlish, but think home influence has something to do with it.

In my next, I will tell you something that the boys can make that will be pleasant employment for them and far more beneficial than being on the streets evenings or in the house teasing the cat or dog, or lazily playing chequers. In the meantime, try to get the boys interested in some of the ways I have mentioned, and you will never regret you took the advice of DITESY.

BEAUTIFUL SNOBS.

BEAUTIFUL women are apt, sooner or later, to come to think that their personal charms should captivate, whatever their manners may be. The consequence is, that wise persons beware of fair faces and sylphlike forms, knowing that peculiarly sharp tongues may lurk behind red and shapely lips. Unfortunately, however, the majority of persons are not wise, and so the possessors of fair faces and sylphlike forms, continue to be extremely handsomely treated upon the score of their negative merits, notwithstanding that their conduct is often objectionable in the extreme. We are not prepared to dispute that their conduct may often be rendered objectionable, in order that the power of their charms may be thoroughly tested; but, after a time, their disagreeable qualities become chronic, and are exercised without any specific object had in view. The beautiful snob is one of those in whom certain disagreeable qualities have become chronic. Knowing that she possesses attraction of person, she appears to imagine that she has done her duty by her neighbors when she has decked herself out to the best advantage. When in a room, she is well pleased if she imagines that she is posed prettily and that her face wears that bewitching, though meaningless smile, which displays her teeth very strikingly, if it does not indicate her intelligence. Appreciating her own importance, she deems it unnecessary to affect an amiability which she is far from possessing. Thus, if your conversation bores her, you have no occasion to remain for long in ignorance of the fact, and it would be your own fault if you did not find out when she thinks herself a cut above you. Even if you are in the enjoyment of her favor, you must expect to be the recipient of a certain amount of polite insolence; you must also expect to be converted into ridicule when your back is turned. That even you, a favored one, should be made light of, is only natural, seeing that it is one of the fundamental articles of her belief that she is so incomparably superior to the majority of her fellows, that but comparatively few are fit to wipe the dust from her shoes. It is a pity that all her admirers cannot see the truth in its grim reality. The addle-pated individuals who will hover round her chair in a gang and pay her meaningless and lying compliments, would be all the better if they could realize the fact that she not only thinks but calls them the fools that they are. The few that resolutely decline to yield to her spell can afford to bear the condemnations which she liberally passes upon them.

It must be said however, to her credit, that she does not appear to have a very high opinion of the majority of those whom she conceives she has subjugated. People in whom she confides learn that her victims are the most absurd boobies, whose presumption is only equalled by their inanity; and her friends generally have the good sense not to dispute the point with her. Towards the members of her own she is equally charitable. According to her ruling, they are measurably inferior to her. At the same time, it is somewhat difficult to gather from her vague deliverances in what respect they are inferior.—*Youth's Sunday Times and Weekly Messenger.*

AN equivocation and a lie own the same mother.

Reading for the Young.

NEVER GIVE UP.

NEVER give up! It is wiser and better
Always to hope than once to despair;
Fling off the load of doubt's cankering fetter,
And break the dark spell of tyrannical care.
Never give up! or the burden may sink you;
Providence has kindly mingled the cup;
And in all trials or troubles bethink you,
The watchword of life must be, "Never give up!"

Never give up! There are chances and changes
Helping the hopeful a hundred to one;
And, through the chaos, high wisdom arranges
Ever success if you'll ever hope on.
Never give up! for the wisest is boldest,
Knowing that Providence mingles the cup;
And of all maxims, the best, as the oldest,
Is the true watchword of "Never give up!"

Never give up! though the grape-shot may rattle,
Or the thunder-cloud o'er you burst;
Stand like a rock, and the storm or the battle
Little shall harm you, though doing their worst.
Never give up! if adversity presses,
Providence wisely has mingled the cup;
And the best counsel in all your distresses
Is the stout watchword of "Never give up!"

LETTERS FROM BOYS AND GIRLS.

Hot Shot.

BOYS, did you read what Uncle TRUE said in his last letter to the boys and girls? If so, what do you think of it? I think it is a shame that none of the boys wrote a sketch of JOAN of Arc, when there are lots that could have done better than either one of the girls whose sketches Uncle TRUE published. Now, boys, do not let this happen again, but do your best to redeem yourselves. If the girls did do all of the writing, I am satisfied that the boys could have done it better. Now, boys, look at BESSIE MCLEAN'S sketch. She gives but one date in the whole of her article, and that is unimportant. She begins the sketch as though it was a work of fiction rather than a matter of history. She writes more in the form of eulogy than of an impartial historian. She is also rather too poetic to write the history of a plain, practical woman, as JOAN of Arc was. So, taking it all around, I am far from giving over the palm to the girls. Now, Uncle TRUE, give us another chance, and see what we can do; and boys, if he does give us another chance, improve it.—ONE OF THE BOYS.

[I would mildly remark to the nieces that it's a good rule when you see a head to hit it. ONE OF THE BOYS has taken off the gloves. Let us make it interesting all around.—UNCLE TRUE.]

The Sentiment in Quilting.

I HAVE never written you before, but I have often thought I would like to and ask if I might be a Cousin. I have read the RURAL during the past summer with much interest; and as some of the young men who have written did not know as much as they *might* about piecing bed-quilts, I thought I would just *try* and enlighten them a little. It is very true that just cutting up calico and sewing it together again, is foolishness; but if your friends give you pieces of their dresses that you would like to keep as a token of remembrance, or if you have a dress in which you have had some adventure, and want to keep it in remembrance, why not take a part of it and piece it in your bed-quilt? Please answer that, young gentlemen. Some people talk a great deal about things which they *think* they are posted about, but of which in reality they know nothing. I don't deny but what I am one of them; but I trust the girls will agree with me in this. Now I must tell you something about myself—is it too late? I am a girl (as you might well know), between thirteen and fifteen years of age, with light hair, blue eyes and pug nose, and am rather tall. I have been spending the summer at my grandfather's, within a mile of Lake Ontario. In the summer and fall the sunsets are beautiful on the lake. I have often gone down to the end of the orchard just to see the sunset. It has been very dry here during the summer. Hoping I shall see this in the RURAL, I remain—COUSIN GYPSY BELLE.

Culture for Farmers' Boys—Solid Sense.

THE letter from Cousin R. C. P. has prompted me to take up my pen. I am glad he is cultivating his mind as well as his garden. I am a farmer's boy, and know all about the endless round of drudgery which devolves upon a farmer's boy. I know by experience what a boy thinks when the patient cow which he is milking suddenly transports him to the opposite side of the barn, with more speed than courtesy, and the half-filled milk pail comes flying after him and alights bottom up on his ear. Such petty annoyances are the unavoidable accompaniments of farm life, and are discouraging to any boy; and yet I would not

"Renounce the odors of the open field
For the unscented fictions of the loom,"

or of the store either.

R. C. P. advises the farmers' boys to study "something scientific," and to strive to become "prominent men," as a remedy for discontent, and says that after studying Botany and Landscape Drawing less than a year, he can associate with "ladies and gentlemen" who were once the cause of all his troubles. Surely he will soon be a "prominent man of our time." Now I have been studying several branches of Natural Science for over three years, and have not become a prominent man yet; but I am not going to leave the farm for all that. This desire of farmers for prominence is the ruin of many of them. I know of four farmers in this vicinity who have made assignments this summer. They borrowed money to "put on style," and neglected their business to ride about to show themselves.

Now, boys, "what I wish to remark" is this: Though our services may be required on the farm, so that we cannot acquire a school education, yet we may educate ourselves if we diligently improve all our spare minutes. I have a little library which I have bought, a book at a time, with my own money. In it are books of Science, History, Poetry, Agriculture, and a few classic novels. Here, by improving all my spare moments, I find time to study and write from one to three hours a day, besides working twelve to thirteen hours on the farm. Perhaps you would like to know what I write. Well, I write poetry; not with any thought of ever making a living by it, but for self-improvement. Boys, let us spend our leisure time in the pursuit of knowledge, and though we may not all become famous, we *may* become men of erudition and culture.—YOUNG POET, *Kingsville, O.*

Accidentally Neglected.

DEAR UNCLE TRUE:—Will you print this among the letters from boys and girls? I sent one once before but it was not printed, and if *this* one should go into the waste basket, I think I shall give up. I see piecing quilts is the question in dispute at present. I think it is a good and pretty way to use up the pieces; and there are sure to be a great many left after cutting dresses—pieces too small for any other purpose that I know of. Can YOUNG ARTIST tell us some better way to use them? CORA A. L. speaks of some very pretty Morning Glories. I never saw any like them. We have quite a nice flower garden, and have blue, white, red, pink and spotted Morning Glories—two or three shades of the red and blue ones. We have some house plants, but they hardly ever flower in the winter. I love flowers very much. We have beautiful wild flowers here in Michigan, among which are the Spring Beauty, Anemone and Hepatica. I have often read of the Hepatica, but it is always spoken of as a blue flower, and we have pink and white ones here as well as blue, and the lighter shades are the most common. But all of the spring flowers are gone now, and it is time to collect leaves and ferns for our winter bouquets. I always iron the leaves. I think they keep their color much better than when they are pressed. But——Oh, dear me! I have written such a long letter I must stop, or you will not print it. I hope to see this in print soon, and if the Cousins will receive me I may perhaps write again sometime.—VIRGINIA, *Maple Grove, Mich.*

Our Scholar.

MR. EDITOR:—Please give me an introduction to the Cousins of the RURAL. I shall certainly feel honored if I am allowed to assume the title of Cousin. We have taken your paper for more than ten years, and find it exceedingly valuable. I live on a farm, but do not relish farm work. I have a pleasant home; also a large library filled with choice literature and art, in which I spend my odd moments. I am also learning to pencil, and have mastered the rules in drawing and perspective, and I hope some day to reach the highest standard. Well done, Mdlle. GERALDINE; let us hear from you again. YOUNG TOM, to the front, sir, and defend yourself—though you do deserve it. WALTER P. inquires the meaning of debottement. SURENNE defines it in his French Dictionary as disjointing, dislocation.—MONSIEUR ALBERT.

Another.

COUSINS:—This is the first time I have made my appearance among you, and perhaps you hope it will be the last. I am a Northern New York girl, living on a farm four miles from the St. Lawrence River. I have noticed that most of the Cousins describe themselves, but I shall not, as I do not think any one would be particularly charmed with the description. I, like some others, am in my teens. I am very fond of music, but never have had an opportunity yet of cultivating my taste for it. I think YOUNG ARTIST'S letter was splendid, and hope she will favor us with another. If Mr. Editor will please print this, he will greatly oblige—BLUE JAY.

[YOUNG ARTIST must have a heart of stone to resist these numerous appeals.—UNCLE TRUE.]

From the Pacific Slope.

DEAR RURAL COUSINS:—I wrote to you some time ago, but did not tell your where I lived. I will tell you this time. I live in Washington Territory, on White River. My papa's farm is about twenty miles from Seattle. I am glad we Cousins are going to have more room. I did not think we had enough before. I think our columns are becoming the most interesting part of the whole paper. I am a real farmer's girl, and love the country very much. I can whistle as well as either of my brothers. I have two large brothers and one who is a little baby, three months old. My kitty's name is "Quimbo," and my canary's is "Jonathan." Hoping Uncles MARK and TRUE will not think this unworthy a place, I will close. —CARRIE A.

From an Ohio Girl.

I HAVE never written to the RURAL before, so I thought I would write. I do not think that WILD CRAB can work in the field any more than I can. My father is a farmer. We live about five miles from Newark. We take the RURAL, and all like it. If I was a boy, I wouldn't let the girls do all the writing. I think piecing quilts will do for those who like to, but for my part I don't like it very well. I go to school, and like flowers.—ANNA MCM., *Newark, O.*

Delights in Quilting.

DEAR EDITOR:—We have been taking your valuable paper some time, and I have been very much interested in the letters from boys and girls; so I thought I would write, too. I live on a very large farm, and we raise a great deal of poultry. I have raised a nice flock of turkeys this year. They are very troublesome, but I like to attend to them. I am glad to see some of the Cousins like to piece quilts; I delight in it. I have two lovely ones on hand now; both are nearly finished. We were visited by a terrible storm last Sunday; it did considerable damage. I start to school soon, and continue until June.—ROSA L., *Kempsville, Va., Sept.* 23.

Again!

DEAR COUSINS:—It is quite a while since I wrote to you, but I have been trying to write ever since I saw YOUNG EDITOR'S letter. He is enough to wake any boy up, and I hope he will succeed in arousing others who are bashful. I think he ought to have an arrow painted on each side of his boat, to let everybody know it is swift. I hope, Y. E., if you go to the Centennial, you will let us know all about it. I wish you would send us a Puzzle, and each Cousin try to guess it. I am sure you could. I hope LENA B. C. will tell us all about her leap-year parties.—WALTER P., *Ills.*

Welcome!

DEAR UNCLE AND COUSINS:—I have been thinking I would write a letter to the RURAL, and have commenced two or three, but have never finished them. I am very fond of music. I have a melodeon now, but I am going to have a piano this fall. I also do a great deal of fancy work. This is the first year we have taken the RURAL, and we like it very much. I am thirteen years old, and weigh ninety pounds. As this is my first letter to the RURAL, I hope to see it in print. I fancy it will not be rejected on account of its *length*. With kind wishes to all the Cousins, I remain—WILD HAWTHORN.

A Suggestion for Y. E.

As I have a few minutes to spare, I thought I would write to the RURAL. I am a boy and live on a farm. We are through with our harvest. I went to a camp meeting last Sunday week, and expect to go to another next Sunday. I think the Golden Eagle would be a good name for YOUNG EDITOR'S boat.—WILD PLUM.

The Puzzler.

MYTHOLOGICAL ENIGMA.

I AM composed of 59 letters:
My 22, 52, 3, 12, 16, 15, 42, 5, 1 sea nymphs.
My 7, 37, 59, 17, 44, 13, 29, 20 a king of Phrygia.
My 21, 2, 9, 11, 24, 29, 20 king of Athens.
My 8, 12, 10, 6, 18, 52, 27, 44, 25, 12, 1 an Egyptian god.
My 11, 35, 33, 28, 59, 34, 44 an Italian deity.
My 31, 41, 55, 12, 43 daughter of Athamas.
My 30, 50, 23, 51, 15 Tutelar deities.
My 26, 58, 57, 47 a beautiful priestess.
My 38, 15, 39, 46, 18, 16, 29, 1 son of Loamedon.
My 36, 13, 22, 4, 9, 51, 20 plants presided over by a goddess.
My 56, 19, 6, 40, 59, 12 a nymph beloved by Apollo.
My 45, 49, 19, 13, 54, 37 one of the muses.
My 53, 37, 10, 6, 15, 12, 20 rapacious monsters.
My 19, 6, 47, 18, 55, 28 a youth beloved by Mars.
My 48, 44, 29, 59, 19 a prophetic goddess of the Latins.
My whole is something about Niobe.

☞ Answer in two weeks. S. C.

PUZZLER ANSWERS.—Sept. 23.

ILLUSTRATED REBUS.—A little misunderstanding between two friends.

HIDDEN CHAMBER ARTICLES.—1, Carpet; 2, Pillow; 3, Chair; 4, Table; 5, Feather bed; 6, Pitcher; 7, Wardrobe; 8, Bowl; 9, Marseilles counterpane; 10, Sheet; 11, Washstand; 12, Towel rack; 13, Toilet mat.

TRANSPOSITION.—
How wild and dim this life appears!
One long, deep, heavy sigh,
When o'er our eyes, half closed in tears,
The images of former years
Are faintly glittering by!
And still forgotten while they go!
As, on the sea-beach, wave on wave
Dissolves at once in snow.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

THE following is a graduated scale of prices for small clubs according to the reduced rates of subscription for the RURAL NEW-YORKER. This is done for the benefit of the small clubs in thinly-populated districts. Let each subscriber add two or three names to his own and remit for all at one time.

No.	Single Price.	Small Clubs.	No.	Single Price.	Small Clubs.
1	$2. 50	$2 50	6	$15 00	$13 20
2	5 00	4 90	7	17 50	16 05
3	7 50	7 20	8	20 00	16 80
4	10 00	9 20	9	22 50	18 45
5	12 50	11 25	10	25 00	20 00

News of the Week.

HOME NEWS PARAGRAPHS.

THE assertion is made that there are 2,000 deserted farms in New Hampshire, or seven per cent. of the whole number. Many have been acquired by moneyed institutions through foreclosure. Several ways for selling them on long credit have been devised, combined with the introduction of new industries that would make payments easy by the purchasers.

John Waldemire of Rochester married after sixty years of single life. He had rigid ideas of economy, as shown in sending his wife with three cents to get meat for dinner, and five cents for wine. All the time his bank account was large. Mrs. Waldemire bore with his penuriousness for three months, and then parted with him; whereupon he hanged himself.

A Boston tea firm have adopted the idea of giving to every one who purchases anything at their establishment a cup of fine coffee with rich cream. Another Boston firm, probably favorably impressed with the liberality of the first-named firm, and desirous of emulating their example, pay their shop girls $3 per week, and then charge them five cents each per week for iced water.

Capt. Bates and his wife, formerly Miss Anna Swan, the giants, whose marriage in London attracted much attention several years ago, have retired from show life, and built a fitting residence near Rochester, N. Y. He is seven and a-half feet high, she is an inch taller, and each weighs over four hundred pounds. The rooms of their house are eighteen feet high and the doors twelve feet. Their bedstead is ten feet long, and all the furniture is proportionately large.

Mr. L. Rossiter, a Chicago refiner, publishes a statement as to the adulteration of sugar. He says that most consumers judge of sugar by its appearance, rather than by its intrinsic value, buying what is known as "coffee crust," in preference to the raw West India, which has more saccharine matter. In whitening sugar sulphur and like reagents are used, and then other chemicals are applied to obliterate the traces of the first. Much of the sugar is injurious.

A colossal group just executed by Mr. M. Ezekiel of Rome, entitled "Religious Liberty," is the gift of the Jewish people of the United States (represented by the great society of the Sons of the Covenant) to the national Government, as a sign of gratitude for the religious freedom enjoyed under the shadow of the American flag. The sculptor, a native of Richmond, Va., will accompany the work to Washington, where it will be set up on some prominent site before the close of the Centennial year.

A wild duck which was flying down a stream at Westport, Conn., a few days ago, struck a telegraph wire, which was stretched across a bridge, with such force that its head was severed from its body. A passer-by found the bird, and had it cooked for supper.

The Boston school committee has voted a salary of $1,000 to James Robinson, aged 95, and an old teacher. The old gentleman is dependent on his money, and is left to believe that he is still liable to be called on to teach arithmetic and book-keeping.

John Stoneskil, the tramp arrested on suspicion of wrecking a train on the Albany and Susquehanna Railroad, near Afton, confesses that he threw the train off the track. He says it was his purpose to plunder the train after wrecking it. He is a big, strong fellow, a life-long tramp, and had in his possession a memorandum book with drawings of claw bars, crow bars and other track tools, and a list of stations on several railroads, the Erie included.

The Clifton Mills at Cohoes, which cost twenty years ago $150,000 to construct, have been sold by auction, under a mortgage foreclosure judgment, to William White for $54,500.

According to Adjutant-General Slide there are 3,793 fugitives from justice in Texas.

Dramatic entertainments for the Savannah sufferers are all the rage in the South.

The authorities of Davenport, Iowa, have built a hospital to be conducted by the Sisters of Mercy.

Vinnie Ream's brother Robert has distinguished himself by killing a noted desperado at McAllister, I. T.

The Utah immigrants who settled in Arizona are dissatisfied with the country, and are returning in large parties.

Two members of a Boston jury caroused in a house the proprietors of which were to be tried before them for maintaining it in a disorderly way.

The iron imitation of a Palmetto tree in Charleston has been reconstructed, and wire moss has been added, giving it a surprisingly natural appearance.

Chinamen violating the cubic-air ordinance in their habitations at Portland, Oregon, are heavily fined, and, in default of payment, put to work on the streets.

William Crafts, the once-famous colored man, who for years past has collected money from people of the North ostensibly for the benefit of a farm-school for colored people in Georgia, is declared by respectable white and colored persons in Georgia to be a fraud. They assert that he and his family live on the money, and that not one cent goes to charity.

The statistic fiend has discovered that there are 929,940 horses, nearly 2,000,000 cattle, 1,000,500 hogs, 17,575 pianos, 21,608 melodeons, 155,728 sewing machines, and $50,000 worth of diamonds in the State of Illinois.

Two girls took arsenic in Newport, Ind., last spring, and one died at once, before the romance of the event had lost its interest. Now the other has just prosily died of liver complaint brought on by the poison.

Michael Fisher of Lancaster, Ohio, was driving a wagon loaded with lime recently, when the wagon upset in a ditch with about two inches of water, and the lime slaked, burned up the wagon, and nearly destroyed Fisher's body.

This is what they call farming in Georgia: "Many country people are selling their eggs and butter to buy their bacon, and using the bacon to feed the hands who make the cotton, which is mortgaged to pay for the fertilizers used in making it."

Gen. N. B. Baker of Iowa, who died recently, had been Governor of New Hampshire, member of the Iowa Legislature, and, since the outbreak of the war, Adjutant-General of Iowa. He was tireless in his exertions in behalf of the grasshopper sufferers. His funeral procession was the largest ever seen in Des Moines.

According to the revised statutes of Illinois, any person who wagers money, or valuables of any nature, on the result of an election, shall be liable to pay a fine of $1,000 and undergo imprisonment in the county jail for a period not exceeding one year.

The Rev. A. B. Ffennell was shot dead within a mile of the Cheyenne river agency on the night of the 27th ult. Mr. Ffennell was a Protestant Episcopal missionary, who had been laboring among the Indians at that agency for several years with much success, and, as he was very popular, it is supposed that he was killed by mistake for some other person.

Cornell has decided to challenge the winners in the Cambridge-Oxford race, which occurs in March next. The challenge will be for fours or eights with a coxswain, as the Englishmen may decide, and for a four-mile race over the regular course from Putney to Mortlake.

FOREIGN NOTES.

A DEPUTATION representing the Protestant Missionary and Bible Societies had an interview with the Earl of Derby recently in relation to the intolerant regulations of the Spanish Government. Lord Derby, after pointing out the difficulties in which the Spanish Government is placed by the strength of the clerical party, and the vagueness of the wording of the article of the Constitution relative to religious toleration, said: "Nothing in the article, however, justifies the closing of Protestant schools, and I do not think the Government will so interpret it. Probably many cases of hardship are due to the over-zeal of subordinate officials. I think, with regard to acts of intolerance which are clearly not sanctioned by the toleration clause of the Constitution, that when the Cortes has formally proclaimed freedom of worship, subject to certain limitations, there can be no question that we have a right to interfere if their promise is violated. But a more difficult case is when the question at issue is the proper construction of the law. I personally have no doubt that it is an exceedingly forced and strained construction of the law to prohibit as an external manifestation singing in church, or worshipping with the door open so that passers by may look in. I think we have a right to claim that the law should not be construed unfavorably to the foreigners in Spain, because they undoubtedly have been encouraged to settle there upon the understanding that they should be free from this kind of annoyance. I suggest that where those affected think it worth while to remonstrate they should send in their complaint, and inquiry shall be made."

Cardinal Manning, who by many is regarded as the probable successor of Pope Pius IX., when recently preaching at Preston, England, strongly vindicated the Pope's temporal power, and held that he was virtually a prisoner in his own palace. "Yet they were told that the Pope was free, that the doors were open, and that he might go unmolested through the streets of Rome. Only let some foreign prince come to England, and, taking possession of the Queen's palace, tell her she was free to walk about the streets of London, what would be her reply? Would she not say, 'Yes, but not before you would quit this land and the seas separate you and me!' For thirty years the Pope had been tempted in every possible way to give up his temporal possessions and see; but he could not, for they belonged to the universal Church, was bound to keep them and stand by them."

The Tannus water, which is now largely drunk at court and in aristocratic circles in England, contains about 100 grains of carbonate of lime and 200 grains of common salt per gallon, thus being about five times as hard a water as the typical hard water of Great Britain. Prof. Wanklyn thinks that fashionable physicians should not fail to observe and study the effects of Tannus water. While it is said that the hard water of Kent, containing a large percentage of lime, is very wholesome for young persons, and the straight legs of Kentish children are attributed to its use, it is considered doubtful whether hard water is desirable for those more advanced in years. It has been said that it tends to produce goitre.

The Redoubtable, which was launched at Lorient, in France, Sept. 18, will be the most powerful iron-clad in the French navy. This vessel, the construction of which began in 1873, is 330 feet long by 70 feet broad. The iron plates each weigh twenty-four tons, and the iron ram attached to the bow is thirty tons in weight. The decks are bomb-proof, and are armed with eight guns, which can be pointed in any direction required. The engines, constructed at Le Creuzot, are of 6,000-horse power, and the screw measures twenty-one feet in diameter. There are special engines for working the helm, the windlass, and the pumps, and the total displacement of the Redoubtable in the water will be 9,000 tons, or a fourth more than the Ocean, hitherto the largest iron-clad in the French navy.

It seems to be a well-established fact that the last three or four years have witnessed a return of the Jews to Palestine from every quarter of the globe. The number going from Russia is entirely unprecedented. The Hebrew population of Jerusalem is more than double what it was ten years ago, and the movement is going on rapidly. Most of the city property is now in the hands of Jews, who have gone there from other countries, and in a few years' time they will probably be the owners of the whole city.

The revenue derived in England last year from the taxes on gold and silver plate amounted to £38,272,11s. 6d. This would almost cover the grants to the Dukes of Edinburgh and Connaught and Prince Leopold, viz., £40,000 altogether. Add to this the tax for carrying armorial bearings (a mere seal ring costs $3 a year), and the cost to the country of the Queen's younger sons is completely covered. Luxuries, for which Dr. Johnson always stoutly stood up, thus have their uses.

James Redford, ex-Member of Parliament and an extensive broker and lumber merchant of Canada, has absconded. His liabilities are heavy and mostly to farmers who had deposits with him. Several banks are also interested, but are said to be secured.

Father Beckx, the General of the Jesuits, is to be made a Cardinal.

The monument to Karl Wilhelm, the composer of the "Wacht am Rhein," was unveiled at Schmalkalden, Germany, on Sept. 2, the day of the Sedan-fest. The name of Schneckenburger, the author of the words of the song, is also mentioned on the monument.

The return of King George to Greece has been indefinitely postponed. It is rumored that the King has demanded the cession of Crete to Greece and the rectification of the frontier in Epirus and Thessaly.

The publisher of the Paris Tribune (a radical newspaper) has been sentenced to three months' imprisonment for an article which appeared in that paper insulting religion.

King Ko, sovereign over a portion of the Islan of Borneo, is shortly expected in Paris with a numerous suite.

The Viceroy of India contemplates putting the administrative abilities of educated natives to a practical test, by placing two districts entirely under their own government, excluding Europeans entirely, even from the highest offices. Native public opinion is more opposed to this project than that of the English.

The Shah of Persia, who, since his visit to Europe, has tried to govern his country on constitutional principles, has been terribly disgusted by the Sultan's dethronement through his ministers. He has ordered that not more than four Ministers shall meet at each Council, that these shall change monthly, and according to the latest accounts, the Shah has adjourned the meetings of his Council for six months.

Capt. E. Simpson, of the United States steamer Omaha, writes to the Navy Department, under date of Guayaquil, Ecuador, Sept. 10, that he arrived there on the 8th inst. and found the city in the midst of a revolution, the General in command of the troops in the city having issued a *pronunciamiento* to that effect with the support of the troops, and apparently with the consent of the people. On the following day a circular was issued to all foreign consuls in the city, notifying them that the Government of the Republic of Ecuador had been assumed by Gen. Ventimilla, and assuring them of the preservation of perfect order. Capt. Simpson is unable to give the department any account of the cause of this outbreak.

SEMI-BUSINESS PARAGRAPHS.

THE HIGHEST GRAND AWARD of the Centennial Commission was given to Wisner's "Tiger" Sulky Horse Hay Rake. Wisner is still ahead and the Tiger growls victoriously—he will be heard from the coming season from Maine to California.

LET IT BE KNOWN that Wisner has carried of the Grand Medal of Merit and also the Grand Diploma of honor on his Tiger Horse Hay Rake.

J. W. STODDARD & Co.,
Dayton, Ohio.

THE AMERICAN CENTENNIAL, 1876.

WHEELER & WILSON VICTORIOUS!

AGAIN the Wheeler & Wilson Sewing Machines triumph over the world. The Centennial Commission have officially announced the awards, and decreed for the new Wheeler & Wilson machine *two Medals of Merit and two Diplomas of Honor*. This is a double victory, and the highest award which it was in the power of the Centennial authorities to bestow. No other company received such a recognition in this department. More than thirty of the best producers of machines in this and other countries entered for competition and at Philadelphia in 1876, as at Vienna in 1873 and at Paris in 1867, Wheeler & Wilson lead the list. After a careful, rigorous and exhaustive examination, the judges unanimously decided that the superior excellence of these machines deserved more than one medal or diploma and, consequently, they recommended *two of each*. The Centennial Commission unanimously ratified the action of the judges, and the public will doubtless indorse the decision of these ablest of mechanical experts. A claim of equally distinguished honor by any other sewing machine company is only an attempt to hoodwink the people. Read the following, which stamps the "New Wheeler & Wilson" as the *Standard Sewing Machine of the world*. From the Official Report:

AWARDS TO WHEELER AND WILSON.

1.—A Medal and Diploma for the "NEW WHEELER & WILSON SEWING MACHINE," for the following reasons:

"*A Lock-Stitch Sewing Machine, unsurpassed in the fine workmanship of its parts, great originality, great adaptability to different kinds of work, both in Cloth and Leather, beauty of Stitch, ease and rapidity of motion, and completeness of display.*"

2.—A Medal and Diploma for the "NEW WHEELER & WILSON SEWING MACHINE" for Leather, for "*Superior quality of work in Leather Stitching.*"

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 30, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	89,457	Molasses	—
Whisky	2,879	Hides, bbls	1,071
Corn meal, bbls	3,060	Cut meats, pkgs	9,144
Corn meal, bags	759	Lard, pkgs	4,358
Wheat, bush	313,805	Tobacco, hhds	2,824
Corn, bush	716,874	do. pkgs	5,510
Oats, bush	307,500	Butter, pkgs	47,352
Rye, bush	67,173	Cheese, boxes	51,320
Malt, bush	51,010	Cotton, bales	18,262
Barley, bush	36,835	Rosin	4,522
Beans, bbls	4,503	Spts. turp., bbls	814
Grass seed, bush	5,251	Dried Fruits, pkgs	1,119
Beef, pkgs	828	Eggs, bbls	7,202
Wool, bales	1,615	Peanuts, bags	693
Hops, bales	2,613	Leather, sides	39,8 2
Pork, bbls	3,915	Sugar, hhds	—
Tallow	1,173	Oil cake	7,203

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEANS AND PEAS.—Exports of beans past week, 472 bbls.; since Jan. 1st, 40,527 do.; same time last year, 23,318 do. Exports of peas past week, 2,326 bu.; since Jan. 1st, 430,180 do.; same time last year, 259,721. Mediums have advanced for both old and new. Sales, however, are light; but holders are not pressing stock upon market. Marrows are not active, still shippers are picking up good parcels of old and well-cured new; the latter are 5@10c. higher. Pea beans are dull. White kidneys quoted as before. Red are salable at full late rates. Black or turtle soup beans quiet, with small stock. Green peas are more active and a shade higher. Southern B. E. P. have declined to $2.75 ₱ 2-bush. bag. Canadian peas steady. We quote:

Beans—New pea, $1.55@1.60; medium, $1.55; marrow, $2.05@2 10; old prime pea, $1.52; fair to good, $1.30 @1.40; prime mediums, $1.40@1.45; fair to good, $1.15@ 1.25; prime marrows, $1.85@2.00; fair to good, $1.65@ 1 80; prime white kid., $1.65@1.70; other, 1.25@ 1.50; prime red kidney, $1.70@1.75; other, $1.40@ 1.50; Lima (Cal.) $2.75@3. Black beans, $3.25@3.50. Canadian peas, bulk and bobd, 95@97c.; free bbls, $1.14@1.15. Green peas, $1.20@1.25; split do. $6.

BEESWAX.—There is no increase of demand and the moderate arrivals are marketed only at easy prices. Sales at 31@32c. for Western and Southern.

BROOM CORN.—The new crop comes in moderately but trade is slow yet; quoted at 4@7½c., as to grade.

BUTTER.—We are receiving the largest supplies of butter that ever came to this market, with the noticeable anomaly of high range of prices. Latterly there has been a lull in the demand and, in the opinion of a portion of the trade, matters are shaping easier. Still, the city is crowded with transient population, and as the full trade is young, the fine grades of butter may rule firm for a while. The pull folks rather strained the market by demanding 40c.; this sent a good many buyers to the offering of the half tubs, which gave that grade some support. There is a good deal of State offered at 25@28c., which is all it is worth, owing to its summery quality. A decline abroad has checked the export demand for Western, but this favorable outlet is not looked upon as dead. Some easing of prices will be likely to induce exporters back again. Compared with State, Western is somewhat weak.

We quote:—Choice pails, 36@37c.; prime, 30@34c.; poor to good, 25@29c.; creamery pails, choice, 38@40c.; good, 36@37c.; sweet cream pails, 30@35c. State firkins, choice, 32@33c.; fair to good, 25@30c.; do. half firkin tubs, choice, 33@34c.; fair to prime, 29@31c.; do. Welsh tubs, choice, 31@32c.; other, 25@29c.; Western creamery, choice, 35@37c.; other, 32@34c.; do. firkins, best, 22@24c.; other, 19@20c.; dairy tubs, choice, 26@27c.; other, 19@22c.; factory choice, 23@25c.; other, 16@18c.

State dairies quotable at 30@32c.

Export of butter past week 1,039 packages.

CHEESE.—This week's business has not been altogether satisfactory. Orders from the other side have been of a more restricted character, and supplies have been larger of most grades. On really fancy factories there has been no urgency to sell, they showing comparatively moderately in the supply; for this grade at the close 12½c., E@13½c. made, and on some exceptional lots still higher, but from this the market drops to 12½c. for fine, and on anything under fine there is considerable irregularity. Very good August made have been bought at 11c. and parcels available at this lower rate have been much sought after. Exports past week, 22,791 boxes.

Fancy factory, 12¾@12¾c.; fine, 12@12¾c.; good and prime, 11c@12c.; fair, 10@11c.; State farm dairy, fancy, 11½@11¾c.; good to prime, 10@11c.; fair and good, 9@10c. Western factory, good and prime, 9½@ 10¾c.; fair lots, 8¾@9¼c.; do. cheddar, choice, 11@ 11¾c.; do. flat, choice, 11@11¾c.

CURED.—Small fresh family or grocery packages bring 10@12c.; large casks offering at 8c.

COTTON.—Prices have fallen steadily on liberal offerings of the new crop; export trade tame, while spindles have been operating only as they could obtain comparatively cheap rates.

The latest quotations are:—September, 10 15-16@ 10 31-32c.; October, 10 31-32c.; November, 11 1-16c.; December, 11 5-32c.; January, 11 9-32c.; February, 11 15-32c.; March, 11¾ @ 11 21-32c.; April, 11 13-16c.; May, 12c.; June, 12 5-32@12 3-16c.; July, 12 11-32c.; August, 12 15-32 @12¾c.

DOMESTIC DRIED FRUITS.—Supplies still come in freely from the South, comprising largely low-grade quarters, which are salable at 4¾@5c.; shippers requiring repacked lots pay up to 6c. This trade, however, is very small. It is difficult to move sliced unless at low figures; the trade generally anticipating pretty heavy supplies. Peaches are without important dealing. Blackberries, raspberries and cherries hold to strong figures.

Apples—State, sliced, 6¾@7¼c.; do., quarters, 6¾@7c.; Southern sliced, new, 6@6¼c.; choice do. 7@ 7½c. do., new quarters at 4¾@6c. Blackberries, 8@8½c. Peeled peaches, new, nominally 13@14½c.; unpeeled peaches, new, nominal. Plums at 13@15c. Raspberries, 25@26c. Cherries, 16¾@17c.

EGGS.—The market has ruled very steady and prices are something better. Early in the week they were higher, but buyers then held all and sellers decided to meet them with the present satisfactory rates. Limed have no place as yet. When fresh Ohio's compare right with State they bring 26c. We quote:

Near points, 27@28c.; State and Penn., 25@26c.; Western, prime, 25@25½c.; do. other, 21½c.; Canadian, 24¾@25¾c.

ESSENTIAL OILS.—The following are the recently revised quotations:

We quote:—Peppermint, $2@2.25 ₱ lb.; Wintergreen, $2.50; Pennyroyal down to $1; Sassafras, 40 @42½c.

FERTILIZERS.—Wholesale prices:

Ground Bone, $27@30 ₱ ton; Superphosphate of Lime, $37.50; Peruvian Guano, $60; Poudrette, $22.50.

FOREIGN DRIED FRUITS.—New layer raisins, $2.10; half boxes do., $1.25; quarter do., 67½c.; new Valencia do., 10¾@10¾c. New currants, 6¾@6¾c. Citron, 23½c. Turkey prunes, 5¾@6¾c.

FLOUR.—The position of the market has been very satisfactory to sellers until within a day or two; supplies were rapidly diminishing under brisk export and home trade dealings, but the latest dealings show to a more meagre amount, the export demand especially subsiding, and there is a slight reaction from recent full figures. The trade think however, that a material decline is likely, and confidently expect a resumption of general trade in the near future, the last transactions are on the appended basis; $4.20@4.70 for poor to very choice superfine State; $4.90@5 for very common to fair extra do.; $5.05@5.10 for good extra do.; $5.15@5.30 for fancy do., and $5.35@5.50 for fancy to very choice extra; $4.20@ 4.70 for superfine Michigan Indiana, Iowa, &c.; $4.90@5.05 for shipping extra do., the inside price for inferior, and $5.10@5.40 for choice to very fancy extra do.; common to choice white wheat extras $5.45@6.30; fancy do. $6.55@7.75; winter wheat, good to choice family $6.00@7.50; round-hoop Ohio, $4.30 @5.00, and trade brands of do. at $5.05@6.75; St. Louis, $5.00@6.25 for common to fair extra, and $6.30@ 8.50 for good to very choice; Minnesota "straight" at $6.00@8.00, and patent at $7.00@9.50; unsound stock at from $2.75@4.75; city mill extra for West Indies at $5.90@6.25; do. English brands, $5.00@5.05; do. trade and family $6.50@8.50; No. 2 at $2.75@3.90. Corn meal—Brings $2.35@2.90 for yellow western, Jersey and Pennsylvania, $3.25@3.30 for Brandywine.

FRESH FRUIT.—Apples are extremely low especially with the improved inter quality. Prime marks ready to ship are quoted $1.50 ₱ bbl. Common open heads down to 40@62c. Bartletts are out, but other varieties are selling well with the usual advance that follows the departure of Bartlett. N. J. Peaches have only a week or so left. There is a good supply of California pears in market; Duchess and B. Clairgeau quoted at $3@4.50 ₱ bbl. Plums are most out. Few Quinces yet. Grapes have sold largely during the week some dealers depositing of 3 or 4 tons per day. There is further endorsement of a light crop of Cranberries.

Our quotation for Jersey berries are for standard packages branded "N. J. C. G. A.," the dimensions being for crates 8¾x12x22 inches, and for barrels diameter of head 16¾, of bilge 18¾, and depth 25¾ inches, inside measurement. Those packages not branded usually contain less berries and sell proportionally lower. We quote:

Apples, 20-ounce Pippins, Dut. Red and Blush, ₱ bbl., $1.50; mixed, good, $1.25; best river, 75@ $1.00; common open heads, wind falls, 40@60c. Pears Duchess ₱ ½, 7@10c. Seckel, $6@12; Louise Bonne, $5@8; Flemish Beauty, $6@9; cooking, $2.50@3. Peaches, extra N. J. $1.25@1.50. Good 75c.@$1.00; small 35@60c. Damson and Blue plums 5@7c. ₱ ½.; Cranberries, Cape Cod, ₱ bbl. $10. N. J. crate, $2@3.50; Grapes—Delaware, ₱ ½., 8@10c.; Catawba, 7@8c.; Concord, 4@6c.; Isabella, 4@5c. Peanuts, fancy Va., ₱ bush. $1.70@1.75; other $1.10@1.65. Chestnuts, ₱ bush. $5@6. Exports of apples, past week, 3,779 bbls.

GRAIN.—Wheat market is more favorable. The export demand is starting up, and the result is, with the moderate stocks, that stronger rates prevail. Latest sales are of ungraded and winter red Western at $1.10; new do. do. at $1.18@1.19; new amber Kansas at $1.23; new winter red Missouri at $1.20; extra white Michigan at $1.20; new amber Michigan at $1.25; new No. 2 Chicago spring at $1.19; new No. 1 do. at $1.22; new No. 2 Milwaukee spring, $1.19 is offered and $1.23@1.24 asked; $1.17@1.25 for No. 1 spring; $1.08@1.22 for No. 2 spring; $1.05@1.20 for winter red and amber; $1.15@1.30 for white. Rye is coming in freely and yields in price; latest sales at 70@73c. for Western, and 80@86c. for Jersey, State, Pennsylvania and Canada. Barley is held at full prices; No. 1 Canada, $1.20; No. 2 do. $1.11@1.15; six-rowed State at 95c.@1 for prime; boat loads and car lots of inferior as low as 75c. Barley malt selling at $1.05@1.07½ for six-rowed State, and $1.10 for fall Canada. Corn declining, although in fair export demand; sales at 55½@57c. for mixed Western; 58½c. for Kansas mixed, and 58c. for yellow. Oats active at strong prices; sales at 39@42c. for mixed Western and State, and 36@52c. for white do.

HAY AND STRAW.—Receipts run small, while requirements are larger and no trouble is found in sustaining current prices.

Bale hay is quoted:—Shipping, 60c.; retail qualities 75c.@$1; clover, 55@60c.; salt, 55@60c. Straw is quoted at 70@80c. for long rye; 55@65c. for short rye; 55@60c. for oat.

HIGHWINES bring $1.13 ₱ gallon.

HONEY.—The nominal quotations are 15@20c. for State White Clover Comb, and 8@12c. for Buckwheat. California invoices will soon be here.

HOPS.—The export this week has been 722 bales. The receipts are increasing fast, but they comprise largely grades under good, and it is apparent that less care has been taken in the picking. Exporters are disposed to buy moderately, but they exclude other than really fine lots thus we have some little accumulation this week. The appearance is more hopeful as respects the export trade and full rates are offered on the choicest lots. Brewers are at present working on the old supplies and doing but little in the new crop.

New York, good to choice, new	33 to 35
New York, low to fair, new	25 to 30
Eastern, new	25 to 30
Yearlings	10 to 20
Olds, all growths	4 to 8
California, new	33 to 35

LEATHER.—Hemlock sole at 18@20½c for light, 20@ 23c. for middle, 21@21c. for heavy, 17@20½c. for good damaged.

POULTRY AND GAME.—The quality of much of the arrivals of live is poor and prices are weak. A good many coops of turkeys show mixed sizes and they sell slowly. We quote:

Spring chickens, near-by, ₱ lb., 14@15c.; do. Western, 13@14c.

Fowls, N. J., ₱ lb 14@15c.; do. Western, 13@14c. Roosters, 8@9c.; Turkeys, N. J., 14@15c.; do. Western, 13@14c.; Ducks, N. J., pair, 75c.@$1.12; do. Western, 65@75c.; Geese, N. J., $2.00@2 50; do. Western, $1.37 @1.75.

Dressed poultry looks poor and the demand is moderate, with lower prices. Some scalded fowls and chickens quoted at 8@12c. There is a fair demand for good, dressed stock. We quote:

Dry-picked chickens, 16@19c.; scalded, good order, 14@17c.; dry-picked fowls, 14@18c.; scalded, good order, 14@17c.; turkeys, 13@16c.

PROVISIONS.—With the close approach to the new packing, prices are a little disturbed, and export trade is quiet. Mess pork quoted at $16.60@16.75 for spot lots; $16 10 for October; $15.50 for December. Bacon, 9½c. for long clear on spot; 8¾c. for short clear for November delivery, and 8¼c. for long and short clear together, December delivery. Lard, $10.05 on spot, for steam; $10 for November; $9.85 for December, and $9.90 for January delivery. Shoulder at $12 for prime. Tallow at 8¾c. for prime. Beef hams at $21. Beef—barrelled lots at $8@10 for plainness, $10 @11 for extra mess, $13.50@14 for packet. Tierced quoted nominal for prime, and India mess. City extra India mess at $22@23.

SEED.—New timothy has been in good export demand at $1.80@1.85, as to quality. The trade await with some little interest arrivals of new clover; meanwhile the old crop is held at 12½c. Rough flax is being placed in car lots at $1.41.

TOBACCO.—There are very full receipts, but exporters buy to a fair extent and the market is strong.

KENTUCKY LEAF—NEW CROP.

	Light.	Heavy.
Common lugs	6 @ 6¾	6 @ 7½
Good lugs	6¾@ 8	8 @ 9
Low leaf	8½@10	9½@11

Ohio assorted lots	6 @ 6¾
Wisconsin assorted lots	3 @ 5

VEGETABLES.—Exports of potatoes past week 2,691 bbls. Potatoes are low but in good demand. Sweet potatoes drag somewhat even at the reduced prices. It has not been a good week for miscellaneous garden produce. Cabbage lower.

Prime potatoes, N. Y. bbl., $2.25@2.75; western, $2.12 @2.50; sweet, $2@2 50. Corn, ₱ 100, $1.75. Tomatoes, ₱ bush. 35@50c. Marrow squash, ₱ bbl., 75c.@$1. Cabbages, ₱ 100, $4@7. New Russia turnips, ₱ bbl., $1.37 @1.62. Egg plants, ₱ bbl., $2@3. Cauliflower, ₱ bbl., $2@3. Yellow onions, ₱ bbl., $2; red, $1.50@1.62; white, $2.25@2.75.

WOOL.—As expected, after the heavy purchases recently, there is a temporary lull. The supplies have become so much reduced that no trouble is found in sustaining very full rates on the desirable descriptions or, more particularly, Western fleeces, combing and delaine. California grades generally and Texas sorts, and in fact, in instances still better figures asked. On the whole, the situation is much more satisfactory than had been anticipated at the opening of the season, and this has been brought about by the much better positions of the goods marked.

ROCHESTER, Sept. 30.—Flour market active; spring, $6.75; amber winter, $7.00; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.00. Wheat quiet; Milwaukee club, $1.10@1.21; amber winter, $1.03@1.15; white winter, $1.15@1.25. Oats, nominal at 38@43c. Corn quiet at 58@62c. Corn meal, $1.25 @1.50. Butter, 30@31c. Cheese, 14@16c. Eggs, 23@25c. Lard, 18@20c. Apples, bu., 40@60c. Potatoes, bu., 55@80c. Beans, ₱ bu., 70@$1. Mess pork, $17 25. Wool, 20@28c. Hay, $8@11. Straw, $6@8. Timothy seed, $1.90@2.25; clover, $6.00@6.50. Mill feed strong at $16 for shorts, $18 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 35c. ₱ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Sept. 30, 1876.

THE transactions at the Little Falls market for the week ending Sept. 30 have been brisk and the prices of the previous week are sustained. About 450 boxes of farm dairy cheese were on delivery and sales were made at from 10¾ to 12¾c., the bulk of sales going at from 11 to 11¾c.

There was a large number of factorymen on the market and the offerings aggregated upward of 10,000 boxes, nearly 9,000 of which changed hands. Sales began to be made at 12c., but rapidly rose to 12¾ and 13c. We give a portion of the sales as follows:

Eighty boxes at 12c.; 50 boxes at 12¼c.; 1,610 boxes at 12½c.; 100 boxes at 12⅝c.; 2,050 boxes at 12¾c.; 4,567 boxes at 13c.

The cheese was of fine quality and was mostly of August make.

Butter is now coming forward freely and sales have been made at from 28 to 31c., the latter price being paid for creamery.

The recent rains have helped grass, but cows have not increased in their yield.

We have recent advices from abroad. Our London correspondent says there is a brisk demand for the finest sorts of American cheese and prices are fully one to two shillings dearer. English cheddar is more inquired for, and Dutch sells at an advance. We give prices as follows:

American, extra fine, 52s@53s.; fine, 46@50s.; good, 40 @42s.; secondary, 30@38s. English cheddar, 80@86s.; Wiltshire, double, none in market; Edams, 62@64s.; Gouda, 54@56s.; Derby shape, 68@70s.

Butter is unprecedentedly scarce. Agents can name their own figure for th t landed.

Channels, 114@116s.; extra fine, 118@150s., Corks, 140 @144s.; Dorsets, 136s.; Jersey, 138s.; Friesland, 151@ 156s.; Normandy extra, 156s; American and Canadian, 112@120s. Oleomargarine brings 90@116s. ₱ cwt.

LIVE STOCK MARKETS.

" last week	11,995	56	2,247	39,021	21,923

BEEVES.—On Monday last trade opened fair; there was a steady demand for good quality beeves, which were scarce, with a slow sale for inferior quality steers, which were in over-supply. Prices ranged at 6¾@8¾c. ₱ lb.; weights, 5(scant)@9¼ cwt. Wednesday, trade slow at 6¾@8c.; weights, 5@9¼ cwt. Thursday, sales small, at 7¾@10½c.; weights, 5½@7¾cwt. Friday, the markets closed weak, prices having been 6¾@10¾c.; weights, 4¾@8¾ cwt. From 55@58 lbs., net, has been allowed Spanish herds, direct from the Plains, sold at 6¾@8¾c. ₱ lb. Colorado steers, 7¾@ 9c.; Illinois, grass-fed, 7¾@8¾c.; Native, do., 7@9c.; part corn-fed do., 9¾@10¾c.; grade do., 10¾@11¾c. Over 1,200 carcases were shipped for the London market during the past week. Bulls on live weight, 3¾@4¼c.

MILCH COWS.—On unusually light arrivals trade remains dull. Cows sold at $30@65 ₱ head. General sales, $45@55—calves included. Quality from poor to fair.

VEALS AND CALVES.—Smooth quality veals are scarce and continue in fair demand at 7@9¼c.; coarse quality calves in abundant supply and slow of sale at 3¼@6¾c.; also at 8¾@15 ₱ head. State calves sold at 3¼@6c.; Western, 4@5¾c.; State veals, 7@9¾c.; Pennsylvania, 8@9c.; Jersey, 8¾@9¼c.

SHEEP AND LAMBS.—On Monday last trade improved in feeling, but rates did not advance. Sheep sold at 4@6c. ₱ lb.; lambs, 5¾@6¾c.; mixed flocks, 5@ 5¾c. Wednesday, trade fair; sheep, 4@6¼c.; lambs, 5@6¾c. Thursday; sheep, 4@6c.; lambs, 5@6. Friday, the markets closed dull; sheep, 4¾@5½c.; lambs, 5@ 6¾c. The flocks to hand have been from fair to good, with a very few coarse quality bucks and ewes among them. State sheep sold at 4½@5c.; Illinois, 5c.; Michigan 4¾@5¾c.; Pennsylvania, 4¾@5c.; Ohio, 4¾@5c.; State and Canada bucks, 4c.; State lambs, 5¾@6¾c.; Ohio, 6c.; Jersey, 5¾@6¼c.; Canada, 6@6¾c.

HOGS.—Live, in small lots, 6¾@6¼c., quality coarse. Trade in city dressed inactive at 7¾@8¾c.; general sales, 7¾@8¾c.

HORSE MARKET.—The broken weather has again caused city trade in horses to fall off most heavily. Quotations of last week the same as this. Sales have been so few dealers hesitated to give quotations.

SPECIAL NOTICES.

"Wisner" is again top of the heap, and J. W. Stoddard & Co. will probably have as many orders as they possibly can fill; so that agents wanting territory for Wisner's "Tiger" Rake, should address, at once, either J. E. WISNER, Gen'l Agt., Friendship, N. Y., or J. W. STODDARD & CO., Dayton, Ohio.

New Advertisements.

PERSONAL ITEMS.

GENERAL BRAXTON BRAGG is dead; heart disease.

SPICY intelligence from Indianapolis—A Miss Peppers has eloped.

ERNEST BANDEL, the German sculptor, died at Donauwerth, Bavaria, Sept. 28.

COL. VALENTINE BAKER is the Constantinople correspondent of a London paper.

A MAN was killed in Georgia for stealing a kicking mule. The mule was the executioner.

MRS. HICKS, the wealthy American widow, is reported as about to marry Lord Henry Gordon Lennox.

MISS MINNIE PALMER is advertised in the West as "the most magnificent star in the dramatic firmament."

ANNA DICKINSON will soon appear in Utica in her new play, and if she isn't successful there will be a real tragedy.

MR. MOODY has supplanted Mr. Sankey with Mr. Stebbins as a singer, hoping to get over Jordan on Stebbins' tones.

BRICKMAKERS die very young, not because the gods love them particularly, but because theirs is such a kiln business.

A MAN who put his knife far into his mouth, while eating in a Boston hotel, was asked if he was a sword swallower.

SERGEANT THOMAS DARRAGH, one of the rescued Fenians, has taken out his first naturalization papers at Bridgeport, Conn.

IDA LEWIS still keeps the Lime Rock Light-house at Newport, R. I. She lives with her mother and her dogs, and is very fond of both.

A DEADWOOD CITY jury "honorably acquitted" a murderer who killed a man whom he mistook for the one that he intended to kill.

COLE YOUNGER, one of the Northfield bandits, old his captors that "if he hadn't been in that business he would have been a preacher."

MILK is slow stuff to steal when it has to be taken from the cow. Adam Greimer of Kentucky got shot in the leg the other night while doing it.

"No man can do anything against his will," said a metaphysician. "Faith," said Pat, "I had a brother who went to prison against his will."

WON'T Mr. Bergh kindly look after these inhuman riflemen, who have been shooting at bull's eyes over on Long Island during the last few days?

THE remains of Bellini, the composer, who died at Puteaux, near Paris, in 1835, have been exhumed and conveyed to Catania, Sicily, Bellini's birthplace.

"I WISH you would pay a little attention to what I am saying, sir," roared a lawyer at an exasperating witness. "I am paying as little as I can," was the calm reply.

MRS. AND MRS. FLEETWOOD of Texas held a national convention, and nominated Mr. Fleetwood for President of the United States and Mrs. Fleetwood for Vice-President.

AN old bachelor having been laughed at by a party of pretty girls, told them, "You are small potatoes!" "We may be small potatoes," said one of them; but we are sweet ones."

WE haven't had time to read our Bible very much lately, and we just want to know if it will be in order to call Butler's campaign in Massachusetts, "the widow's cruise?"—*Hawkeye.*

MRS. SALLY BEERS of Clinton County, Michigan, works a farm of one hundred acres and has nine children. If there were a few thousand such persons in the world as Sally, many more of us might escape work.

A NEVADA man, being commanded by a robber to throw up his hands, obeyed promptly, and concealed his money in them. The robber searched his clothing, but not his hands, and so got no booty.

PROF. CHARLES DAVIES, LL. D., long an instructor at West Point, and author of a number of popular mathematical works, died at Fishkill on the Hudson, on the 18th ult., in the seventy-ninth year of his age.

ONE POUND is announced as a candidate for Congress from the eighth Wisconsin district. He won't be in Congress long before he will find himself without scruples, though he will probably make it up in drams.

GENERAL HAMILTON said in a recent speech that the South did not fight for slavery in the late war, and that General Lee told him that, whether the South was victorious or defeated, the colored people would be free.

MR. CHARLES FRANCIS ADAMS, it is said, is as persistent in work as was ever his father or grandfather. Though he has a carriage, he seldom rides, and always walks five miles or more every day, winter and summer.

TWO women in Kansas had a prize-fight, with seconds, a referee, a ring, and six brutally contested rounds. Finally, one pulled the other's hair, which the referee declared was "a foul," and that ended the fight.

"JOHN," said a doting parent to her gormandizing son, "do you really think you can eat the whole of that pudding with impunity?" "I don't know, ma," replied young hopeful, "but I guess I can with a spoon."

MRS. MARY TILLOTSON, a burning and a shining light in the Free Dress League, has taken her better-half into partnership in her printing establishment at Vincennes, Indiana, and dubs the firm Tillotson & Husband.

MR. POGSON, the Government astronomer of Madras, carries his love of his science to such a pitch that he has his children christened in accordance with the names of the chief celestial bodies which he from time to time discovers.

A CLERGYMAN said the other day that modern young ladies were not daughters of Shem and Ham, but daughters of Hem and Sham—compounds of plain-sewing and make-believe. We would credit this if we knew the clergyman.

AH LEE of St. Louis, is what his name implies—a Chinaman. His wife is Irish. Of their progeny the boys are as unmistakable Pats as were ever baptized, and the girls are as clearly little Celestials as ever had their feet cramped in babyhood.

SAMUEL C. LEWIS of Pittsburgh, Pennsylvania, who helped to make the first bar of iron manufactured in the United States, has been invited by his friends to visit the Centennial Exhibition and be received formally by the representatives of the iron interest.

S. F. GILMORE of Escanaba, Mich., advertises a reward of $200 for his runaway wife, who took with her their little boy. The advertisement concludes:—"The reward above named will be paid for the recovery of the boy—and the woman can go to thunder."

A DOTING mother of a waggish boy, having bottled a quantity of nice preserves, labelled them, "Put up by Mrs. Doo." Johnny having discovered the goodies, soon ate the contents of one bottle, and wrote on the bottom of the label, "Put down by Johnny Doo."

"SOME things," said an excited politician, "can be foreseen and foretold; and I now foresee and I will now foretell, that the day will come when our liberties will be no more. This is as certain, my fellow citizens, and it is as sure, as that Romeo founded Rome."

AN Indiana man, who saw his wife fall off the bridge into a mill pond, never hesitated a moment about his duty, but with that noble impulse so characteristic of the sex darted down the road and prevented anybody from coming up to witness the harrowing spectacle.

IN a recent discourse Brigham Young said: "For forty-three years I have been more or less engaged preaching to the people. My talking organs are now pretty much exhausted, but my general health is even better than when I was a young man. I never felt better."

PRINCE LOUIS LUCIEN BONAPARTE has for many years been engaged in superintending the translation of portions of the English version of the Scriptures into the various dialects spoken in England and Scotland, and travels about Britain collecting information about these dialects.

IN British Columbia Elisha Munsell, a negro, is expected soon to receive the order of knighthood. He is the son of a former West Indian slave, and his wife's freedom was purchased by her father in Georgia while she was a child. He has amassed a large fortune, and is intelligent and cultured.

HE was fond of getting up little shocks for his friends, and this was one. "I would have been left all alone over night at that out-of-the-way station if I had not been lucky enough to catch that train. Fortunate wasn't it?" "Yes; did you have to run very hard to get it?" "Oh, no! I sat there fifteen minutes before it came along."

Implements and Machinery.

Centennial Year of American Independence,

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you samples of the Celebrated Watches, manufactured by our country-men, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION, These Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, fine Ruby Jeweled, set in Chaton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

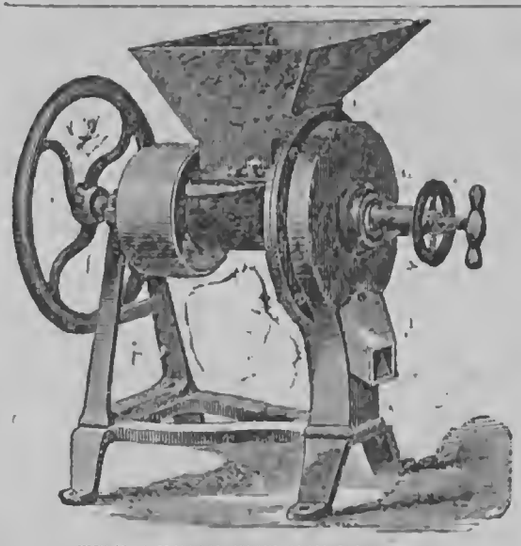
Sporting Rifles, Double and Single Barrel Shot Guns, Pocket Rifles, Pocket Pistols, and the noted Hunter's Pet Rifles. Send for Catalogue.
J. STEVENS & CO., Chicopee Falls, Mass.



THE ABOVE CUT REPRESENTS
THE VICTORY CORN MILL.

This mill will grind corn and cob rapidly, course and fine; also, all other kinds of grain or seed. Capacity, 10 to 20 bushels per hour. It is made entirely of iron, except the hopper. It is strong, durable, and not liable to get out of repair. It will grind more feed with less power than any other mill in the market. This is no humbug. We warrant it to do what we claim. Agents wanted everywhere. Price $40, delivered on cars at Springfield. Address
T. ROBERTS & CO., Springfield, Ohio.

☞ We also manufacture 4½ horse-power Vertical Portable Engines, suitable for running these mills, or for any other purpose for which power is required. Price $250.

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

D. S. K.—We would advise you to advertise in the RURAL NEW-YORKER for a farm, stating the number of acres and other particulars, as given in your letter of inquiry. We presume just the kind of farm desired could be found in the way named.

S. B. P.—The grape leaves sent show no signs of depredations by the Phylloxera, but have been badly infested with what are called "Thrip." The phylloxera, when it attacks the leaves, causes small excrescences or warts, which are the temporary habitations of the insect. The root form of this pest causes small warts on the smaller rootlets, preventing the free flow of sap, which of course checks the growth and eventually kills the vine, unless it is of a very vigorous sort and capable of resisting the attacks of the pest.

Gardener.—Melon, cucumber and squash seed will remain good for several years if kept in a dry place. Some gardeners say that melon seed are better for keeping several years, as it is said they produce a less vigorous vine but better flavored fruit.

Iowa.—The round, whitish balls found when plowing, and of which you send specimens, are a species of mushroom, or as generally termed, Puff-balls. The particular species cannot be determined from undeveloped or half-grown specimens, and those dried hard, as in the case of those sent us.

Buckingham.—The handsome grass with arrow-head-shaped spikes is commonly called Meadow Grass, but its botanical name is *Eragrostis poæoides*. It is not considered to possess any agricultural value, but is found in waste places and sometimes in cultivated grounds.

Florida.—The brilliant greenish beetle with bronze colored thorax, and a long slender recurved horn springing from the top of the head, extending backward, nearly or quite a half inch is the male of *Phaneus carnifex* a very common scavenger beetle. It is found more or less common from New Jersey to Florida. There are a number of species of the *Phaneus* inhabiting the United States, but the one named above is the only one of the number found in the more Northern States. A dark brown species *P. triangularis* is very common throughout Texas. They are considered beneficial, as their food consists mainly of the excrement of the larger animals.

J. C. Allen, Vernon, Vermont.—Inclosed I send you flower and leaves of a plant growing in my garden, which is here called Comfrey. Is it the common Comfrey described in the RURAL of Sept. 9. ANS.—It is.

A. C. Pope, Binghampton, N. Y., Sept. 16.—My nephew brought me a plant, to-day, in full bloom which puzzled me to give a name. It belongs to the same class as the weed commonly called "Cheeses" from the seed vessel which resembles a very small Cottage or Dutch Cheese. The flower however, is very large measuring full 1¾ inches; five petaled heart-shaped veined with a darker shade than the body color which is a pale redish purple and is when on the plant a very showy flower. A name would be desirable through the answer to correspondents. ANS.—It is perhaps *Malva sylvestris*—It is certainly a Malva—but we cannot determine the species positively without a flower and leaf. You send a flower but it is pasted upon the paper and the only thing that we can ascertain by it is that it has five petals.

"Subscriber" wishes to know of a remedy for catarrh. Several of our acquaintances have been benefited by the use of water forced up one nostril and through the other in a constant stream for five minutes at a time or as long as it can be borne. A quart bottle is filled with water either fresh or salt as preferred. One end of a rubber tube is connected with it, the other applied to the nostril. The bottle is then held or placed above the head higher or lower as we desire the current more or less strong. This is recommended by many eminent physicians. The apparatus is sold at a small price by most druggists.

Catarrh is an inflammation of the mucous membrane and is called coryza, laryngitis or bronchitis as the nose, larynx or bronchial tubes are affected. Coryza is, we believe, incurable except by a permanent or long-continued change of air; and we also believe that the snuffs and most other catarrh medicines in vogue are positively harmful. "Subscriber" also wishes to know if we can give any information about employment for women, teaching and sewing being injurious to her health. Having no acquaintance with our correspondent, we do not think of any employment which would not in all probability have occurred to her.

Invalid asks our opinion as to the healthfulness of various kinds of food. She disagrees with Mr. PECK in his qualified advocacy of pork as a healthful food and advocates "an exclusively vegetable diet."

Dry Goods, &c.

LUPTON & CO., Publishers, 37 Park Row, N.Y.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oskosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Wit and Humor.

TOM COOKE, THE ACTOR.

At a trial in the Court of King's Bench in 1813, between certain music publishers, as to an alleged piracy of an arrangement of the song of "The Old English Gentleman," Cooke was subpœnaed as a witness by one of the parties.

On his cross-examination by Sir James Scarlett for the opposite side, that learned counsel questioned him thus—

"Now, sir, you say that the two melodies are the same, but different; now, what do you mean by that, sir?"

To this Tom promptly answered—

"I said that the notes in the two copies were alike, but with different accent, the one being in common time, the other six-eighth time; and consequently the position of the accented notes was different."

"Now, pray, sir, don't beat about the bush, but explain to the jury, who are supposed to know nothing about music, the meaning of what you call accent."

Cooke: "Accent in music is a certain stress laid upon a particular note, in the same manner as you would lay a stress upon any given word, for the purpose of being better understood. Thus, if I were to say, 'You are an *ass*,' it rests on ass; but if I were to say, '*You* are an ass,' it rests on *you*, Sir James."

Shouts of laughter by the whole court followed this repartee. Silence at length having been obtained, the judge, with much seeming gravity, accosted the counsel thus—

"Are you satisfied, Sir James?"

Sir James (who had become scarlet in more than name), in a great huff, said—

"The witness may go down."

SPARKS AND SPLINTERS.

Irish drill-sergeant (to squad of militiamen)—Pr's'nt 'Rms!—(Astonishing result.)—"Hiv'ns! what a prisint! Just stip out here now, an' look at yersilves!!"

"How much will your new school books cost, Johnny?" says father. Johnny calculates to himself, soto voce, "Lemme see: 62 cents for the singing book, 75 cents for a new 'rithmatic, $1.25 for a new 'jography, 25 cents for a hockey, harf a dollar for a new hat, and a quarter for candy." Then out loud says: "'Bout four dollars, pa!"

Two persons were once disputing so loudly on the subject of religion that they awoke a big dog which had been sleeping on the hearth before them, and he forthwith barked most furiously. An old divine present, who had been quietly sipping his tea while the disputants were talking, gave the dog a kick, and exclaimed, "Hold your tongue, you silly brute! You know no more about it than they do."

"Well, uncle, how is the cause of religion getting on in your neighborhood?" "Mighty poor—mighty poor." "No new converts, eh?" "Not a single one—not de sign of one." "What seems to be the matter?" asked the citizen, after a lengthy pause. "De matter is dat some one hez stolen four big watermelons out o' my cart dis afternoon, an' I feel in my bones dat religion is gwine down hill all froo dis locality!"

A TERRIBLE THREAT.

Bridget—"Sure, if yees dont git out of this and sthop yer botherin', I'll be afther makin' a clowthes pin of yees.

"ABOUT PHEASANTS."

CAN you tell us anything about what are in Europe called Pheasants, especially the breed termed Bohemian Pheasants? Can these breeds be crossed or hybridized with other breeds or species of fowls? By answering the above you will much oblige—W. STOCKMAN, *Huron Co., Mich.*

The term Pheasant is applied to various species of birds, some closely allied and others somewhat distantly related. The term Pheasant belongs to the restricted genus *Phasianus*, and the birds are remarkable for the facility with which they interbreed and the circumstance that the cross-bred progeny are perfectly fertile.

To more clearly show the appearance of some of these birds, we reproduce an illustration (which we had engraved for the RURAL in 1870) of Bohemian and Hybrid Reeves Pheasants varieties which have attracted considerable attention in Europe. Of the two figures represented in our engraving, one, the Bohemian, would on all hands be regarded as a mere variety which, like all variations, may at any time recur without any known or apparent cause. It was undoubtedly derived from the common species, which it resembles in all respects except color. The feathers of the sides and lower part of the neck have a deep margin of a blackish blue; those on the back of the neck a narrow, dark edge, with a central spot of black. The markings on the back and other parts are the same as the common Pheasant. The size of the Bohemian Pheasant varies considerably, but the extreme length from bill to tail of an ordinarily good specimen is about 35 inches, of which the tail is about 20. The length of the female is about 10 inches less than the male.

The upper figure in our illustration represents a hybrid between the Reeves or Barred-tail Pheasant and a Bohemian hen. In size the bird is larger than the common species, but the markings are somewhat different. In coloration the beauty of the Reeves is almost lost; the general tint of the body is a bright, rich chestnut.

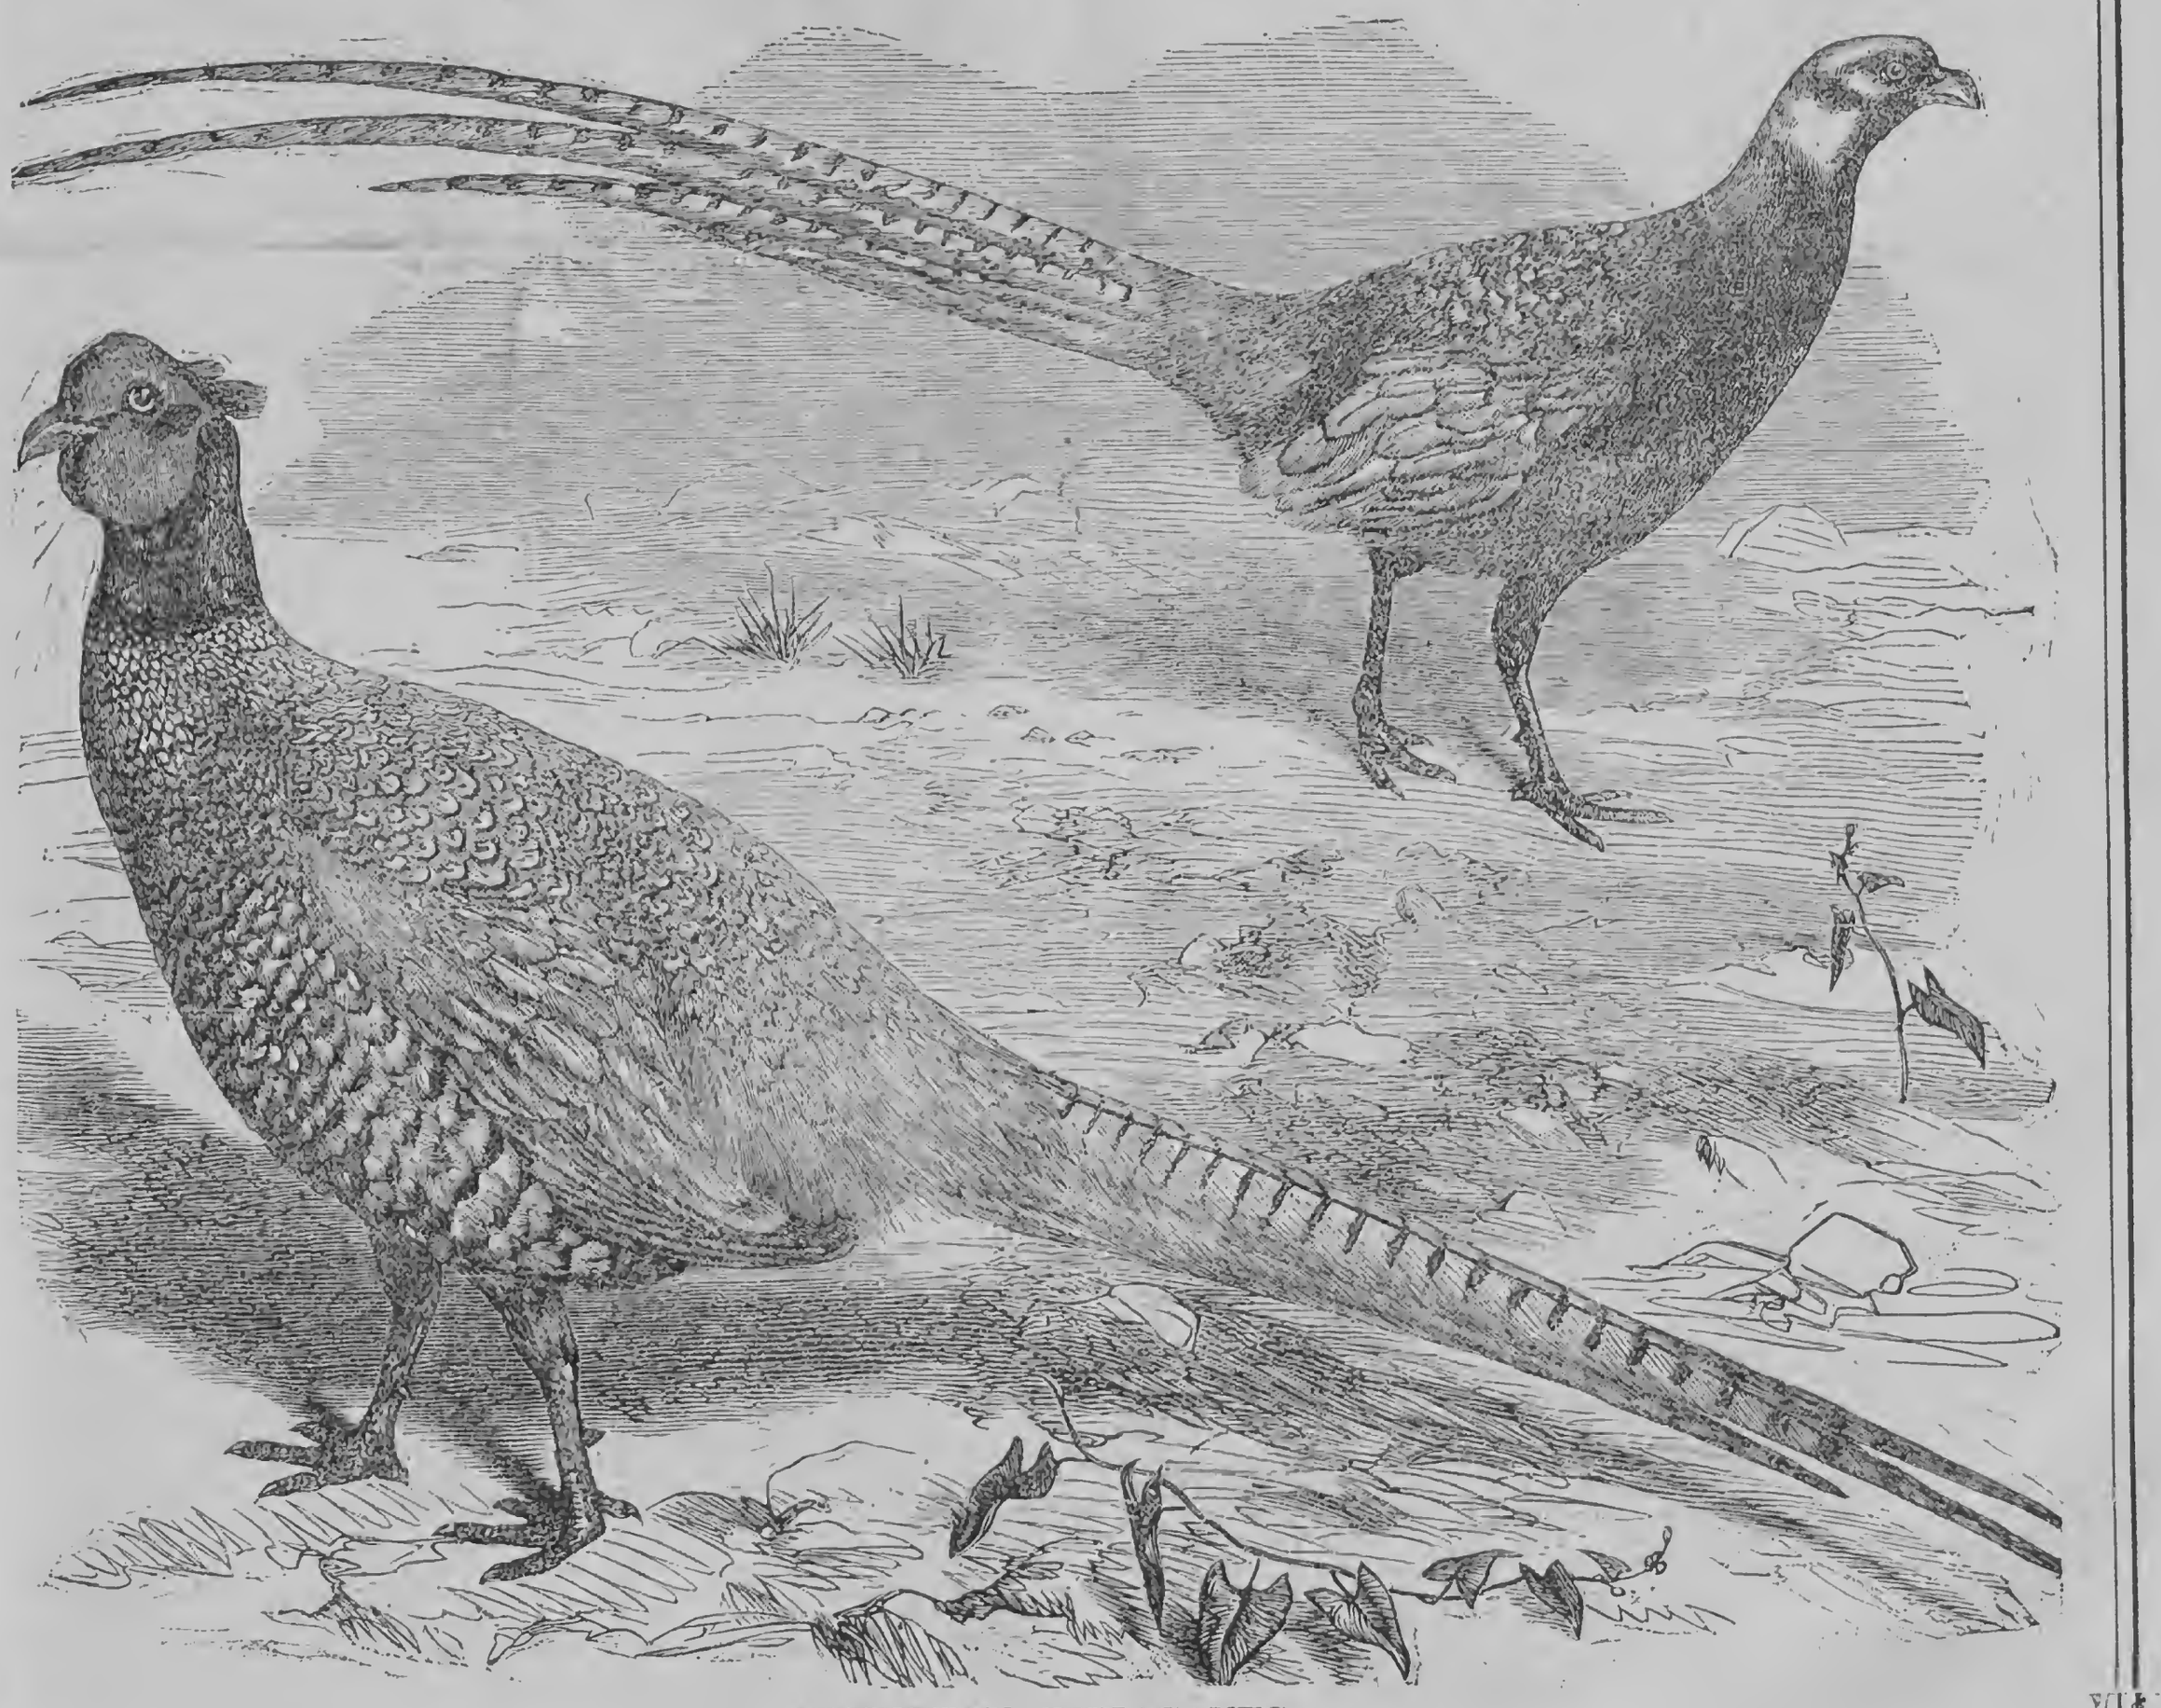
We think it might be a profitable operation for our poultry fanciers to import some of these Pheasants and let them loose upon the high table lands of North Carolina and Virginia, where they would probably multiply rapidly and in a few years become abundant. Such things have been done in Europe and might be done here; and there is certainly room for an enterprising man to experiment in this direction to almost any extent, but we cannot give him much encouragement to expect great profits.

POULTRY IN LARGE FLOCKS.

IN answer to "Questions about Poultry," page 199, I would say:

It has been proved over and over again that poultry do not succeed when kept in large numbers in confined space, and in every instance published to the contrary it has upon investigation turned out to be misstated, and in one or two noted cases the statements were complete fabrications, without the slightest foundation in truth.

I have had experience on an extensive scale for 50 years. From 1825 to 1835 my mother kept fowls at three homesteads in England—the Rectory farm, the old barns and yard in the village of Bourton, and at the Dunstale farm. Her profits from the three flocks were on an average about £30 ($150) each. I was her right-hand man all through my boyhood. During this pe-



BOHEMIAN PHEASANTS.

riod of time I was often at Sezincota, the beautiful seat erected by Sir CHAS. COCKERELL and now in possession of his grandson, Sir C. RUSHOUSE. While I was there the gamekeepers gave me such correct ideas of the feathered tribe that I never fail in any undertaking, every establishment of poultry invariably prospering when I have entire control, and my son has at the present time the same good results, as far as he proceeds according to the experiences of the past.

But to return to the gamekeepers. They raised vast quantities of Pheasants, Partridges and Wild Ducks from the eggs which were found where the nests were disturbed among mowing grass and other places where the old birds could not hatch out. There were a great many hundreds raised every year, but fresh, untainted ground was resorted to, and the coops and the whole area of three or four acres within iron hurdles, was moved as fast as the droppings showed it was advisable, consequently in raising poultry in after years fresh ground was always obtained for young chickens and range had for old ones. A few years since myself and family offered, by advertisement, to raise ten thousand on shares, but not one out of many correspondents could be made to see the necessity of spreading the fowls over so much space, almost all of them expecting to have hundreds together crowded much thicker than women and children in tenement houses in cities. At this time I have enough in family to raise thousands very easily, and this is the only time of the year to begin; but although the cheapest possible roosts only would be required, which we could erect ourselves, not a soul could be found who would find room or see the necessity of placing them all in small families, although by doing so it is evident the poultry would get half their living by ranging and never know disease. One of my boys was last spring urged by a gentleman to raise as many as he could from a few old hens. He has already overrun the place and frightened the gentleman, because as they grow their appetites grow also.

If fowls have unrestrained range and liberty they will not be unhealthy, even though the droppings under the perches in the roost be allowed to remain week after week, but it is a good plan to clean out often and throw ashes or dry earth for the dung to fall on, as the whole can then be swept up together and kept for use on the land, where it will serve instead of phosphates, guano, etc.

Disease will not appear among any poultry where the young have fresh, untainted ground to live on and where the old birds have free range and are not in families of more than 20 or 30. Put 1,000 old hens in families of about 30, having two roosters with each family, and give to each roost a space between it and the next which will average 5 acres to each, and less than 200 acres will be required; then have the roosts so constructed that they can be removed easily and cultivate the land with an eye to the welfare of the fowls and wonderfully profitable results will follow; then as each hen hatches move her to other quarters away from all other old fowl, and no ailment will ever interfere with perfect prosperity. With a suitable tract of land 10,000 can be raised, allowing 2,000 or 3,000 for hawks, weasels, etc., though, excepting in the vicinity of woods, there need be very little loss.

Poultry kept in this way will never eat eggs or touch feathers, except to cleanse themselves; in fact, all miseries and failures with poultry occur through unnatural treatment, for I have proved it for 50 years and can laugh all remedies to scorn. Prevention is easy, then why want cures?

Let demented creatures write about diseases and cures for them, and let them dispute about lice and gapes, exposing folly of the weakest character, but let sensible people who wish to raise any kind of the feathered creation in large numbers, do so by avoiding every approach toward following the directions of those who write and talk as if anything was required for the welfare of fowls besides food and water and suitable roosts.

Admitting that good managers of poultry will meet with misfortunes, they need not be of sufficient weight to seriously affect the profits, because when the poultry establishment is of such magnitude as to have thousands there would always be some one on the watch by night as well as by day.

I have no desire to ridicule others, but it is most extraordinary that there should be such very great ignorance and mistakes about poultry. If any gentleman or lady wishes to raise thousands of poultry or rabbits, either for pleasure or profit, I would willingly join in and pledge myself to carry out the undertaking in a most successful manner. A WORKING FARMER.

GAPES.

THE following account of the symptoms and treatment of this disease, the most fatal, perhaps, of any to which chickens and hens are subject, is well given by the Canada Farmer:

SYMPTOMS.

The disease commonly known as "the gapes" is caused solely by the presence of numbers of worms in the windpipe, which thus becomes so filled up as to render respiration difficult, and if in considerable numbers, by their growth the obstruction is complete, and death results from suffocation. Young chickens thus attacked seldom recover without special treatment for the removal of the worms. Chickens only three or four days old often show symptoms of the disease by opening wide their mouths, gasping for breath and attempting to swallow. They also frequently sneeze. As the disease grows worse these symptoms become more marked; the chickens continually gasp and struggle for breath, grow weak and dispirited, and finally droop and die. In fatal cases, one or two dozen of these worms are often found in the windpipe, completely filling it up.

REMEDIES.

The worms may be removed by a feather from which the web has been stripped, except a small portion near the tip. This may be moistened with oil, salt water, or a weak solution of carbolic acid and introduced into the windpipe, when, if it be twisted round once or twice and removed, it will usually bring away several of the worms. This operation should be repeated at intervals until all the worms are destroyed. All worms removed in this or any other way should be carefully destroyed, preferably by fire, for the embryos are extremely tenacious of life, and if left upon the ground are likely to spread the disease. For the same reason birds that are infected should be separated from healthy ones, and poultry should never be allowed to run in the same yards or grounds or be kept in the same houses where infected ones have previously been kept, unless the premises have first been thoroughly sprinkled with a strong solution of carbolic acid or petroleum water, to destroy the old worms or the eggs and embryos that may have been discharged from the sick ones. The vessels from which they feed should be frequently and thoroughly cleansed, and they should be supplied with pure water, frequently renewed.

In extreme cases the worms may be safely removed by a surgical operation; but this requires skill. This is done by first carefully securing the bird, or still better, by administering a few drops of chloroform, placed upon cotton and held to the nostrils. The skin of the neck is then to be divided with a very sharp knife and the windpipe opened by a longitudinal slit about a quarter of an inch long. The worms may then be removed by a pair of small forceps or other suitable instrument. The incision of the skin may be closed by one or two stitches, and the wound will generally heal in a few days. By this operation an almost instantaneous cure may be effected, even when the disease has progressed nearly to the point of suffocation; but in unskillful hands it is not likely to be so successful as the other remedies already described.

Farm Economy.

THE TUBE WELL AND ITS USES.

IN a late article on the Tube well it was incidentally shown, that, while the reservoir of a dug well is circumscribed by its walls, that of a tube well is coextensive with the tributary water-bearing strata. Wherever a demand, therefore, exists for a constant, uniform and abundant stream, the modern well has a decisive advantage over its venerable congener. As a rule this demand can be illimitably supplied, either by sinking a single tube of sufficiently large calibre, or, preferably, by driving down a number of adjacent tubes and concentrating their discharges in a single exhaust pipe by means of ordinary elbow couplings. The difficulty of driving is thus vastly lessened, as well as the risk of injury to the tube and its couplings, while the slight increase of fluid friction is offset by the freer inrush of water from the broader area drained by the cluster of isolated tubes. Factories, railroads and stock farms are the chief beneficiaries of this adaptation, and not a few Western towns also, still too new or unenterprising for water works employ it for fire-extinguishing purposes.

Nor is the tube well's claim to superiority a whit less bold for the quality than for the quantity of its waters. A dug well is often a receptacle for refuse and vermin, and always for surface drainage with its attendant impregnations of decaying animal and vegetable matter. Fertile, alluvial lands, and newly-settled districts are especially exposed to insidious diseases incident to these noxious impurities. The water from a tube well, on the contrary, purified by filtration from a distant source, and imperviously guarded from local latteral percolations, is as pure, cold and sparkling as that still flowing in the aqueous strata. In view of the paramount importance of health to the farmer and colonist, and of the dominant influence the water he daily uses must constantly have on this, any device for insuring its purity cannot well be over-estimated.

Cheapness in cost, especially in districts where materials for the walls of a well are scarce, is another point no less in favor of these wells than the rapidity and absolute safety of their construction. The ruin that sometimes befalls a dug well, whose walls have been undermined by the washing away of their sandy support, is impossible to its rival, the foundation of which is paradoxically in the pump-stock above the surface. To a mother's heart it will always be a recommendation that the most capacious of these tube-girt holes cannot well prove a pitfall even to the most diminutive of her adventurous brood. The doggerel riddle anent the immovability of wells, which mythologists declare to be of immemorial descent, is hardly applicable to this modern form, one of whose claims to special merit rests on the ease with which it can be taken up and removed, as necessity or convenience may dictate. Stockmen, emigrants and other nomads are likely to find this feature as serviceable as the British army did in the Abyssinian war, and still later in the invasion of Dahomey.

Although it is seldom that any consideration is allowed greater weight than the accessability of water in determining the site equally of a country hovel or farm-house, yet the conditions of a dug well generally necessitate its location at some distance from the drainage and movements immediately around the house. The ungrateful task of drawing and transporting water, even in the most inclement weather, commonly falls to females, warm from household work, many of whose tedious ailments are caused or aggravated by the sudden exposure and strain of this drudgery. A tube well in the kitchen, while inaccessible to frost, and unproductive of unhealthy dampness, will, without the risk of exposure to rain or blast, plodding through mud and snow, splashing passages, floors, or clothing, and, not least, without a temptation to an uncleanly economy of water, yield at all times an abundant stream and prevent many wearisome complaints, domestic as well as physical.

In some districts the only possibility of well-water is from the heart of a quicksand. Here a dug well is wholly impracticable, and despite the vaunts of well-drivers, the success of a tube well is seldom entirely complete or permanent. To prevent the influx of sand from choking up the suction pipe is the difficult problem which many patents claim to have solved, a claim which has here a trifle more truth than patent pretentious generally possess. A fair measure of success has in reality been achieved, and to have rendered the impossible practicable is not entirely without merit.

In searching for water by this process of well-making, a rocky formation presents an impenetrable barrier, and a chance boulder encountered by the descending drill, necessitates its withdrawal and a change of site for the well. No special preparation is needed to penetrate thin layers of clay, but to avoid serious injury to the tube and its couplings the tenacious depth of a thick bed must be pierced either by an earth auger, a pioneer "drive rod" or by forcing down a tube, wholly or partially open at the bottom and withdrawing it at intervals to lessen the resistant friction by the extraction of its adhesive contents.

As the hight to which atmospheric pressure can force a column of water into the vacuum created in the suction-pipe of a pump is limited, under the most favorable circumstances, to about 30 feet, it is absolutely essential that this should be the greatest interval between the cylinder of the pump and the water. In many wells driven to a much greater depth, hydrostatic pressure lifts the water to a hight from which atmospheric pressure can readily force it to the surface. Whenever the water in a well, however, rests more than thirty feet below the brink, the pump cylinder must be lowered to within this distance into a pit sunk for its reception.

In constructing a tube well the services of a skilled well-driver should be obtained wherever convenient, elsewhere a handy novice can, at the cost of a little forethought, care and ingenuity, readily supply his place, while dispensing with his special appliances. Points and filter-sections are purchasable with the necessary tubing, and the skill that could sapiently locate a dug, can also wisely determine the best site for a tube well. KEMP.

SPARE AND PROTECT THE TOADS.

THE Practical Farmer has the following to say about the usefulness of toads, which we commend to the attention of our readers and especially to the Rev. J. W. SHEARER, who, in a late communication to the Bee Keeper's Magazine, urges the destruction of these useful animals:

Many boys seem to have a wonderful itching to knock over every toad with a stone or club, and when they happen to go within a few rods of a bird, they look around, almost instinctively, for a stone to kill the dear little songster. This is exceedingly wrong, as toads and birds are the farmer's best and most useful friends and helpers. It is said that there is actually a considerable commerce in toads between France and England. A toad of good size and in fair condition will fetch a shilling (twenty-five cents) in the London market, and a dozen of the extra quality are worth £1 sterling ($5). A writer in a European paper states that one may see these imported toads in all the market gardens where the soil is moist, and the owners of these gardens even prepare shelter for them. Many grave persons have shaken their heads when they heard of this new whim of the English; but those laugh the best who laugh the last. This time the English are in the right.

The toad is very helpful to the husbandman as a destroyer of injurious insects on which it chiefly feeds. Toads have a curious, net-like lasso, which they throw out so quickly to trap insects, that a fly is not sufficiently agile to escape. Boys, spare the harmless and useful toads, and the dear little birds that subsist on insects which destroy our fruit and grain. The President of the Farmers' Club of the American Institute, N. C. Ely, who owns a farm worth $60,000, in Connecticut, once stated to the Club, that he was accustomed to pay fifty cents each for toads which were put on his farm to destroy insects. We place small pieces of boards over little depressions in the garden and about the yard, as refuges for useful toads.

Field Crops.

A NEW INDUSTRY IN CALIFORNIA.

A SAN FRANCISCO correspondent of the Baltimore Sun says:—A new industry unknown to the press is in process of inauguration in California, which may interest the rural districts of Maryland and elsewhere. It is making sugar, table sirup and table oil from watermelons. Mr. Roo of San Francisco, seeing that our beet sugaries have not made profit, turned attention to watermelons. He found that when beet sugar proved unprofitable in Hungary, Herr Hoffman substituted melons, with most gratifying success. His sugary at Zombar, is one of the largest and best paying in Europe. Accordingly Dr. Hiller was sent to Hungary to consult with Herr Hoffman, compare climates, and if satisfied, he was instructed to buy works and import skilled labor. To make double assurance he bought a large sugar factory in full and successful operation, and engaged its best men to come to California and go on just where they left off. In this way, supposing the melons to be all right, there can be no failure. The machinery has arrived at New York, and workmen are now planting the home-made engine and boilers. The locality is on Andros Island, in the long Delta 'twixt the rivers Sacramento and San Joaquin—pronounced Sanwaukin. This belongs to a group of low islands that are submerged at high water, and therefore not fit for culture. But when reclaimed by embankments they are exceptionally productive in all seasons, wet or dry.

But while beets are not always sure, melons are a crop that never fails in this climate, and the factory being on navigable waters, it can get melon juice from a vast area of melon country at small expense for transport. Andros Island itself is famous for melons, and so are Grand and Bramon Islands, near by, and now reclaimed. The distance from San Francisco is about 70 miles by water. Watermelons with white pulp are preferred. Their agriculture is more than 60 per cent. less costly than beets. They are planted twelve feet apart one way, and the other way six feet apart. Before weeds interfere the leaves of the plants cover the ground and kill them. Besides, they make an impenetrable mulching, which keeps the soil moist and prevents baking. Harvesting melons is cheap and cleanly, while uprooting beets is laborious, and the coarse, adhering dirt is removed by hand while the crown is cut away as unprofitable for sugar. Beets also need much weeding.

A melon field needs only one-fourth the plowing. Beets can only be delivered in the root, because the juice turns quickly black and the sugar becomes starch, while melon juice is not affected for several days. Beets are washed and rasped or sliced, while melons, by one cut, deliver their juice over a seed strainer into the vats direct. The melon being free from impurities, which make costly chemistry in beet sugar, is much less expensive.

Beet sirup is only fit for distillation. The sirup from melons is delicious. The seeds make the finest table oil, and the refuse is good for cattle. Taking account of so many advantages, sugar from melons, though rated at 7 per cent. of the weight of the fruit, instead of 8 allowed for beets, costs less to make. The difference may be set down as 5¼ cents for melon sugar to 7 cents a pound for beet sugar. In regard to quality beet sugar is superior. Unless extra

care be used beet sugar is apt to have an unpleasant buggy flavor.

Let it be understood that beets can only succeed in moist bottom lands. Melons strike deep root and they grow everywhere on our uplands. No doubt they would thrive luxuriantly in Jersey, Delaware and Maryland. In the sandy soil States south no crop can be more certain, and Baltimore would make a convenient center for supplies of melon sugar works. San Francisco sympathises with Baltimore and means to trade with her. Cheerfully we offer our experiences in everything we think will help her prosperity, and we mean to keep her advised of our success in melon sugar-making, believing it will serve her interest.

Dairy Husbandry.

TURNING DAIRY STOCK IN FALL.

The recent plan of transporting fresh beef from this country to England in ships fitted up with refrigerators is pronounced a success, and is likely to have an important influence on the meat trade of this country. England for a long time has not produced a sufficient supply of meat for her own consumption, and immense numbers of cattle are annually imported into the kingdom for slaughter. The cattle come from various parts of the Continent of Europe, and a visit to the great cattle market at Islington, London, is interesting, not only for the large number of animals exposed there for sale, but for the great variety of breeds coming from the different countries on the Continent. Meats are very expensive in England, and the plan of exporting the carcass in refrigerators, so that it arrives in England fresh and without change, is said to afford a considerable profit to the shippers. The American Grocer, in alluding to the refrigerators in use on the ocean steamers, says:

"Those now in use are built just opposite the main hatchway in what is called the steerage or orlop deck. The ice-box is an air-tight compartment about 70 feet long, 12 feet wide, and in hight from deck to deck. The floor is covered with zinc, and the iron side of the steamer boarded over so as to form a compartment. The wood-work is covered with thick material to insure the box being air-tight. In the center of the floor is a trough to carry off the waste water from the melting ice. In filling the box with ice, large quantities of rock-salt are packed with it. In one corner is a revolving fan which forces the cold air into the meat-box at the top and draws it back at the bottom. This meat box is about 25 feet by 35 feet, and is lined with hooks, on which the beef carcasses are hung. About 200 carcasses are sent every week, and so successful has the venture proved that the quantity sent is only limited by the want of freight room."

So far ten European steamers have been fitted up with this new refrigerator, and it is said the English market will take all the meat that obtainable freight-room will permit being sent. There can be no doubt that this trade will be largely increased, and with a constant increase in the home demand, beef is likely to bear a price that will well pay our farmers for producing it. In view, then, of the comparative scarcity of and increased demand for fat cattle, the question occurs, whether it will not pay dairymen in putting stock to be turned in good order, instead of selling it at the ruinously low rate that is customary. The plan now followed by dairymen, and which has been in operation for many years, is to sell off in fall all animals that do not prove profitable for milk. No attention is paid to putting these animals in condition for the shambles. The price paid for this kind of stock is usually very low, ranging from $8 to $15 per head for animals in ordinary flesh, and $20 to $25 for large-sized cows fit for the butcher. Good-sized younggerly animals, thin in flesh, are put off at the lowest rates named. Some of the animals are well along in years, and the whole lot for sale is often "lumped off" to the buyers dealing in this kind of stock at buyers' prices. In years past the poorer specimens of this kind of stock have been slaughtered merely for the rounds, and the hides and the remaining part of the carcass thrown away. Many an animal that in spring cost the dairyman from $50 to $60, and which, proving unprofitable for milk, has been sold in the fall at from $8 or $10, or for such rates as could be obtained. Now, the cause of these low prices comes from the poor condition of the stock; it is not fit for marketable beef, the farmer thinks it will not pay to winter it, and therefore disposes of it, making a heavy loss between purchase and sale.

The general practice as above described we believe to be all wrong and that better results would be obtained by putting at least a portion of the animals in flesh and fitting them for the shambles. It seems a great waste to kill an animal poor in flesh. If dairymen would more generally engage in growing roots, turnips and mangolds, the animals could be fattened without any great outlay for meal and a considerable profit would be obtained from this branch of the business instead of the loss which is now made. Much of this stock is yielding little or no milk by October, and if they were at once dried off and fed a little meal, with pumpkins, turnips and other available food from the farm, the animals would be in good order by December and could be sold at satisfactory prices. This would be especially the case with young, thrifty stock which have not proved profitable for milk. There are many accidents that occur in the dairy, such as defective udders, the loss of teats, the failing to come in calf, which render it desirable to turn animals that are young and thrifty and which would take on flesh rapidly with a little extra feeding. It is poor economy to sell such stock in the fall when it is out of condition, because it will not bring anything like its real value. English dairymen always make a point of fattening all stock to be turned, and they thus realize a profit from their animals. We believe the same system can be carried out here, and with the prospect of an increased demand for good beef, dairymen will do well to give the matter attention.

The Pall Mall Gazette, in a recent article referring to the importation of American meats and cattle to Scotland, says:

"Last week 154 cattle were sold in Glasgow and brought on an average £33 ($150) each. Never, it is stated, did a lot reach so much on an average. Dead meat is also imported in large quantities. The first sale was held on the 5th of June, when 100 carcasses of beef and 72 of mutton were disposed of. Since then about 150 carcasses on the average have been sold weekly. Last week 210 carcasses were sold, and on Wednesday evening there might have been seen passing through the streets of Glascow to the cattle market the uncommon procession of 33 lorries, each laden with three tons of butchers' meat. The freight paid for carriage to Glascow, Liverpool and London last week amounted to £1,900 ($9,500). Altogether, since the importation began, 1,250,000 pounds of dead meat have been sold in Glasgow. About 1,000 cattle were last week exposed in Glasgow market, and of these 365, dead and alive, were imported from America. Cattle killed on Thursday in New York are sold that day fortnight in Glasgow. In the course of a month or so the importation of live cattle will cease for the winter, but arrangements are being made for increasing the *dead meat* supply, and it is expected to be not less, all the winter, than 200 carcasses a week."

In view of these facts and the prospects of shipping meats largely in the future, we think dairymen will find it to their advantage to make the most of such animals as are not wanted in the dairy, and instead of turning them off for "a mere song," they should be put in condition and sold for a good price. Dairymen have the means at hand for doing this successfully. It only requires a change of a practice which has always resulted in loss, and which has been deplored because no other course seemed feasible.

FOOT ROT IN THE DAIRY.

A correspondent writes us as to the best manner of treating Foot Rot in cows. The treatment adopted successfully by Herkimer County dairymen is to apply an ointment made of lard and red precipitate (oxyd of mercury) to the affected parts and rubbing it in. The ointment is made much stronger than that usually sold at the shops, which is composed of one part red precipitate to eight parts lard. For the purpose named it should be composed of one part of the precipitate to four of lard. It is cheaper and better to purchase the precipitate and make the ointment at home. Take a quarter of a pound of lard, melt it, and then let it cool off until it begins to thicken or is not in a fluid state; then stir in one ounce of red precipitate. In bad cases, where the disease is in the heel and upon the leg, the ointment should be applied and worked in by holding a hot iron near the affected parts. The foot, of course, should be cleaned previous to the application by washing well with soap and soft water. When the disease is between the claws and the animal is fractious, the ointment may be rubbed in by drawing a rope through the parts. One application, if thorough, will generally effect a cure; but if all the parts are not reached by one application, apply again in 48 hours.

We have successfully treated foot rot, when between the claws, by cleaning the parts of dirt and washing thoroughly, then while the parts are wet applying corrosive sublimate in the center of the foot between the claws. The corrosive sublimate is reduced to a powder and a quantity that can be raised on the point of a pen-knife taken. This will be sufficient for one application. The dampness of the parts causes the powder to adhere, which soon produces suppuration.

Foot rot should be treated in the early stages of the disease, as the animal often is in great pain, and when neglected, not unfrequently becomes useless for milk during the remainder of the season. One cause of foot rot, it has been supposed, is from allowing animals to tramp in wet, muddy places; but this is not always the case, as we have known it to occur in herds where the pastures were dry and the animals never allowed to go into muddy places. It sometimes is very bad, running through the whole herd, and prompt measures should be taken in treating the disease in its earliest stages.

VERMONT DAIRYMEN'S ASSOCIATION.

The annual meeting of the Vermont State Dairymen's Association will be held at the Capitol, Montpelier, on the 25th of October. X. A. Willard of the Rural New-Yorker has been engaged to give the annual address.

The meetings of the Vermont Dairymen's Association have been very largely attended, and the annual session at Montpelier will be of great interest.

The Naturalist.

A WORD FOR THE SNAKES.

Permit me to say a few words in behalf of these much abused animals. Not that some of them do not merit their abuse, but that there are those which do not and the whole class should not suffer for the bad qualities of a part.

The whole class does, however, suffer from this cause, and it is almost impossible to find a single species of serpent to which some one will not impute venomous qualities. At the same time it is an established fact that in every country, Australia excepted, nonvenomous serpents exceed the venomous in numbers. Moreover, in all tropical countries the venomous snakes constitute a greater proportion of the entire number than they do in temperate regions, and in our favored land, especially in the northern states, such as New York, the proportion of venomous snakes is very small. In the above mentioned state fifteen species of snakes are known: only two of these, the Copper-head and Rattle-snake, are venomous and their bites rarely prove fatal if proper remedies are immediately applied. This, however, is often impossible and, as prevention is better than cure, the best plan to adopt is to learn to distinguish these species from all others. This plan I believe to be far better than the one now in vogue, especially among ladies, I mean the custom of running away with screams of terror at the sight of every snake, lizard, crooked stick or other innocent object which a fiction-trained imagination can convert into the semblance of a serpent.

Another undeserved charge is made against these creatures. It is that of viciousness. Here again a quality characteristic of the minority is ascribed to the whole class. Comparatively few of the non-venomous snakes are vicious and many of the venomous snakes do not possess this quality: thus, our northern Rattle-snake is not at all vicious, rarely biting unless it has received some real or fancied injury, and even then it rarely fails to give warning by sounding its ominous rattle. In Australia there is a snake which, though venomous, may be taken up and handled with impunity, as it is so gentle by nature that the idea of biting never seems to enter its head

It is stated that snakes do a great deal of harm by destroying toads, frogs, birds, and other useful animals. This, I regret to say, cannot be denied; but that is no excuse for overlooking the fact that a few of our snakes really do a great deal of good and little or no evil. Such are the Grass-snake and Ring-snake, that subsist upon worms, slugs, and insects; one or two others also, about whose habits little is known, are probably content with the same humble diet. Another, the Ribbon-snake, chooses a more varied bill of fare now dining on toad or frog, now condescending to put up with a dinner of large bugs or other insects. As to the larger serpents that live on birds, frogs, etc., even they partly atone for the damage done in killing these useful animals, by the destruction of field-mice, moles, chipmunks, and many other kinds of small, noxious rodents that infest our fields and gardens. However, only the first mentioned species; namely those living entirely upon insects, can be reckoned among the farmer's real friends, and consequently among those that deserve encouragement and protection.

Before I close I must say a few words for a family closely related to snake. I refer to lizards. Many are in total ignorance as to whether or not they are poisonous. For the benefit of such, let me say that there is not known to science a single lizard that is venomous, all are as harmless, and many as tractable as kittens.

Another point, concerning which some are equally ignorant, is the food of lizards. Many are unable to decide satisfactorily, when they meet with a lizard, whether it is their duty to kill it or to let it go. Lizards, on account of the structure of their jaws, cannot swallow large prey, but are better adapted to feed upon insects from which they, almost exclusively, derive their sustenance so that any one who kills a lizard, instead of benefiting agriculture, is really injuring it. By all means encourage the lizards.

F. W. C.

THE BIRTH OF THE FLY.

Sir John Lubbock, in a recent paper in Nature, London, describes the birth of a May-fly from a full grown larva, which, having observed it to be in a glistening condition, he caught and put under the microscope in a drop of water. Very few minutes had elapsed when he had the satisfaction of seeing the thorax open along the middle of the back; the two sides turned over; the insect literally walked out of itself, unfolded its wings, and in an instant flew up to the window. Several times since he has witnessed this wonderful metamorphosis, and it is extraordinary how rapidly it takes place. From the moment when the skin first cracks, not ten seconds are over before the insect has flown away. Like the ephemeræ, dragon-flies, at first dull, brown, sluggish and ugly larvæ, with six legs, are developed in water. Not so the ant-lion, which passes its early days in dry sand.

Sheep Husbandry.

SHEEP FOR ENRICHING LAND.

The National Live Stock Journal, in speaking of the value of sheep for enriching land, says:

"Some fifty years ago Anderson said, 'One thousand sheep folded on an acre of ground one day would manure it sufficiently to feed one thousand and one sheep; so that by this process land which the first year can feed only one thousand sheep, may the next year, as a result of their own droppings, feed thirteen hundred and sixty-five.'

"Sprengel allowed that the manure of fourteen hundred sheep for one day is equal to manuring highly one acre of land, which is about four sheep per year. Mechi, a still more recent authority, estimates that fifteen hundred sheep folded on an acre of land for twenty-four hours, or one hundred sheep for fifteen days, would manure the land sufficiently to carry it through four years' rotation. In the United States much less attention has been paid to this item of profit to be derived from flocks. Only upon the poorer land, and then only from the exceptionally few close-observing and calculating men do we meet with any notice of it at all. Not so in England and France, where the necessities imposed on the density of population and consequent enhanced value of the land compel recognition of every minutia of profit by the cultivator of the soil. There feeding and grazing of sheep enters into a system of rotation with invariable regularity. Without the sheep of England to-day her agriculture would be a failure. Their value to English agriculture is to be found in their manure. Though not of themselves profitable, they make it possible for other branches of agricultural industry to become so.

"Prof. Coleman of the Agricultural College at Cirencester once said, 'It is not difficult to show that sheep alone, apart from their influence on the corn crops, will not pay a living profit after all the expenses of growing the crops are considered.'

"M. Thiers says, 'The agricultural industry of France cannot dispense with sheep.'

"Science has lately made the gum washing from fleeces at the factories contribute to the fertilization of soils. Mr. Hayes tells us that the French chemists, MM. Maumene and Rogelet, have established very recently at the great seats of the woolen manufacture in France, as at Rheims and Elbeuf, factories for putting the new industry which they have created into practical operation. They induce the woolen manufacturers to preserve and sell to them the solutions of yolk obtained by the washing of the raw fleeces in cold water, and pay such a price as encourages the manufacturers to wash their wool methodically, so as to enrich the same water with the yolk of a number of fleeces. These scourings the chemists carry to their factory and there boil them down to a dry, carbonaceous residuum. The alkaline salts remain in the charred residuum, and are extracted by lixiviation with water. The most important of the alkalies obtained is potash, which is recovered in a state of great purity. It is computed that if the fleeces of all the sheep of France, estimated at 49,000,000, were subjected to the new treatment, France would derive from this source alone all the potash she requires in the arts—enough to make about 12,000 tons of commercial carbonate potash, convertible into 17,500 tons of saltpeter, which would charge 1,870,000 cartridges."

The Centennial.

COLLAPSE OF THE CENTENNIAL DAIRY RING.

CENTENNIAL EXHIBITION,
PHILADELPHIA, Pa., Oct. 4, 1876.

YOUR contemporaries of the agricultural press seem to have visited considerable censure upon the RURAL for its position in the matter of the Committee having in charge the Dairy interests here, but, after a thorough investigation of the whole affair during the last week, I cannot see anything other than justification for what you have said. It became necessary to resort to some of the means known only to newspaper correspondents to get the desired information, as the heads of the departments and officials generally are, and always have been, quite reticent about this disgraceful branch of the great Exhibition. Therefore, my facts had to be collected piecemeal.

It seems that the Legislature of the State of New York appropriated the sum of $8,000 to help defray the expenses of the Dairy Exhibition here, and that some $1,000 or $5,000 more was raised by private subscription to the Centennial Stock, making an aggregate of between $12,000 and $13,000. While the plans of the building were under advisement by the Committee, the Centennial Commission made an offer of the use of a part of the Pomological Building for this exhibit. It could have been partitioned off and altered to be in every way as large and available for the purpose as that part of the present Dairy Building *not* now occupied by the cheap hash-house or feeding-shop, and all this for about $3,000. Of course, if this were done, no room would be left for the soup and hash departments, nor would there be much profit upon the carpenter and mason work. It was decided by the Committee to reject the offer and build their own house. Plans were then submitted by Mr. Wilkinson and Mr. Blanding, and those of the latter were chosen, his estimate of the cost being $10,000. He proceeded with the building quite rapidly under the supervision of the Dairy Committee, of whom the active members were Messrs. Lewis, Scoville, Pope, Shull, Reall, Ward, Blanding, Hawley, and L. B. Arnold, who is also Judge and Jury of the Exhibits and receives a salary of $600 for the season. Mr. Pope was appointed Superintendent and Mr. Blanding Custodian (whatever that may be), while to Brother Hawley was given, I am informed, some minor office by which he was enabled to foot his board bills. What Mr. Pope's pay is for all his trouble is something "which no fellow can find out." Blanding built his house, and when it was about finished I took a builder to view it, in order to get an estimate of its probable cost. He examining it carefully and, after figuring on it, decided that it could be built for about $6,500. Blanding told me it cost him $10,300. He certainly must be a poor contractor or has made some serious mistake.

In the meantime Mr. Reall became dissatisfied with his co-members of the Committee and resigned by a letter in which he accuses the Committee, and especially Chairman Scoville, of all sorts of horrible things. Upon this resignation the Committee had a ridiculous pow-wow and spent a day in discussion, resulting in resolutions that Reall was a bad man, that they were all good men, and that the Blanding house was all right. They accepted Reall's resignation and refused to investigate themselves, all of which was eminently proper under the circumstances. The affairs of the Committee then progressed very smoothly in every way, except that the Exhibition, for which all the money was spent, did not exist. People did not send butter or cheese.

Mr. Blanding, having finished this cheese palace, found himself immensely out of pocket and asked his fellow-laborers (I believe that is the word) to permit him to run an eating-house in the building. Concession was obtained for that purpose from the Commission and a resolution offered in the Dairy Committee to give the *entire control and profits* of the restaurant to Blanding. Here began the little unpleasantness. Pope objected—nay, protested. But the balance of the Committee were better-hearted than Pope. They felt sorry for poor Blanding, who could only get $10,000 for a $6,500 building. They passed the resolution, and Pope recorded himself in the negative.

Meanwhile Harris Lewis, who is nothing if he is not as cunning as a weasel, had been sending communications to the various newspapers, defending the RING, to all of which he forgot to sign his name:

Yesterday, while on the ground, I went through the building. I saw a few cheeses, no butter, and a beggarly array of implements for manufacture. These were contained in about one-half of the first story. In the other half of this floor there were elegant rows of empty display stands, which presented the appearance of circus seats before the audience have been admitted. Upon the upper floor I found a large office devoted to the Superintendent and a minor office which seemed to be occupied by Blanding and Hawley during the little time they could spare from the supervision of the soup and hash department. There was also a large room fitted up with tables and seats for the accommodation of the soup customers; another one for a like purpose, and quite a number of smaller rooms devoted to hash-making, dish-washing and sleeping apartments for the waiter girls. In addition to this, the entire piazza surrounding the inner court of this floor is fitted up with seats and tables for feeders. One of the pleasantest sights which met my eye during my visit occurred at noon when the poor, unfortunate dupes, attracted by the signs of food, crowded forward to refresh the inner man. The unfortunate waiter girls were at their wits' end to supply the unusual demand, when Brother Hawley, whose eloquence upon the Salt question has enchained thousands of dairymen at the different conventions, stepped into the breach and helped the poor girls to wait on the tables. I always knew the old gentleman was kind-hearted, especially where the opposite sex appealed to him, but this spectacle almost brought tears to my eyes.

Mr. Pope, failing to carry his point against the restaurant, made strenuous objections to the use for such purposes of the large room designed for packing and preparing cheese for exhibition. In this he was sustained by the Commission, and the waiter girls have been locked out of this room. It appears to have been very inconvenient to Blanding, Hawley & Co., as they could have filled the room every mid-day with cash customers for their soup and crackers. Accordingly this gallant firm of Centennial caterers at once pronounced Mr. Pope entirely incompetent for his position of Superintendent and made charges against him, accompanied with a demand for his immediate removal and an apology for their mistake in having recommended his appointment. This roused Mr. Pope, who, in turn, made serious charges against both Blanding and Hawley, accusing the one of intemperate habits and the other of improper conduct, and asked for an investigation of the whole affairs of the Dairy Exhibition by the Chief of the Bureau of Agriculture. Accompanying his charges was a request that certain persons of both sexes should be forbidden to occupy quarters during the night in the Dairy Building. The last request was so eminently proper that the prohibition was made at once and the number limited to those who were absolutely necessary in carrying on the institution.

The Dairy Committee were called together by Mr. Hawley for the purpose of declaring Mr. Pope incompetent and requesting his removal; but they did not make their appearance. Judging from the fact that Mr. Arnold advised Pope to resign and then disappeared from Philadelphia, I should say that he, too, is in full sympathy with the "Eating-House Ring," but intends to do his fighting from a safe place.

Mr. Pope says he is not only competent to be Superintendent, but is equally competent to take care of himself and doesn't propose to allow himself to be driven away by any such element as is now seeking his removal. He intends to demand Blanding's accounts, and expects very interesting developments upon their presentation.

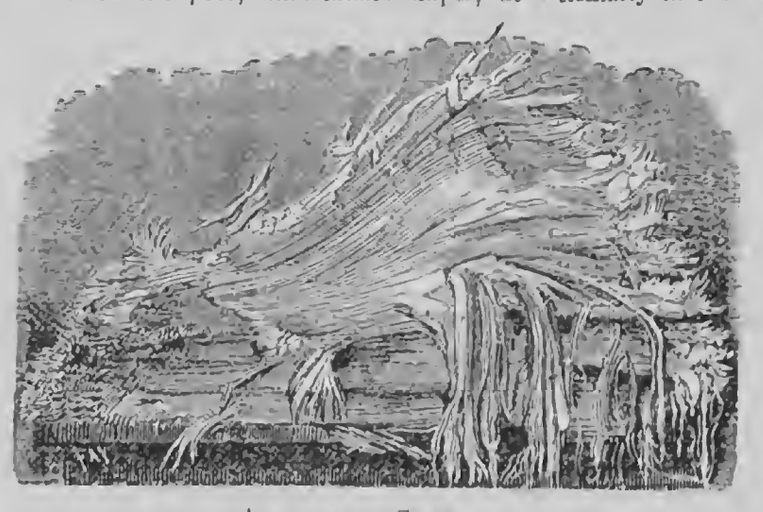
So stands the record to-day of one of the most disgraceful prostitutions of an important interest that this country has ever seen, and any one who attributes the above statement to any other than a simple desire to state facts, has only to make a thorough investigation to discover its truth. That the Dairy Exhibition is a total failure and that the Committee intrusted with its management have resolved themselves into a set of squabblers over spoils are facts which no one can deny who knows anything about the affair. A Committee which should have been above the breath of suspicion have failed to retain the confidence of even the careless Commission, who intrusted them with the entire control and management of this special Exhibition. That there are pure-minded men on this Committee there can be no doubt; but their negligence of their trust must have equaled their purity, or the whole Exhibition could not have sunk to its present depths.

"When rogues fall out honest men get their dues," and it is earnestly to be hoped that this internal dissension will be productive of sufficient cleaning of the Augean stables to permit a good Dairy Exhibition during the now short time the Centennial lasts. SHORTHORN.

SPECIAL EXHIBITS—ASBESTOS.

PHILADELPHIA, Oct. 6, 1876.

ASBESTOS is the sphinx of minerals—one can never guess at the extent of its possibilities. There is an exhibit at the Centennial, in Machinery Hall and in the Main Building, but particularly in the former, that is a most curious and instructive display. It is a monument to steady, patient endeavor, intelligently directed.



ASBESTOS OF COMMERCE.

What is asbestos? Why, it is a term. It is popularly presumed to be a mineral, but it is merely a term to denote a peculiar form assumed by several minerals. Tremolite, actinolite, and other forms of hornblende—excepting those containing alumina—pass into fibrous varieties, the fibers of which are sometimes very long, fine, flexible and easily separable by the fingers, looking much like flax. These and the corresponding mineral, Pyroxene, are called Asbestos. From the time of its first discovery it has consistently maintained its sphinx-like character. PLINY supposed it to be a vegetable product.

Its use among both Greeks and Romans was quite extensive, being woven into garments, gloves, napkins and funeral robes. It was a famous covering for bodies about to be cremated, as the ashes could be gathered up so nicely after the "firing-up" process was completed. The art of weaving asbestos was, until quite recently, a lost one. An Italian Count has latterly discovered the secrets of the ancients and is about to resurrect the process. The amianthus of the ancients is now applied only to the more silky and finer kinds.

Asbestos varies in color from white to green and wood-brown. The individual crystals are elastic, flexible, and have a fine lustre. The finest varieties come from Italy, but our own country furnishes the mineral in large quantities, notably, New York, North Carolina, Maryland, Pennsylvania and Virginia. The illustration above gives a somewhat accurate idea of the abestos of commerce.

Notwithstanding the mineral was so well known in former times, it remained for American industry to evolve the highest possibilities. It is to the credit of Mr. H. W. Johns, of New York, that he has, through untiring industry, been successful in shaping asbestos into various forms that renders it available for a multiplicity of purposes hitherto undreamt of.

Knowing that it was absolutely fire-proof, suggested the idea that it would make the best of roofing material; and as the mineral can be spun, woven, or felted, while yet retaining its fibrous nature, it became a valuable roof-covering, a purity of reasoning caused its application as a steam packing, and finally it was determined to try what could be done with asbestos as a paint.

It receives and contains the most brilliant colors, and experiment soon demonstrated that a superior paint could be produced. Not content with this great advance in the manipulation of asbestos, Mr. Johns has gone still further and made an absolutely fire-proof cement that, combined with other minerals forms an elastic, adhesive compound that is easily applied, and possesses a degree of toughness and durability that leaves nothing to be desired. The applications of these various products of this protean mineral will suggest themselves to the mind of the reader much more rapidly than they can be described.

Mr. Johns commenced manufacturing in 1858, confining himself to roofing materials, and from time to time has introduced the various other products, until up to the present time, when he is enabled to make a display to the nations of the world that command the respectful admiration of thousands, and compel the Grand Medal of Merit, and Diploma of Honor at the hands of the Jurors of Awards appointed by the Centennial Commission. Aside from its interest as a curious, and interesting display, it will well repay our readers who have yet to visit the Centennial to give this exhibit careful study, as it embraces materials that will at once appeal to their practical necessities. Y. R.

ORCHESTRIAN CHIMES.

OUR attention has recently been called to a new organ made by Horace Waters & Son, that combines so many new and excellent features that it is deserving of special comment. This firm has from time to time made and introduced improvements in parlor and cabinet organs, but their last novelty, Waters Orchestrian Chimes is in advance of anything heretofore to offend to the musical public.

The instrument has 12 stops, including a dulciana, concerto, piccolo, vox humana and tremolo, not to mention the Chimes which is its chief distinction. In volume, purity and resonance of tone, it more resembles a full organ than a cabinet instrument, yet it is sweet and soft as a lute when this effect is desired. Its action is easy and sprightly, and rare thing, the Chimes are positively musical! The case is convenience itself, being so arranged that the music racks, on either side the treadles, can be completely inclosed, and the upper portion can be converted into a writing desk as well. It is handsomely finished in walnut and veneers, and when not in use can be compactly closed, leaving none of the working parts subject to the inquisitive attentions of children. Style No. 1 is sold for $375, a reasonable figure when its many excellencies are considered. Messrs. H. Waters & Son are about to move into their new and elegant store in 14th St., facing Union Square, where the instrument above mentioned may be seen and heard by our readers, who pass through New York on their way to or from the Centennial.

THE "DEXTER" SPRING.

THIS is a novel application of spring power that has passed through its experimental existence, and is now a well-tried and assured success. The Dexter Spring Co., Hulton, Pa., during a business experience of three years, have sold over 8,000 springs, an unusual circumstance. They have yet to hear from a purchaser who is not well pleased with his investment, while the autograph letters in commendation of the article are flattering to an extreme degree.

The points claimed for this spring are: Strength, Durability, Beauty, Cheapness, and that it is Graceful, Noiseless, Light and of Easy Motion.

The Dexter consists essentially of two "concord" or side-springs upon each side, one spring above the other and parallel to it. The two springs are rigidly attached to each other at their centres, and are pivoted at their ends to spring links above, or on either side of axle and spring bar. The spring links are rigidly attached to the head-block and rear axle respectively.

The parallel motion of the springs prevents rocking of the axles. One spring being above the other prevents side motion and the settling of the body to one side. The absence of a reach allows either wheel to pass over an obstruction almost independently of the other wheels. The elasticity of the springs takes much strain off the fifth wheel, and cushions the stroke when striking an obstruction.

The slatted frame or body is held at its centre, and is free at each end.

No extra braces are needed to hold the wheels in track, since every strain tending to throw the wheels out of track comes upon the slatted frame or body, in a direction diagonal to its length,—the strongest direction possible. The Dexter has greater capabilities of carrying a light load easily, and again of sustaining a heavy load and carrying it easier. The workmanship is as perfect as skilled labor can produce. The irons used are of the best and the springs are cast steel, oil tempered.

M. Grier the Sec. of the company, exhibits this spring in the S. W. corner of the Carriage Annex Centennial Exhibition, where he also has a buck wagon that is used to practically test the qualities of the spring. We rode in this wagon over a vacant lot, near the grounds. The space was filled with heaps of rocks and rubbish in hillocks, and the horse and wagon were driven over and into this stuff in a way that would have wrecked an ordinary contrivance, yet the motion was not very violent, and the springs were not strained in the least. Such a test is, we think, conclusive.

Pomological.

ABOUT THE NEW PEACHES.

THERE have been so many contradictory statements going the rounds of the press in regard to the earliness of several of the new varieties of peaches, that we have made some efforts to get at the truth. Knowing that the veteran Pomologist, Mr. CHARLES DOWNING, had also paid some attention to these new sorts, we requested him to give us the facts as developed by his investigations and experience, and here they are in a brief note just received, which we think decides the question as to which is the earliest of the three sorts named. Mr. DOWNING writes:

The new peaches—Alexander's Early, Amsden's June and Honeywell—these all ripened this year so nearly at the same time that it is diffi-

cult to say what is the difference, if any. Last season the Honeywell ripened two or three days in advance of Alexander's Early, both growing near together; this season both are ripe at the same time. In another garden near here, Alexander's Early and Amsden's June, worked on the same tree, were in eating the same day, which would make the three varieties ripen at the same time. The fruit of each, in form, color, flesh and quality, are so near alike that I am unable to see any difference. The Honeywell however, has no glands, while the other two have.

If the record as to their origin is correct, there is no doubt that they are all of different origin, but not yet distinguishable, and all are probably seedlings of Hale's Early.

I have not seen High's Early Canada this season, but as shown last year, think it similar to the above kinds.

The Early Beatrice, in the same neighborhood, ripened about the same time, but was less in size, not as high colored, but more melting, higher flavored and quite free from the pit, while the others adhered slightly.

Now I do not say these peaches will all ripen at the same time, neither can any true decision be arrived at until all are planted in the same locality, near each other, the trees well established and have borne three or four successive crops.

[It would not be surprising if it should turn out that Hale's Early, like the old Indian or Blood peach and a few other well known sorts, would reproduce itself from seed, the difference in time of ripening being accounted for in the difference of soil and exposure.—ED.]

PACKING APPLES.

THE Wisconsin Horticultural Society gives through its report the following good advice on packing apples:

Under the term packing we include the whole operation of storing and keeping after picking, until finally disposed of. We recommend, as the best article to pack in, a well made, clean, new barrel, holding 2⅛ bushels, and perfectly seasoned and dry when the fruit is put in it. Take the barrel under the tree or near it, and taking out the head fill it a little more than level full, and then cover with short boards so as to exclude sunshine and rain, and with two or three sticks of stove wood, or some means of keeping the bottom of the barrel off the ground, leave it for a week or two to sweet and dry out, when the head must be pressed down to its place and the hoops driven on tight, and nailed on both ends. If the barrel is not level full when headed up, it must be made so, as this is most essential to prevent after handling of the barrel bruising the apples. Failure in this one thing of pressing the contents of the barrel, so that there shall be no loose apples, and no working in any manner of the whole or any part of them, will involve serious danger of loss of all the labor previously bestowed; and yet we find that right here is the great neglect. Right picking and right packages are all useless if afterward the fruit is bruised in consequence of loose packing.

We greatly prefer to put the fruit immediately into the barrel in the orchard, and head up the barrel before it is moved, to the method so often recommended of picking and carrying to some out-house or chamber to cure before packing; as it saves much labor, involves less risk of bruising, and requires less time. When the barrels are headed up, they may be laid on the side, on sticks, and left in the orchard if the weather is fair, or removed to some out-house, barn, or any place where they will be dry and cool. It is a good way to lay down some poles and rails near the cellar where they are to be kept during the winter, and lay the barrels on them, and cover them temporarily with boards. The point to be aimed at is to keep them as cool and dry as possible, and out of the cellar till winter or very freezing weather, as it is a well-established fact that an apple will bear more cold and freezing without affecting its quality than any other fruit or vegetable, especially if kept in the dark and all air excluded. Another reason for choosing tight packages is that light and air in conjunction with warmth rapidly change the structure or internal condition of the fruit and induce decay. The same agencies which operated in maturing and perfecting it will, after it is matured, ripen and afterward destroy. It is essential to success in keeping fruit in any manner, or by any method, to keep this fact in view and to be governed by it.

The writer has known apples packed as above directed and put in a dark cellar, to be frozen solid, clear through, and remain so for weeks, and on being opened in May, show no signs of injury in looks or taste. There is no question but that it will always pay to pack apples as herein directed, even if they are to be sold immediately, and there were never so many apples on the market but there would be remunerative prices paid for such by parties knowing how they were picked and packed. In commencing to fill the barrel with the apples, some advise placing the layer all with the stem end down, which gives a fine appearance when opened, and helps to sell it; of course there is no harm in doing so, provided you do not select larger and better specimens for that layer, as looks are to be regarded as desirable just as long as they do not deceive. We advise in all cases, instead of putting apples in a cellar to keep for Spring and Summer use, to have one especially devoted to that use, or to partition off a room in it which can be kept cold, even below the freezing point, and at the same time be dry. We repeat that there is more danger from warmth than cold, from light than darkness, from handling than from lying still. Lastly, mark each barrel distinctly with the variety and grade on the end which should be opened.

ANOTHER EARLY PEACH.—C. L. W. of Stanton, Kan., writes that he has a new seedling peach that ripened this season the 28th of June, and the entire crop had ripened and gone by July 4th. It is claimed to be two weeks earlier than Hale's Early.

Floricultural.

OVERLOOKRD WILD PLANTS.

"We look too high
For things close by."

OFTEN at this season of the year while every night we are dreading frosts which cannot at best be long delayed, we have noticed while riding over the country or walking through the fields, the rich purple, the lilac and the white Asters that bloom in countless numbers and almost solid sheets along hedges, upon hills and in vales. We have looked at these many times, admiringly perhaps in a general way, as one would look over a green field admiringly and yet never know or care whether it was a field of clover or of grass.

Last fall a friend in the West sent us several roots which were placed in the conservatory and turned out in the spring. They grow amazingly and we soon detected a suspicious resemblance in them to our familiars of the hedges and fields. "What are they?" we asked of our friend when in the summer he called at the RURAL office—"they look like weeds." "Just wait" he replied with a confident look that they could not fail to surprise us with their beauty—and we waited. Two weeks ago, the buds began to unfold. Some of the plants had grown to a hight of five feet. All are now a sheet of purple and yellow and lilac and yellow, the latter not so tall by a foot as the others. Our suspicions proved to be the truth. The first is *Aster Novae Angliae*. For those who have not observed this plant—and strange as it may seem, they are many—let us briefly say that the stems are rather slender and much branched. The leaves which are close together and necessarily very numerous, are as much as three inches long upon the main stems and less than an inch upon the branchlets — narrow, stem-clasping and auricled. The flowers are nearly two inches across, the rays of a beautiful bluish-purple and the discs yellow. Upon one of these plants which we have said is five feet high, we count 350 flowers.

Had our friend, who though a great lover of plants, cares little in respect of their botanical relationship, not said "just wait" we should probably have pulled these Asters out of the shrubbery plot in which they are growing and thrown them away. But we were willing, perhaps a little curious, to note, under cultivation, what there was about them that should have induced him to express them to us from the West, that, though growing in wild abundance about us at home, had so long escaped our notice. Well, it is simply the fact that we can not divest ourselves of the depreciation with which we view wild plants that bloom about us in almost every quarter. *A. Novae Angliae* otherwise would unquestionably be deemed worthy a place in any part of the garden, as, indeed, it is so deemed in foreign countries to which it is not indigenous. But whether or no, we will say to our friends, who are collecting native plants for the laying out of a wild garden, that these late and profuse-blooming Asters should certainly find a place.

The other (*Aster undulatus*) reminds us in its inflorescence of the several shrubs sometimes called Bridal Wreaths such as *Hypericum* and the flowering Plums, its flowers being in curved racemes and bearing ten where *Novae Angliae* bears one, though but half the size. The color of the rays is a delicate lilac while the discs are lemon at first and reddish as they fade. Although under cultivation they form a solid mass of bloom, they are prettier close by than at a distance when the effect is somewhat hazy and neutral.

HANGING BASKETS.

THE handsomest hanging baskets I have seen this season were filled, one with Kenilworth Ivy, and the other with Maurandya Vine. Both plants were raised from seeds, sowed last spring, with no especial care paid them. Good drainage and copious watering being all that is required for their rapid growth.

The Kenilworth Ivy was in a large basket with numerous plants growing near the edge, which had grown into a perfect tangle all over and around it. The dainty leaves and diminutive flowers, made it a charming ornament. The foliage of the Maurandya Vine has such an Ivy-like appearance that those unacquainted with it are surprised at its superb, brilliant, foxglove like blossoms. It is easily grown from seeds or slips. The plants are difficult to separate after being grown near together, as the leaves and branches intertwine and cling so tightly, that it is almost impossible to part them without injury. These vines are exceedingly graceful, while *some* of the plants, used for hanging baskets, are inclined to be rather stiff in appearance.

No. Fairfield, Ohio, MRS. L. E. K. TURNER.

EXCHANGE.

I WAS much pleased with your plan of giving space for the benefit of those wishing to exchange roots, seeds &c., &c. I shall have a large quantity of Dahlias next spring which I would like to exchange for any of the following:—Chinese Paeonies, Tulips, Hyacinths, Crocus, Anemones, Crown Imperials, Cyclamens, Scillas, Lillies except Tiger, etc.—or for many of the hardy shrubs or any novelties. I have probably as fine a collection of Dahlias as can be found—four hundred different varieties, one-half seedlings of my own growing. The above named bulbs should be sent this fall by those, if any, who wish to exchange for the above collection of Dahlias.—A. G. BISBEE, *Chester Cross Roads, Ohio.*

I have been reading the description of your flowers in the RURAL NEW-YORKER from time to time, and, being a great lover of flowers, feel much interested in them. I have a quantity of tubers of Madeira Vine (*Boussingaultia basseloides*) and bulbs of the Pink Lily (?) and would be much pleased to exchange with any subscriber a tuber and a bulb for either of the following: Chinese Yam (*Dioscorea batatas*), *Triloma uvaria*, *Caladium*, *Amaryllis* or any of the Japan Lilies, Tigridias or Smilax.—MRS. L. P. HUGHES, *Quakertown, Union, Indiana.*

I have a good stock of seeds of *Celosia Japonica* and Snapdragon (mixed colors) which I would like to exchange for Asters, mixed colors, and Pansies of the large flowering kinds. It hardly pays to cultivate the old China Asters and little Johnny-jumpers now-a-days, but I have been obliged to wait for our Centennial Exchange to come along to help me to something better. I have also some Amaranths, different varieties—would exchange for same.—MARY WALEY, *Poquonoc Bridge, Ct.*

NOTES.

FLORIDA.—A gentleman, writing to the Rural Home from Florida, says. "In this famed "Land of Flowers" flowers are so scarce and difficult to raise that we are anxious to get all that can be made to grow here."

LILIUM AURATUM in this climate very seldom, if ever, displays the beauty and luxuriance induced by special culture and a more congenial climate. The Journal of Horticulture speaks of a plant that last year attained a hight of 11 feet; and this year the same bulb threw up a spike 10 feet 6 inches in hight. In the same garden this year one clump, the offspring of three bulbs, produced 170 flowers. The soil in which these Lilies thrive in such a remarkable manner is sandy loam, having an admixture of peat, the subsoil being sand. They grow among Rhododendrons and are watered copiously, though for a long time watering, as also manure, were considered quite injurious if not fatal to them. Partial shade and liberal supplies of water are now regarded in England as the main elements of success.

Entomological.

CONGRESS AND THE GRASSHOPPER.

AT the close of the late meeting of the Agricultural Congress, Prof. CHARLES V. RILEY of Missouri offered the following preambles and resolutions, which we think should be heeded by our National Legislature:

Whereas, The people of some of the Western and Northwestern States have again been afflicted by the Rocky Mountain Locust scourge; and

Whereas, The devastations of this insect form the most serious obstacle to the settlement and welfare of much of the country between the Mississippi and the mountains, and have become a national calamity; and

Whereas, There is yet much to learn of the native breeding-places of the pest, and some hope that, by more thorough knowledge of those native breeding-places and the causes of migration therefrom, we may be able to prevent invasion into the more fertile country to which the species is not indigenous; therefore,

Resolved, That it is the emphatic opinion of this Congress that some action should be taken by the National Government that will have for its object the palliation or extinction of this crying evil.

Resolved, That we consider that Congress owes it to the people of the West to take this matter into consideration, and we call upon the next National Legislature to follow the example of other nations under like circumstances, and appoint a special commission for thorough investigation on the subject.

Resolved, That the passage of some such bill as that introduced during the last Congress by Senator Ingalls of Kansas (S. 438), while contemplating the investigation of a few other insects of national importance, such as the cotton worm of the South, would have been of vast moment to the people of the South and West, and would have brought about the needed investigation into the Locust question.

Industrial Societies.

NEW HAMPSHIRE STATE FAIR.

MANCHESTER, N. H., Oct. 5, 1876.

THE Twenty-Second Annual Fair of the New Hampshire State Agricultural Association is now in progress here, and promises to be a financial success. The show in many of the Departments was fully up to the average—especially in cattle, which is fine. In this class working cattle takes the lead and there are several fine teams. Frank Jones, Portsmouth, N. H., showed one team of 13 Yoke of oxen that are very fine—one pair weighing over 5,700 lbs. Chester Pike Cornish, N. H., showed a fine team of 10 Yoke. There was not a very large show of Short-Horns, Devons taking the lead. Ward Parker, Amherst, made a fine show of this breed, as did also John B. Sanborn, E. Concord. Warren Daniels, Franklin, exhibited a good herd of Jerseys. Peter Jones showed several fine Jerseys and Ayrshires. Henry Elwell, Langdon, N. H., a herd of Short-Horns. Arthur Cluff, Canterbury, N. H., a lot of Herefords. The State Reform School made a good show of grades. The cattle displayed were more for milk than any other purpose, good grades taking the lead of pure Bloods in this state.

The show of sheep was not large, some good Cotswolds with a few Merinos and about 25 grades being all. Swine were well represented, about equally divided between the white and black breeds. The show of Poultry was large, including a good show of Dorkings, Hamburgs and Game fowls, but very few Asiatics. Pigeons, Turkeys, Geese and Ducks were well represented, with a few very good specimens in each class. The show of fruit was the largest this society has made for some time. Small fruits of all kinds have done well here this year hence this fine display. The Flower and Plant show was monopolized by J. T. Smith & Sons, Brentwood, N. H. H. H. Huntress, Manchester, and Dunlap & Co., Concord, each making a fine exhibit. The Dairy exhibit was a failure, half a dozen cheeses and a few samples of butter being all there was to see in this department. The show of Agricultural Implements was not as large as usual, the Centennial keeping many of the large exhibitors away.

Messrs. Everett & Small, Boston, Mass., made a fine exhibit of their New Improved Holbrook Swivel Plows, Charter Oak-Lawn Mowers, Acher Self Dump Rakes, (which took the highest award at the Centennial) and Bradley's reversible Harrows.

The Ames Plow Co., Boston, made a fine display of Plows, Cider Presses, Mills, &c. They have brought out a new Swivel Plow this year which they have named the Centennial. It has been thoroughly tried and has given good satisfaction.

R. B. Hakes, Worcester, Mass., showed his Patent Swivel Plow. Mowing Machines were represented by the "Haymaker," "Buckeye" and "Wood's Eagle." Horse Powers and Threshers, by A. W. Gray & Sons. Hay Rakes by the "Archer," "Gleaner" &c.

There was the usual show of home-made work and curiosities filling the Domestic Art and other departments. The California Polo Club and a series of Horse Trots were used to draw a crowd, which with these inducements was run up to about fifteen thousand yesterday. To-day it has rained so that the attendance was small. To-morrow will be the Gala day as all the mills will close, and as at the present writing it bids fair to be pleasant, the managers anticipate a large crowd. The thanks of your correspondent are due to Secretary Young and Superintendant Fling for courtesies extended. NIM.

Scientific and Useful.

READY MADE FOOD FOR PLANTS.

Science and Scientists, are supposed to assist agriculturists in obtaining useful information as well as those occupied in other industries. The chemist, mineralogist and geologist are working in fields where discoveries are constantly being made which may be turned to valuable account by the tillers of the soil, and we may add that the farmer is well aware of this fact, hence he looks to these men for light upon subjects in which he is especially interested.

That there are men making these branches of Science a specialty who would not scruple to deceive others for a consideration, cannot be denied, but we are pleased to say that they are the exceptions to the rule. Occasionally however, some real or supposed scientist makes a ludicrous mistake and it is frequently the case that it is difficult to determine whether it was intentional or the result of ignorance, and it is in this rather unsettled state of mind that we find ourselves in examining the claims of Prof. J. B. Wilson of Baltimore Md., in regard to the value of diatoms as the food of plants. It is well known that the immense beds of fossil diatoms found in various parts of the world, have attracted the attention of scientists who have endeavored to utilize them, and in a measure they have been successful, but Prof. Wilson has of late put forth claims as to their value as a fertilizer, or as we may term it, "ready-made food for plants," which are simply astounding to any one who knows the rudimentary principles of chemistry or vegetable physiology; in fact he has so overshot the mark that the merest tyro in either of the above named branches of science will be enabled to detect his blunder, if we call it by no worse name. Strange as it may seem however, the Professor's lucubrations have been published in such respectable Journals, as Silliman's American Journal of Science, (London), and also admitted to the pages of the Monthly Microscopical Journal, (London), without scarcely a comment, either as an indorsement of theories advanced, or a criticism upon them; consequently we are inclined to think that, if such scientific journals can be hoodwinked into publishing such statements other, and less able periodicals, may also do the same, and that many converts may thus be made to a very ridiculous theory, which may be summed up in a few words, to wit:—Professor Wilson claims that the "*silica of Grasses and other plants is carried up as Diatoms, or other siliceous grains, and not in solution or as soluble silicates*," or to put it in less scientific but plainer language, that the stems of plants are built of diatoms as a boy would build a cobhouse, there being no dissolving of elements in the process.

But the farmer may ask where is he to obtain this wonderful diatomaceous or infusorial earth which will supply the ready prepared materials to make wheat, oat, and rye straw, and just here we will let out the secret of the above wonderful discovery of Prof. Wilson. There is a large bed of this precious earth on the eastern shore of Chesapeake Bay, owned and for sale at a certain price per ton, and right here we can, to use a homely phrase "account for the milk in that cocoa-nut."

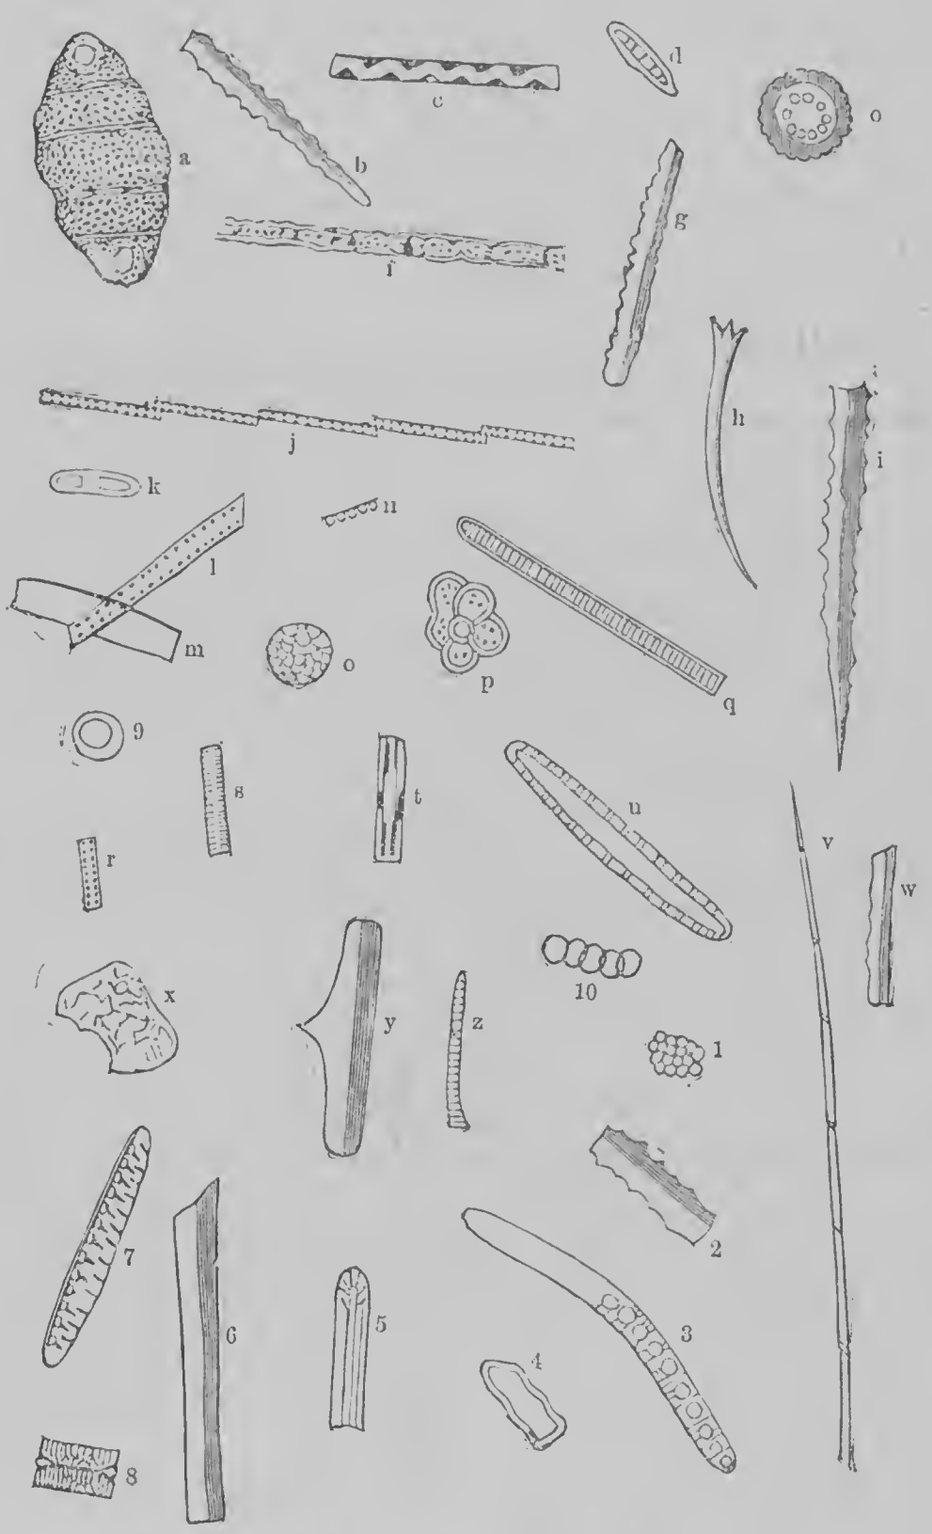
But lest the readers of the Rural New Yorker should fail to appreciate this "great discovery," we have procured a copy of the original illustrations of the wonderful diatoms &c., which Prof. W. found in Col. Kunkel's straw, grown on this now celebrated infusorial earth, found on the shore of Chesapeake Bay. For the accompanying illustration we are indebted to that wide-awake and invaluable monthly, the Journal of Microscopy of this City, edited by the widely known Scientist, Mr. John Phin.

But we will quote a few extracts from Prof. Wilson's own letters in regard to his discovery. In a letter to Messrs. G. A N. Porlein, he says:

"In making these investigations, thorough precautions were observed, to cleanse the straw from all accidental impurities by washing and gentle friction, not sufficient however, to destroy the epidermis. This was to profit by Ehrenberg's experience, and investigation of dust showers, which he has found to contain some infusorial forms. The organic matter was then removed by the prescribed methods, aided by my own experience.

My labors have been amply rewarded by one of the most enchanting views, that has ever fallen to my lot to behold through twenty years of varied scientific investigations. When the epidermal silicious coating was adjusted upon the field of the microscope, some thirty-six forms of the diatomaceæ, which I have carefully sketched, were observed (see wood cut magnified 300 diameters), where perfect disintegration has been produced. When the structure to a great extent is retained, the marvelous interlacing of these forms present themselves, sometimes side by side, at other times overlapping, showing with what vigor and regularity nature performs the dictates of her laws.

This investigation is final. It overthrows all theories that have ever been advanced, that silica enters into plant structure in combination with the alkalies, the alkaline earths, or the earths proper. Chemical investigation led me to this conclusion some months since, now confirmed by that of the microscope. A new era has dawned upon the science of agriculture. By close observation and strict scientific investigation, *new information* will be brought to light to reward the tiller of the soil for his time, labor and capital. * * * * * These microscopic investigations show the absence of other forms of silica, that is, in granular particles in the (Kunkel) straw, they being entirely replaced by diatoms. This leads to the conclusion that the diatom is the more acceptable for assimilation and when sufficient infusorial remains are present, replaces any other divided form of silica."



FORMS OF DIATOMS FOUND IN COL. KUNKEL'S STRAW.
MAGNIFIED 300 DIAMETERS.

And he endeavors to impress his readers with the trust-worthiness of his observations by the following self-gratulatory sentence:

"I look upon this application of vegetable silica to fertilizing purposes as the most important adaptation of matter for the reproduction of vegetation that has ever been discovered. It is the first step in a new direction, rationally conceived and judiciously carried out: a new impetus to the study of plant physiology will be given, and demonstrate that more than a heterogeneous mixture of elementary bodies, and their compounds, is required for the production of the crops beneficial to the requirements of man."

Now all this is certainly grand and beautiful if we could only believe it, but here comes the editor of the Journal of Microscopy and knocks down that cob-house. Hear him:

"A single glance at the engraving to which he so confidently refers is sufficient to convince any microscopist that Professor P. B. Wilson never saw 'upon the field of his microscope,' under the circumstances which he has described, the objects which he has delineated. This is a bold assertion, and a severe accusation, but the proof is simple and unimpeachable.

"Bearing in mind that these organisms, as figured, have been obtained by destroying the organic matter with nitric acid, we find *Bacillaria* (Fig. j) figured as it exists only in the living condition—the frustules being joined together in the peculiar way which has given to this form the specific name *paradoxa!!!* For this diatom to have passed through a bath of nitric acid, and come out in the condition figured, would have been almost as great a miracle as the passing of Shadrach, Meshech and Abed-nego unscathed through the fiery furnace of Nebuchadnezzar. So, too, we find a *calcareous* foraminifer figured at p under the same circumstances! Verily this is such a view as has not 'fallen to the lot' of ordinary microscopists to behold—either in twenty, or in four times twenty years."

After such instances, the numerous minor features which are utterly irreconcilable with facts, and which are found in this plate, may be safely passed over.

We may look with complacency on the Moon Hoax of Locke, and the extravaganza of Dr. Neulenz and his discoveries, effected by means of an objective of 135 1-10° of angular aperture, for these *jeux d'esprit* were harmless, and tended only to create a little amusement. But such a fabrication as the present is of a much more serious character, since the hard-earned dollars of the farmer are paid out on the strength of these so-called scientific investigations, and so obviously and demonstrably erroneous are they, that it must bring a blush to the cheek of every scientific man in the country, when he reflects that Silliman's *American Journal of Science and Art*—a journal which claims to be the foremost scientific authority in America—should have lent its aid to the propagation of such nonsense.

Since writing the preceding article, we have submitted an impression of the engraving accompanying Prof. Wilson's article to one of our ablest diatomists, and requested him to note for us the names of the "some thirty-six forms of the diatomaceæ which he (Prof. Wilson) has carefully sketched." The following is his reply:

" * * The miserable wood cut shows a mixture of marine and fresh water diatoms, sponge spicules, a little of the silicious cuticle of the straw, and a foraminifer. Only one form belongs to the Virginia deposit, with which Kunkel's field was fertilized (?)—and which is exclusively *marine*. That one form, a, is possibly a side view of *Biddulphia tridentula* of Ehr., though it is much more in front view.* Figures 2, b, g, i, w, and possibly l, m, y, are portions of the silicious cuticle; c is a front view of a *Cymatopleura*, fresh water; d, a *Denticula*, fresh water; e, *Cyclotella*, brackish; f and v are some vegetable remains; h, probably a sponge spicule; k and t are side and front views of a *Dialomella*, or possibly, and perhaps more likely, a *Mastogloia*, marine or fresh; n is a fragment of 7, 3, *Epithemia ocellata*, fresh water; o, uncertain; p, foraminifer, (*Rotalina?*) marine; q and s, side and front views of *Synedra*, fragments, marine or fresh; r, fragment, front view of j, which is side view of *Bacillaria paradoxa*, marvellously carried up in connected series through the cell walls, but not dissolved, being *vegetable* silica!!; (u) is probably a *Surirella*, fresh water; x, y, z, 1, 10, 6, 5, 4, are doubtful; 8, portion of a *Tessela*, or possibly of a *Tabellaria*."

The Garden.

CUCUMBER NOVELTIES.

There is a general impression that all of the commonly-cultivated varieties of Cucumbers are good enough, and that there is little chance, or need, of improving them by selection or by the introduction of foreign sorts. The Early Frame, White Spine, etc., being prolific and easily grown without the use of frames, are raised year in and year out—and any possible difference between them and foreign novelties in favor of the latter, is thought so unlikely to occur that few are willing to purchase new seeds at a high price and devote land and labor to experiments which promise so little.

There is, however, as we have ascertained during the past season, room for improvement and probabilities of improvement which have rendered our own experiments well worth the time and labor bestowed upon them.

The season, as our readers know, has been dry, so that the following results should be deemed rather the least than the most that can be said in favor of the varieties tested.

Green Prolific.—The pleasing tale is told of this Cucumber that it is the offspring of fifty years' selection—whether by one Cucumber-struck individual or by the younger members of the family continuing the selection commenced by their parents, is not stated. Think not that we are ironical. So far from us is the wish to belittle the creditableness of this statement that we publish it as a rare instance of unselfish perseverance and assiduity in such little things, too, from which stunning revelations could scarcely have been dreamed of and which, had they been lavished upon something besides a Cucumber, might have carved an enduring name that, with Huxley, Tyndall and Darwin would bury itself in the gratefulest recesses of the grateful hearts of men.

This Cucumber—this Green Prolific Cucumber—has an origin, too, worthy of the pains bestowed upon it through fifty years of selection, progression and evolution. It has been handed down as a natural cross between the Green Cluster and Long Green, and again crossed (a "Derivation Hybrid," you see) with the White Spine. Perfection in form and quality thus secured, as was supposed, "the growers found that some hills were more prolific than others; and by keeping these for seed hills and saving the first and most perfect Cucumbers only for seed, the bearing qualities were gradually so much improved that, with good care, an acre will produce 200,000 *and more* pickles." It is to be regretted that the exact number an acre will produce is not given, since our own experiments upon a small scale will not allow of an arithmetical computation. Besides—and it is a circumstance to discourage the most sanguine—the labors of creation and fifty years' selection all reverted, in our grounds, so entirely to the rude first principles that, were it not for the stakes and labels marked "Green Prolific," we should never have known this Cucumber of so high an ancestral name, from one of its unassuming parents—the White Spine!

Khiva Netted.—Those who do not care much for Cucumbers, and who do care much for ornamental Gourds, will likely enough be delighted with this novelty. As a Cucumber, except for those who relish seeds and a flesh that if not exactly tender, is exactly tough, the Khiva Netted is a failure. But as an ornamental Gourd it is a surpassing success—the greater in that we find we have cultivated a thing to tickle the optic (which we did not seek), instead of a thing to tickle the gustatory nerve (which we did seek).

They grew to the estate of Cucumbers early and were productive until the drought, to which they are quickly susceptible, killed the vines. The shape of this Cucumber is short and thick, the skin is smooth, first green, next light-brown, then reddish-brown—cracking all over in the middle stage and showing a light color underneath, thus forming the fine netting which makes the name appropriate. Russian Netted is less a novelty, having been grown, to a limited extent, for several seasons. The Cucumbers are not so large as the Khiva Netted (averaging four inches long), though of the same form and color. They were more productive, and continued to bear

after the Khiva vines were dead. We may say for both the Khiva and Russian Netted that they make excellent pickles (when young) being of a pretty and uniform shape and of a firm substance. Only for this purpose we should prefer them to any of the old sorts commonly used.

SWAN NECK.—This is a long, fleshy, nearly smooth variety, the "neck" sometimes growing like that of the squash, though not generally crooked. The flesh is white and good—the vines moderately productive. It is advertised as growing from two to three feet in length. We give the advertisement every benefit. The largest of ours were one foot in length. All things considered, it is a good Cucumber and we recommend its trial at least to our friends.

TAILBY'S HYBRID.—A more taking name would have been *Cucumis sativus hybridus Tailbyi*, and one destined, we should say, to excite more inquiry. This is not, as one might suppose, a cross between a Squash, Pumpkin, Watermelon or Muskmelon and a Cucumber, but merely a cross between two varieties of Cucumbers, viz., the White Spine and "a large English sort." In spite of its name, however, it is the best Cucumber we have ever eaten, and our family and several friends are of the same opinion as to themselves. We shall cultivate it next year in preference to any other and doubtless the year after that, should succeeding years not change our predilection already formed.

Its color is a deep green, and its shape is between that of GEN. GRANT or LUTON HOO, which reminds one of a fat Cucumber drawn out to thrice its natural length, and the plethoric Russian Netted or White Spine.

The flesh is greenish, and so tender as to be almost melting. The seeds are few and small, the vines prolific and hardy.

Domestic Economy.

BILL OF FARE.

THE World gives the following bill of fare for eight persons:

Sorrel soup.
Boiled striped bass; caper sauce; Stewed potatoes.
Calf's-head *a la poulette*; Succotash.
Roast teal ducks; Celery salad.
Apple fritters.

To make sorrel soup:—Take two quarts of sorrel, remove the stems, cut it fine, cook in a sauce-pan, with salt and white pepper; boil five minutes, add to it a quart of water and a quart of veal and chicken broth; boil again; put in a soup tureen the yelks of four eggs, two ounces of butter and half a pint of boiled milk; mix well; then pour in the boiling soup in the tureen slowly and carefully, while stirring the eggs; mix well again, add two French rolls, sliced thin and serve.

Calf's head *a la poulette*:—Take a white calf's head—(this has no political significance!)—take all the skin and flesh from the bone, soak it an hour or so to take the blood off, boil it for five minutes, cool it and scrape the white skin from the tongue and cheeks, cut it in about ten pieces, cook it in a saucepan with salt water (a handful of flour mixed with it), a little vinegar and a garnished bunch of parsley.

Then for the poulette sauce:—Put in a saucepan a knuckle of veal, with salt, pepper, vegetables, spices and three quarts of water; skim well and boil for two hours; put in a separate saucepan two ounces of butter, three tablespoonfuls of flour; cook awhile, but do not let it take a brown color, add some of the veal broth, boil fifteen minutes; skim the grease off and mix carefully with the yelks of four eggs, diluted with a little water; boil a minute, pass forcibly through a napkin, finish with a good lump of butter, the juice of a lemon and two tablespoonfuls of chopped parsley; pour some on the head and the rest in a bowl.

ORIGINAL RECIPES.

"M. W."—To Prepare Citron for Cake.—Preserve citron in the usual manner, boiling the sirup until quite thick, but instead of closing the jars leave them open for the air to enter. The preserve will then dry gradually, and you will have a very good substitute for the West India citron.—MRS. RUSTIC.

CAKE RECIPES.

Prison Cake.—White part: 1 cup butter, 5 cups white sugar, 5 cups flour, 2 cups of sweet milk, 1 teaspoonful soda, 2 cream of tartar, whites of eight eggs. Dark park: 1 cup butter, 2 cups of brown sugar, 1 cup of molasses, 1 cup of sour milk, 1 teaspoonful of soda, 4 cups of flour, yelks of eight eggs, fruit to taste. Divide each part into three cakes and bake in long or square tins. When done place one above another alternately, three cakes in a tier. This makes two cakes, one having two light bars and one dark and the other two dark bars and one light. The bars give it the name of prison cake. It is very pretty and excellent in quality.

Raisin Cake.—1 cup sugar, ½ cup butter, ½ cup of milk, 1 teaspoon cream of tartar, ½ of soda, 1½ cups of flour, 2 eggs, 1 cup raisins.

Em's Ginger Cookies.—2½ cups molasses, 1 brown sugar, 2 cups shortening, 3 eggs, ½ cup sour milk 3 spoonfuls soda, 2 tablespoonfuls ginger. Just flour sufficient to roll out. Care must be taken not to mix them much. Just get the ingredients mixed, and enough flour in them to get them rolled out and in the tins.

One-Egg-Cake.—1½ cup sugar, ¾ cup sour milk, ½ cup butter, 1 egg, ½ teaspoonful soda. Don't mix very stiff.

Mrs. Page's Fried Cakes.—1½ cups sugar, ½ cup shortening, 1 tin cup of sour milk, 1 spoonful saleratus.

Soft Ginger Cake.—2 cups molasses, 1 of butter, 1 of sour milk, 1 egg, 1 tablespoonful of ginger, 1 teaspoonful of saleratus, 3 cups of flour.

Variagated Cake.—1 cup of butter, 2 of sugar, whites of eight eggs, 1 cup sweet milk, 1 teaspoonful soda, two of cream of tartar. Flavor with lemon. Spread a layer in a long baking pan, and put two lines of red sugar sand near each side the length of the cake. Spread another layer of cake and put one line of sugar sand through the center, then spread a final layer of cake. When cut it presents a variagated appearance.

White Fruit Cake.—1 cup of butter, 2 of sugar, 1 of sour milk, the whites of three eggs, the whole of one, 1 teaspoon of soda, 2 of cream of tartar, over one cup of raisins, stoned and floured.

Cookies.—2 cups of sugar, 1 of butter, 1 egg, ½ cup sweet milk, 2 teaspoonfuls of cream and tartar, 1 of soda, nutmeg. Flour enough to roll out. Strew sugar over the top and roll in before cutting them out. Place on a paper or cloth to cool before piling them up to store away.

Cream Cake.—1 cup sugar, 2 eggs, 1 tablespoonful butter, 3 tablespoonfuls sweet milk, 1½ cups of flour, 1 teaspoonful soda, 1½ cream of tartar.

Cream.—1 egg, ½ cup sugar, ½ cup sweet milk, ½ cups cornstarch.

DECREASE AND INCREASE OF RACES.

A PARAGRAPH has been going the round of the papers this week showing that the population of France does not increase, while the populations of Germany and England do, and thereupon have been based a new series of glorifications of the two branches of the Teutonic stock, which are visibly taking possession of the world and will before long make it a place too tiresome to live in.

The London Spectator characterizes this as boasting and says, that it is not unnatural for every race to think that the future belongs to it. But it is becoming a little wearisome and the boasters in their vain-glory are becoming a little too contemptuous of all but momentary facts. They will have it that the French cannot colonize because Frenchmen, being now contented at home, choose to stay there rather than "fight the wilderness" as people in London, who appeal to the magistrate because cocks crow, think it the bounden duty of Frenchmen to do—and forget that the only colony which Frenchmen, as distinct from the French government, ever seriously attempted to found has been a perfect success, has lasted 100 years, has remained intensely French—though French of the pre-Revolutionary type—and has alone among foreign communities resisted successfully the absorbent influence of the dominant Anglo-Saxon race. The French settlers in Canada formed one of the happiest, best ordered and most peaceful communities in the world: and after a history of a hundred years, and after suffering conquest by the English, that community remained French, still unabsorbed, with a life and a society and a mental atmosphere all its own. Half a dozen French Canadas, would, we admit, be better than one, but still the French has established one which has not died. The boasters assert that the Germans colonize, and forget that, like the Irish, they do nothing of the kind; never conquer, never "settle," never found, but simply "go abroad" to be absorbed into the new English speaking race which is gradually filling up North America, and which may be destined, if the Chinese immigration does not interfere with the process, permanently to occupy the splendid spaciousness of that continent.

The English, it is true, colonize, but the concurrent assumption that they will always go on colonizing, or indeed multiplying, is a mere assumption without evidence in science and strongly against the evidence of history. They may, but also they may not, for if there is any historic subject upon which philosophers, historians or savans are still profoundly ignorant, it is the law under which races increase, become stationary or decrease in numbers. Some economists used to believe they had discovered a law—namely, that races increased under prosperity, that plenty of food meant plenty of population, that with manufactures States obtained more hands to work them; but it was entirely opposed to the facts of history, which show that one of the most miserable of earthly races—the Irish under the penal laws—multiplied like flies, while another race of the same blood and under nearly the same conditions—the French peasantry under Louis XV.—were slowly perishing away. The negro slaves of the South, amid all their toil and with all their poor food, increased faster than their masters. Statistics show that the English people in the Western States of the Union tend always to increase, though the same people in the Eastern States are dying slowly out; while a people as brave, as strong, and once as prosperous as they are, with lands as wide and far more fertile, with a history of conquest behind them, and everything to gain from the increase of their numbers, is stationary everywhere, and in some places slowly receding. If there is a law proportioning population to means of subsistence, why do not the Spaniards and Portuguese, who still own wider and fairer territories than we English, fill them up with population; while Mongolians increase till China cannot contain them, and Bengalees multiply under foreign domination until the problem of feeding them is studied as one of the gravest of the future? The fierce, beef fed islanders of whom Froissart wrote were as well off as ever Englishmen have been, as well off as Ohio citizens are now, yet the population of Britain increased almost imperceptibly, while in Ohio the same advances now by leaps and bounds. To talk of epidemics is useless, for it only pushes back the question one step, the secret of liability to epidemics being but one of the secrets of increase or decrease of population.

Indeed it is very doubtful if prosperity or the provision of means of subsistence is the ultimate cause of increase of population, for the upper classes die out sooner than the lower, and one main difficulty of civilization is to keep culture sufficiently hereditary. After a thousand years of feudalism, the "noble" classes of France were ascertained, says De Tocqueville, when the Revolution broke out, not to reach 200,000 in number, while the patriciate of Rome, the best off class that ever existed, died completely out.

If the explanation is health, why does not the Jewish race, which has had nearly 2,000 years in which to spread abroad, which thrives in all climates and under all conditions, which suffers less than any from epidemics and which, 3,000 years ago, established a sanitary code, number 200,000,000, as, had they been Englishmen, they would have done? They were oppressed? Yes, and so were the Irish, and so are the Chinese and the Bengalees, with at least as grievous an oppression, different as it may be in kind. Why do not the well-to-do, brave and physically powerful Parsees show any tendency to regain the numbers they possessed before the Mussulmans so nearly extirpated them? If the secret is race, why did the Greek people, after swarming over the islands and Asia Minor and Egypt, leave off spreading and become stationary? Nobody is oppressing Greeks in Greece, and yet Greece is not filled up. Why is not an island like Samos eaten up, as Ireland was, by its own children? "Peasant proprietorship," answers the Times, which, with equal division of property, always tends to keep down the numbers of a population afraid to become too poor. Very good; that is definite and intelligible; but will the Times just explain why those other peasant proprietors, the majority of the men in the United States, do not die out, while their rivals, the Spaniards in South America, do; or why Bengalees, every one of whom is a peasant proprietor, living under the most peremptory law of equal division of property, are becoming too numerous for their land? It is all climate? Very good, but which climate breeds large races?

We English grow and grow in the South, and Provencals do not grow in their lovely land, and Italians grow slowly in their equally lovely one, and the Spaniards in Chili, which is Italy over again, are nearly stationary; while the Irish, in their cold, humid country, grew too fast, till nature avenged herself in a frightful famine. Why does not a race like the Dutch, which can colonize, and fight, and sail ships, and blunder about the world just as we and the Germans do, grow out of its dykes, as either of the kindred families would? There is no room? There is endless room in Scandinavia and Holstein, and the Scandinavians and Holsteiners, who once settled here and in America have grown to 70,000,000, yet, in their own territories, they scarcely grow at all. Is it religion? Well, the most rapidly increasing races are the English Protestants, the Irish Catholics, the German Freethinkers, the Bengalee idolaters and the Chinese worshippers of the Manchester ideas. Is it virtue? Chinese swarm, and Puritans decay. Is it energy, the extraordinary force which appears in each race at some moment of its history, and after a longer or shorter period dies out? Well, there is something to be said for that solution, vague and indefinite as it is. The great period of some races, as the Roman, the Spanish, the Arab, has been synchronous with their swarming period; but still that does not explain facts like the population of Ireland, or the increase of the negroes in slavery, or the advance of the Bengalees, or the swarming out of the Chinese everywhere, or above all the increase believed, on strong evidence, to be occurring among the Slavons. The French must have increased once, why not again? The English population fell back once, why not again? The circumstances of, say, Michigan are said to be so fortunate that the filling up of Michigan without immigration would cause no surprise: but why should Michigan fill faster than the South African settlements, which fill so slowly that, after Europe has possessed them for a hundred years, it is doubtful whether tribes, in nothing raised above the red Indians, and in religion decidedly below them, may not eat up the white man after all? The plain truth of the matter is that we have not discovered the law on which the increase and decrease of the races of man depend, and that therefore all these hymns now sung over our colonizing capacity and these rather exulting dirges over the decay of France, may be caused by movements which, in the long life of nations, must be pronounced only momentary. Numbers for numbers, the Portuguese did more to colonize the world than we have done and took up a higher position in it, and, except when she worries us by claiming some South African port or some West African slave trader, who thinks of Portugal now?

THE BENEFIT OF LAUGHING.

THE saying of an old School teacher that "when children were laughing, their minds were expanding" is forcibly called to mind in reading the following excellent comments on laughing by DR. GREENE in his Problem of Health. There is not the remotest corner or little inlet of the minute blood vessels of the human body that does not feel some wavelet from the convulsion occasioned by good, hearty laughter. The life principle, or the central man, is shaken to its innermost depths, sending new tides of life and strength to the surface, thus materially tending to insure good health to the persons who indulge therein. The blood moves more rapidly, and conveys a different impression to all the organs of the body, as it visits them on that particular mystic journey when the man is laughing, from what it does at other times. For this reason every good, hearty laugh in which a person indulges, tends to lengthen his life, conveying, as it does, new and distinct stimulus to the vital forces. Doubtless the time will come when physicians, conceding more importance than they now do to the influence of the mind upon the vital forces of the body, will make their prescriptions more with reference to the mind, and less to drugs for the body; and will, in so doing, find the best and most effective method of producing the required effect upon the patient.

Our advice to all is, indulge in good, hearty, soulful laughter when the opportunity offers, and you will derive material benefit therefrom. A merry heart, a cheerful spirit, from which laughter wells up as naturally as bubbles the springs of Saratoga, are worth all the money-bags, stocks, and mortgages of Wall street. The man who laughs is a doctor, with a diploma endorsed by the school of Nature; his face does more good in a sickroom than a pound of powders or a gallon of bitter draughts. If things go right, he laughs, because he is pleased; if they go wrong, he laughs, because it is cheaper and better than crying. People are always glad to see him, their hands instinctly go half way out to meet his grasp, while they turn involuntarily from the clammy touch of the dyspeptic, who speaks on the groaning key. He laughs you out of your faults, while you never dream of being offended with him; it seems as if sunshine came into the room with him, and you never know what a pleasant world you are living in until he points out the sunny streaks on its pathway.

A good-humored laugh is the key to all hearts. Satire says a keen observer, "Is the most useful of all forms of writing; sentiment is literally wasted on nineteen readers out of twenty!" The truth is, that people like to be laughed at in a genial sort of a way. If you are making yourself ridiculous, you want to be told of it in a pleasant manner, not sneered at. And it is astonishing how frankly the laughing population can talk, without treading on the sensitive toes of their neighbors! Why will people put on long faces, when it is so much easier and more comfortable to laugh? Tears come to us unsought and unbidden. The wisest art in life is to cultivate smiles; to find the flowers where others shrink away for fear of thorns. Surely it is not the best theology that teaches that He who has given such fulness of joy to beasts and birds, delights in the misery of men, or that, having filled our hearts with gladness, we ought to give the lie to His goodness by wearing faces beclouded with woe, and furrowed with unhappiness.

"PROGRESS AND IMPROVEMENT."

THE RURAL NEW-YORKER,

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

ANDREW S. FULLER, Editor.

SATURDAY, OCT. 14, 1876.

PRICES ARE FALLING!

THE PRICE OF

THE RURAL REDUCED TO $2.50

TO SUIT THE TIMES.

Club Prices Reduced Proportionately.

Mindful of the great encouragement which has been extended to us in our efforts to improve THE RURAL, *we have concluded to show our appreciation of the same by reducing the price of* THE RURAL *to $2.50 per year,*

POSTAGE INCLUDED.

By doing this we ourselves pay the postage, which has heretofore been paid by the subscriber. In addition to this, we inaugurate a graduated scale of prices for small clubs, so that all who send names with their own, up to ten, can get a reduction for each name so sent. And for a club of ten or more, a beautiful premium in addition. Now that THE RURAL *has come down, let each subscriber send with his or her own name that of at least two neighbors. Those who wish to become new subscribers or agents can receive Specimen Copy and Premium List free. Address*

IS IT BEST, OR EVEN SAFE?

FARMERS, like men in other pursuits, have different ways of doing the same thing. It is doubtless true, however, that they all seek the shortest road to reach the same point, whether it be in fattening cattle or raising a field of grain. The near approach of winter will remind many of our readers of the fact that there are many things to be done preparatory to its advent, both for the household and the animals which may be in their care; and while not assuming to preach a homily on such affairs, or attempting to give directions as to how a man should feed and shelter his family or stock, we will offer a few hints in regard to the importance of proceeding in these matters upon the supposition that the winter may be a severe one for both man and beast. It is a question worthy of consideration whether it is best or safe to proceed upon any different hypothesis; for the wisest weather-prophets often fail in their prognostications and promised mild winters turn out to be very severe ones, and those who depend upon prophesy are frequently greatly disappointed.

Of course we are not disposed to turn alarmist, or urge upon our readers the necessity of making extraordinary preparations for warding off calamities which may never come; still, it is better to be prepared for a long siege than a brief one. The man who provides an abundance of food and a safe and comfortable shelter for his animals, can look more complacently upon the coming storm and fret less upon its long duration than he who has made no such provision for them. The same is true in regard to his family, and there may be smiles within, while the blast howls without, when the larder is full and old Boreas is kept at bay by solid, tight walls and close-fitting doors and windows.

Every recurring spring we hear of severe losses of stock through a scarcity of food or exposure to cold, and severe storms, all the result of carelessness in making preparations beforehand for what is likely to happen even in what are termed mild climates. An old veterinarian once told us that his services were always in most demand in the latter part of winter and early spring, for when warm weather came and a plentiful supply of wholesome food, his services were seldom, if ever, needed.

Now it is not safe to "guess" that next winter is to be a mild one, for it may turn out to be quite the contrary; therefore, we say, prepare for the worst, even if a little food is left over and the stables and sheds are a trifle too warm. Every green thing which can be made available should be saved; the smallest turnips, beets, carrots, and other roots, will be far better than none, and a stack of bog-hay or straw more acceptable to your stock than a snowbank. If you wish to have stock free from foot-rot and frozen feet, let them have a dry, warm place for their feet; and to keep away lice and other vermin, attend to cleanliness of stables and sheds, not forgetting that parasites of this kind seldom attack well-fed and warmly-housed animals. Prevention in such matters is far cheaper and better than a cure; and it is not safe to trifle with what most persons call fate, but which nine times out of ten is nothing more or less than the legitimate results of some infringement of the laws of nature.

Half starved and unsheltered animals are the natural prey of parasites and contagious diseases, just as the old monarchs of the forest become the rendezvous of myriads of insects and cryptogamous plants upon the first indications of declining vigor. This fact is so well known, that horticulturists watch their trees and so soon as they find one which is checked in growth, an examination is made for parasites. So long as a plant or animal can be kept growing, they possess the power of resisting enemies to a greater or less degree; but feebleness from any cause invites enemies. When our farmers and others learn to use stimulants just sufficient to preserve health and no more, they will have found one of the best preventives of disease. Under such a condition of things, it is not best or safe to trust to uncertainties; but prepare for the worst, and then we will come out so much ahead, if our fears of a hard winter or hard times should prove groundless.

DEAD DAIRY RING.

"WHEN rogues fall out, honest men get their dues." This we now quote from the letter of our Centennial correspondent on another page of this issue. Like the TWEED Ring and the Coal Combination, this combination to convert the Dairy Exhibition at Philadelphia into an immense job for the benefit of a few interested individuals, has fallen by its own weight. Internal dissensions and quarrels over the spoils have produced a result which not only justifies the position taken by us in the beginning, but enables our investigator to get at facts which, in the time of peace among the spoliators, were hidden secrets. We could name several of our contemporaries of the Agricultural Press, who have wasted more printers' ink in abusing the RURAL than we have used in exposing the machinations of the Ring. What have they now to say? Has there been a Dairy Exhibition at the Centennial. Is not nearly the whole Dairy Building occupied by and used for a cheap restaurant, the profits of which go to Mr. BLANDING and whomsoever he may see fit to share them with? Has not a resistance been made to the encroachments of the eating house and has not the man who made the resistance been recommended for removal by several of the very men who caused his appointment? Is the Dairy Building not worth much less than $10,000, which is charged for it? Are not the Committee and its executive head at variance with each other and in a constant quarrel?

When these few questions can be answered in the negative, we are willing to admit that we are wrong and to further admit the charge of personal feeling in the matter. In fact, the latter charge we are now willing to admit for the following reasons:—The RURAL, probably more than any other paper, has for a series of years made a specialty of encouragement and assistance to the Dairy interests and information to Dairymen and has been always so deeply interested in the progress of this important industry that to behold such an exhibition of jobbery, trickery and resultant failure in a place where all nations are the spectators, seems like razing to the ground at one fell swoop the very edifice which we have spent years in assisting to erect. Hence our feeling against the men who could, in plain view of all the nations of the globe, so belittle the national character of our Dairymen and so injure the reputation of their manufactures. But as we are satisfied that most of the matter printed by these contemporaries was supplied by apologists for and members of this very combination who have heretofore borne good reputations, we cannot entirely blame them for their abuse. Now however, without a refutation of all the statements published herewith, we cannot see how our friends of the Agricultural Press (and *friends* we certainly regard them) can continue their defence of this party of speculators. If they will make a complete personal examination of the whole subject on and off the Centennial grounds, we believe their verdict will be the same as ours. Be that as it may—we have presented the facts and now the Press and the Dairymen may dream over them.

RURAL NOTES.

A Big Honey Story.—The Editor of Gleanings in Bee Culture complains of the admission into the RURAL NEW-YORKER's columns, of an article from an exchange, wherein the writer says he has "often known a good strong stock to gather fifty pounds in the long days of August, when the white and Alsike clover were in full bloom." We thought this a pretty strong story at the time, but having become accustomed to "big stories" from bee keepers, we let it pass without comment and, while begging the pardon of the Editor of the afore-mentioned journal for publishing the offending article, still he should not censure us too severely, as it might lead some faithless ones to go into the business and become purchasers of his comb foundations or Tea-kettle Bee Feeders. Who knows but that the fifty pound story is a blessing in disguise to our complaining Editor?

Sanctum Personals.—Among the late pleasant intruders in our sanctum were FRANK BRAMER of the Warrior Mower Co., Little Falls, S. N. GALLUP, Genl. Agent of the Bickford & Huffman Grain Drills, Macedon, N. Y. We were also pleased with visits from Mrs. W. A. HART, whose handsome husband has RURALized Allegany Co. for many years, Mr. GEO. A. GREENE our Club agent at Andover and Mr. A. P. WILCOX, who reports "all right" in the region of Hobart, Delaware Co. Mr. KNAPP of Whitney's Point, also called to see what we had to say about his increased list of names last year and Mr. SMITH, all the way from Canada, was mindful of our whereabouts. Verily, these meetings face to face with our patrons and agents, are a delightful thing. Come along, one and all and don't forget to call!

New Papers.—We have been complimented of late by receiving several new exchanges. The Red Bud Courier, Red Bud, Ills., is a bright four-page paper devoted to TILDEN and local interests. The Editors say:—"We have entered into the enterprise of publishing a weekly paper in this city which is intended to be profitable to ourselves," Illusive dream! Nevertheless, we wish our new contemporary every success.

—The Wisconsin Farm Journal is a new venture in Agricultural journalism published at Madison, Wis. It is illustrated, and if Mr. E. B. ROLLINS the proprietor, sustains succeeding numbers in the spirited manner which distinguishes the initial issue, he may be justly complimented.

—East Weymouth, Mass., is to be congratulated on the first number of the Weymouth Courier. The salutatory is somewhat didactic, as it perhaps should be, coming from Massachusetts; but the make-up, printing and paper is much above the average of local papers.

Thunderbolts in Cities.—A late writer has labored hard to show why large cities escape thunderbolts, attributing it to the number of gas and water pipes in the ground and in the buildings extending from roof to basement. Now the theory is all very well as advanced, but it does not hold good when tested by facts, for it is well known that our cities do not escape thunderbolts, and the number descending to the earth in them is fully as great as in the same area in the country, or where there are no buildings.

Lightning Rods.—From the number of notices of swindles perpetrated by venders of lightning rods which have of late appeared in the columns of our cotemporaries, we conclude that fear of the electric fluid is on the increase among our rural population. But if a lightning rod will allay the fears of a man and his family, it is a good thing to have about, whether it is really any protection or not, as most of our troubles are imaginative at best.

RURAL BREVITIES.

THE late decline in the price of coal is a blessing to the poor of all our large cities; they will be able to keep warm if not well supplied with food.

THE newspaper prophets who predicted great destruction of property by the blowing up of Hell Gate, had better try their hand at some other business, as they are evidently not very trustworthy prophets.

WINTER apples are reported to be both abundant and of excellent quality this year. The late varieties, in most localities, appear to be fully mature consequently, will keep with little danger of loss from rotting.

OUR foreign exchanges give the great Centennial show splendid notices; in fact, in some instances we think they praise some departments more than their merits deserve; still, we are used to considerable praise and can stand it.

THE old "Sweet and Sour" apple is again being discussed, and many are the claimants to being its originator. Now gentlemen, if you will only look into the Pomological works, you may find that this old and well known variety is older than the oldest man living.

THE American Pomological Society, as it appears, did not hold a meeting at the Centennial, as was expected. The illness of its President, Hon. MARSHALL P. WILDER, prevented his attendance, and as the Captain of the Pomological ship was absent, the old vessel failed to obtain sailing orders.

RUMOR has it that the "Champion" Manufacturers of Springfield, O., have purchased of the OTIS BROTHERS the "Haymaker" patents and will astonish the harvesting community with some entirely novel combinations of inventive genius next season. Verily, friend WHITELY is a giant among machine men, and a handsome man, too!

VARIOUS misrepresentations have been made by boarding-house runners upon trains going to Philadelphia, that the Atlas Hotel is too full to accommodate any more guests and many people have thereby been induced to go to dearer places for lodgings. The Atlas has accommodations for 5,000 guests and can always take in a few more.

A FAIR WOMAN.

Eyes full and quick; with breath
Sweet as double violets,
And wholesome as dying leaves of strawberries;
Thick silken eyebrows, high upon the forehead,
And cheeks mingled with pale streaks of red,
Such as the blushing morning never wore;
With narrow mouth, small teeth,
And lips swelling as if she pouted;
Hair curling and covered like buds of marjoram,
Part tied in negligence,
Part loosely flowing.

CHINESE LADIES AND THE PUG-NOSED DOGS OF THE COUNTRY.

Our illustration gives a more than usually accurate idea of Chinese women and their very comical pug-nosed dogs. It will be seen that the natives here depicted are quite different in appearance from those who have immigrated to this country; and in forming an estimate of this most conservative people, it will be well to bear in mind that the representatives of the better classes rarely immigrate. It is different with the dogs, which have become the rage in London.

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 237.]

OREGON.

In 1848 the population of that part of the French cession lying west of the Rocky Mountains, had reached such a number that a Territorial Government seemed necessary; consequently, one was organized by act of Congress passed in August of that year, covering the area bounded by the parallels 42° and 49° north latitude, the Pacific Ocean and the Rocky Mountains. In 1859 the number of population in the southern part of the Territory was found large enough to entitle them to a State Government, and on application that portion lying south of latitude 46° and the Columbia River and west of longitude 17° and the Snake River, was admitted as a State.

MINNESOTA.

Had the provisions of the ordinance of 1787 been fully complied with, that portion of Minnesota east of the Mississippi River would have been comprised in the fifth State made from the territory north-west of the Ohio and have formed part of the State of Wisconsin. But on the admission of Wisconsin to the Union in 1848, the river St. Croix was fixed as its western boundary and the country between the river and the Mississippi, together with the adjoining country as far west as the Missouri and the White Earth Rivers, was set apart and in 1849 established as the Territory of Minnesota. At this time the Sioux Indians held possession of considerable of the country, but in 1851 the United States Government obtained title to all the territory between the Mississippi and the Big Sioux River. At this time the population of the territory was only about 5,000; but from the erection of the Territorial Government immigration rapidly increased and on application the State was admitted to the Union in 1857, with boundaries as at present, viz.,—north by the 49th parallel, Lake of the Woods, Rainy Lake River, Rainy Lake and the Water connection between Rainy Lake and Lake Superior—east by Lake Superior and Wisconsin, from which it is separated by a line drawn due south from the first rapids in St. Louis River to the St. Croix River, and by the St. Croix and Mississippi Rivers south to Iowa and west by Dacotah, from which it is separated by the Red River of the North, the Bois des Sioux River, Lake Traverse and Big Stone Lake, and a line drawn due south from the outlet of the last-named lake to the north line of Iowa.

CALIFORNIA.

The first discoverer of California is supposed to have been Cabello, a Portuguese in the employ of Spain in 1542. By him Mendoza (now Mendocino) was named, in honor of the then Viceroy of Mexico. Spaniards from Mexico made early explorations in all the territory now in the United States lying south and west of that ceded by France in 1803, and Spain held possession thereof until it came under the Government of Mexico. There appears to have been an early desire on the part of the United States to obtain it, while as strong desire was manifested by England and Spain to prevent such a transfer of title. In 1835 an attempt was made by President Jackson to purchase all the territory "lying east and north of lines drawn from the Gulf of Mexico along the eastern branch of the Rio Bravo del Norte up to the 37th parallel of north latitude and along that parallel to the Pacific Ocean," but it was frustrated by British interference; and again in 1845 our Minister to Mexico was instructed to negotiate the purchase, but English diplomacy again prevented it.

About 1842 immigration from the United States became considerable and soon increased to such extent as to awaken the jealousy of the Mexican settlers, and collisions were frequent. An attempt was made under a feigned purpose to drive the Americans from the country. A rebellion ensued; the Americans sought the protection of Col. Fremont, who was then in the country on a special exploring mission, having with him a party of 62 guides and frontiersmen. A flag was constructed bearing as its emblem a grizzly bear—denotive of force and courage, around which the Americans rallied in opposition to the Mexican Government. With this hastily-formed army Fremont commenced operations and by a few well-planned and hasty movements had nearly conquered the country when, in July, came Commodore Sloat to Monterey with news of the existence of war between the United States and Mexico. Commodore Stockton soon followed with troops and took possession of California, claiming it as a territory of the United States. But little fighting was necessary to obtain complete occupation, and the treaty with Mexico spoken of in connection with Texas soon put an end to all difficulties.

During this time secret negotiations had been going on between England and Mexico and the British Consul had completed arrangements by which California was to be placed in possession of England. Admiral Seymour had been lying at Monterey for some time to aid in the completion of the arrangement, but, suspicious of the movements of Commodore Sloat, followed him out to sea one day. At night Commodore Sloat returned, took possession of the town, and when the English admiral returned from his trip he found the American flag where he had expected to raise the Cross of St. George.

Notwithstanding efforts to establish a Territorial Government for California, the slavery question for many years prevented a consummation thereof and Military Government was continued. Finally the people, tired of this state of affairs, held a Convention and agreed upon a Constitution, naming their boundaries as they now exist, and declaring that slavery should be prohibited. With this they made application in February 1850, for admission as a State. The South objected to any action that would not permit slavery anywhere south of 36° 30', although the territory acquired from Mexico was free soil. Then came the famous compromise of 1850 reported by Mr. Clay, providing that California be admitted as a State with Constitution as adopted; that Territorial Governments be provided for the rest of the area acquired from Mexico without action relative to slavery therein; that the north and west boundaries of Texas be as they now exist and agreeing to pay Texas ten millions of dollars in consideration of the relinquishment of certain territory claimed by that State. This compromise was agreed upon and California became a State September, 1850.

The passage of this Compromise bill had the effect to raise the price of Texas bonds from about 30 per cent. of the nominal value to nearly par. If this payment of money was in any way conducive to the passage of the bill, it was probably the second instance of pecuniary interests controling the vote of Congress—that of the location of the District of Columbia being the first.—[To be continued.

The Story-Teller.

A LITTLL FADED FLOWER.

BY SEVEN AND NINE.

"Oh! please, sir, it is the last one. *Won't* you buy it? My poor child ——"

He had alighted from his coupe and was on the point of passing in at the stage door of a theater when this sad appeal met his ears.

The comedian—for it was a petted performer—looked at me with a gentle, caressing air, which changed into absolute pity as his eyes fell on my owner's pallid face.

"It's of no use to me, my good woman," he began; "but—well, give it to me. There you are, and for Heaven's sake get yourself something to eat."

He placed a piece of money in her open palm, took me up hastily, and passed into the theater.

"Overture played over twice—time I was on, eh? Here, mavourneen, here's a little present for you—no earthly use to me; have oceans of them at home—admiring friends, you know."

And before I could say *presto!* I had changed hands for the second time.

The hands I now found myself in were very little and very pretty ones, and they belonged to a young lady whose splendor of dress and beautiful appearance would have quite frightened my unsophisticated self had not her sweet face, her low, musical voice and gentle manner immediately reassured me. I fell in love with her instantly. Then I looked around and took in the situation.

It was but one more page of the old, old story—one more edition of the old song which has been set to such sweet music any time these thousand years, only this particular little edition had a new and special accompaniment, so to speak, of its own.

She, my new owner, was at the moment waiting to be called on and was, meantime, the object of most ardent attention from a faultlessly-attired young fellow, who seemed to engross her in a most serious conversation. He spoke in a low, pleading voice. It was an interesting topic, as I had good reason to know. I laid close over a beating heart and could look up into downcast, glistening eyes. Her perturbation was so great that I have no doubt she would have felt it a great relief to have been called from the scene of genuine emotion to its stage counterfeit, that was at the moment in full blast before the footlights. Her suitor evinced no disposition to relax his urgent question, however, until his pleading was rewarded with some positive assurance.

The call-boy flashed in and out, leaving a streak of sound behind him that formulated itself into the announcement that she was "called."

"You hear," cried the young fellow, ardently. "Now or never! For the last time, if you do not hate me—if you will only trust me—give me some token; just the least little bit to take away with me to-night, that I may cherish and treasure, feeling that it is a proof of your love for me, or that you do not absolutely bid me have no hope."

The call-boy again!

"Stage waitin', ma'am," he vociferated.

She raised her eyes and the light in them grew tenderly luminous as she murmured:

"I *will* trust you, Fred. See!" She took me from her bosom, kissed me and put me into his hand. "And—I love you with all my heart. I will never forget you. Don't forget *me!*" She fled through the door and the applause told she was in front of the audience.

My new master put me in his buttonhole but somehow he did not seem as joyful as he should have been. His face shone triumphantly the one moment, but the next was very dark. He sighed heavily and I heard him mutter:

"Jove! what a jolly mess I am in, to be sure. Pshaw! I'm a regular brute. How *can* I break with Millicent? What business has a poor devil like myself with *love?* Can't afford it. Well, I must show up at the Stebbinses to-night. Millicent will expect me."

My master passed out of the little back stage-door and was soon rolling along the avenue to keep his appointment. We dashed up to a brilliantly-lighted mansion and it was not long before my owner was treading the mazes of a Strauss waltz with a proud-looking, beautiful girl.

We danced several times with the same lady, went down to supper and then retired to the recess of a window that looked out into the thoroughfare.

"That's a very fine camelia, Fred; where did you get it? Let me look at it—nearer, please."

He flushed nervously and muttered something about "persistent little flower-girl; bought it to get rid of her."

She held me up to the light, looking scornfully the while. Then she muttered an angry little cry.

"You have deceived me shamefully! *Who gave it you?*"

I was held at arm's length in haughty scorn. Too well I knew to what she referred. There was a tiny, vivid red streak in the center of my petals. It was *rouge du theater* from the face of my late sweet little mistress!

My master was silent. Again the question floated out, distinct but low, through the open window. No answer, and in the awkward silence I seemed to be conscious of a kind of choking sob coming from directly under the window.

"Then I know what to think," she continued icily, "and of course *you* will know what to do. Your letters and presents will be at your rooms to-morrow."

"Stay, Millicent;" he gasped. "That flower *was* given me by a lady; but—but she is nothing to me, absolutely nothing! Look, this is how I value her and it!"

And, snatching me from her hand, I was tossed out into the street. I fell under the wheels of a passing vehicle and was crushed out of all consciousness.

When I recovered I felt bruised and sore; every in my body had been torn by those cruel wheels, but was I not in the road! Who could have rescued me? Who, think you, laid me away so carefully in this satin-lined casket?

CHINESE LADIES AND THE PUG-NOSED DOGS OF THE COUNTRY.

Whose, indeed, are those little hands that have taken me up so tenderly on her return from the theater for all these long years? Do I not know their gentle touch—do I not know that sweet, sad face which regards me so tenderly—that low, musical voice, whispering *that one* name—those sweet lips which, pressed to my unworthy self so closely, linger on me in this long, passionate kiss!

Ah! the sad stories that could be told by little faded flowers!—*N. Y. Clipper.*

A STRANGE STORY.

It was getting towards midnight when a party of young noblemen came out from one of the clubs of St. James street. The servant of each, as he stepped upon the pavement, threw up the wooden apron of the cabriolet and sprang to the head of the horse; but as to the destination of the equipages for the evening, there seemed to be some dissension among the noble masters. Betwixt the line of coroneted vehicles stood a hackney coach and a person, in an attitude of expectancy, pressed as near the exhilarated ground as he could without exciting immediate attention.

"Which way?" said he whose vehicle was nearest, standing with his foot on the step.

"All together, of course," said another. "Let's make a night of it."

"Pardon me!" said the clear and sweet voice of the last out from the club, "I secede for one. "Go your ways, gentlemen!"

"Now, what the deuce is on foot?" said the foremost, again stepping back on the sidewalk. "Don't let him off, Fitz. Is your cab here, Byron, or will you let me drive you? By Jove, you shan't leave us!"

"But you shall leave me, and so you are not foresworn, my friend! In plain phrase, I won't go with you! And I don't know where I shall go; so spare your curiosity the trouble of asking. I have a presentiment that I am wanted—by devil or angel—

"'I see a hand you cannot see.'"

"And a very pretty hand it is, I dare swear," said the former speaker, jumping into his cab and starting off with a spring of his blood horse, followed by all the vehicles at the club door save one.

Byron stood and looked after them a moment, raised his hat and pressed his hand on his forehead. The unknown person who had been lurking near, seemed willing to leave him to his thoughts, or was embarrassed at approaching a stranger. As Byron turned with his halting steps, however, he suddenly came to his side.

"My lord," said he and was silent, as if waiting for permission to go on.

"Well!" replied Byron, turning to him without the least surprise and looking closely into his face by the light of the street lamp.

"I come to you with an errand which, perhaps ——"

"A strange one, I am sure; but I am prepared for it—I have been forewarned of it. What do you require of me, for I am ready?"

"This is strange!" exclaimed the man. "Has another message, then——"

"None except a spirit—for my heart alone told me that I should be wanted at this hour. Speak at once."

"My lord, a dying girl has sent for you!"

"Did I know her?"

"She has never seen you. Will you come at once? and on the way I will explain to you what I can of this singular errand; though, indeed, when it is told, you know all that I comprehend."

They were at the door of the hackney coach and Byron entered it without further remark.

"Back again!" said the stranger, as the coachman closed the door, "and drive for dear life, for we shall scarce be in time, I fear."

The heavy tongue of St. Paul's church struck twelve as the rolling vehicle hurried on through the now lonely street; and though far from the place from whence they started, neither of the two occupants had spoken. Byron sat with bare head and folded arms in the corner of the coach, and the stranger, with his hat crowded over his eyes, seemed repressing some violent emotion; and it was only when they stopped before a low door in a street close upon the river, that the latter found utterance.

"Is she still alive?" he hurriedly asked of a woman who came out at the sound of the carriage wheels.

"She was—a moment since. But be quick!"

Byron followed quickly on the heels of his companion and passing through a dimly-lighted entry to the door of a back room, they entered. A lamp, shaded by a curtain of spotless purity, threw a faint light upon a bed, upon which lay a girl, watched by a physician, who had just removed a small mirror from her lips and holding it to the light, he whispered that she still breathed. As Byron pressed the edge of the curtain, however, the dying girl moved the fingers of the hand lying on the coverlet and slowly opened on him her languid eyes—eyes of inexpressible depth and luster. No one had spoken.

"Here he is," she murmured. "Raise me, mother, while I have time to speak to him."

Byron looked round the small chamber, trying in vain to break the spell of awe which the scene threw over him. An aspiration from the other world could not have checked more fearfully and completely the worldly and scornful undercurrent of his nature. He stood with his heart beating most audibly and his knees trembling beneath him, awaiting what he prophetically felt to be a warning from the very gate of Heaven.

Propped with pillows and left by her attendants, the dying girl turned her head towards the proud, noble poet standing by her bedside, and a slight blush overspread her features, while a smile of angelic beauty stole through her lips. In that smile the face reawakened to its former loveliness and seldom had he who now gazed breathlessly upon her, looked on such spiritual and incomparable beauty. The spacious forehead and noble contour, still visible, of the emaciated lips, bespoke genius impressed upon a tablet all feminine in its language, and in the motion of her hand and even in the slightest movement of her neck, there was something that still breathed of surpassing elegance. It was the shadowy wreck of no ordinary mortal passing away—humble as were the surroundings and strange as had been the summons to her bedside.

"And this is Byron?" she said at last, in a voice bewilderingly sweet even through its weakness. "My lord, I could not die without seeing you—without relieving my soul of a mission with which it has long been burthened. Come nearer; for I have no time left for ceremony, and I must say what I have to say and die! Beautiful," she said, "beautiful as the dream of him which has long haunted me! The intellect and the person of a spirit of light! Pardon me, my lord, that, at a moment so important to yourself, the remembrance of an earthly feeling has been betrayed into expression.

She paused a moment and the bright color that had shot through her brow and cheek faded and her countenance resumed its heavenly serenity.

"I am near enough to death," she resumed, "near enough to point you almost to heaven from where I am; and it is on my heart like the one errand of my life—like the bidding of God—to implore you to prepare for judgment. Oh, my lord! with your glorious powers, with your wonderful gifts, be not lost. Do not, for a poor world like this, lose an eternity in which your great mind will outstrip the intelligence of angels. Measure this thought—scan the worth of angelic bliss with the intellect which has ranged so gloriously through the universe; do not, on this one momentous subject of human interest—on this alone be not short-sighted!"

"What shall I do?" suddenly burst from Byron's lips in a tone of agony. But with an effort as if struggling with a death-pang, he again drew up his form and resumed the marble calmness of his countenance.

The dying girl, meantime, seemed to have lost herself in prayer. With her wasted hands clasped on her bosom and her eyes turned upward, the slight motion of her lips betrayed to those around her that she was pleading at the throne of mercy. The physician crept close to her bedside, but with his hand in his breast and his head bowed, he seemed but watching but for the moment when the soul should take its flight.

She suddenly raised herself on the pillow. Her long brown tresses fell over her shoulders and a brightness, unnatural and almost fearful, kindled in her eyes. She seemed endeavoring to speak and gazed steadfastly at Byron.

Slowly then and tranquilly, she sank upon her pillow, and as her hands fell apart and her eyelids dropped, she murmured, "Come to Heaven," and the stillness of death was in the room. The spirit had fled.

CANAL NAVIGATION.

It will be remembered that the Blank Canal Company offered a reward some time ago for the best improvement that could be suggested in locomotion for canal boats, and appointed a committee to decide upon the merits of the various plans submitted. The following extract from the report subsequently made by the committee will be found to possess interest:

In reference to the plan offered by Henry Bushelson—which proposes to run the boats by means of his patent propellor—we may remark that the steam engine with which the propellor is moved would sink the boat; and, even if it would not, the propellor blades, being longer than the depth of the canal, would dig about 500 cubic feet of mud out of the bottom at each revolution. As a mud dredge Bushelson's patent might be a success, but as a motive power it is a failure and his suggestion that the tow-path might be cut into lengths and laid side by side and sold for a farm, therefore is not wholly practicable.

The idea of Michael O'Fluke is that holes might be cut in the bottom of the boat and through these the legs of the mule could be inserted so that it could walk along the bottom, while its body is safe and dry inside. This notion is the offspring of a fruitful and ingenious mind; and if the water could be kept from coming through the holes it might be considered valuable but for one thing—somebody would have to invent a new kind of mule with legs about seven feet long. Mr. O'Fluke's mind has not yet devised any method of procuring such a mule and unless he can induce the ordinary kind to walk upon stilts, we fear that the obstacles to success in this direction may be regarded as insurmountable.

Mr. J. Peterman Bostwick urges that important results might be secured by making the canal an inclined plane, so that when a boat is placed upon it the boat will simply slide down hill by the power of attraction of gravitation. This seems to us a beautiful method of adapting to the wants of men one of the most remarkable of the laws of nature and we should be inclined to give Mr. Bostwick the first prize but for the fact that we have discovered, upon investigation, that the water in the canal also would slide down hill and that it would require about fifteen rivers the size of the Delaware to keep up the supply. Mr. Bostwick does not mention here where we are to get those rivers. He does, however, say that if it shall be deemed inadvisable to slope the canal the boats themselves might be made in the shape of inclined planes, so that they would run down hill upon a level canal. There is something so deep, so amazing, in this proposition, that your committee needs more time to consider and brood over it.

Mr. W. P. Robbins proposes to draw off the water from the canal, lay rails on the bottom and then put the boats on wheels and run them with a locomotive. Your committee has been very much struck with this proposition but has concluded, upon reflection, that it is rather too revolutionary. If canal navigation should be begun in this manner, probably we should soon have the railroad companies running their trains on water by means of sails and stage lines traveling in the air with balloons. Such things would unsettle the foundations of society and induce anarchy and chaos. A canal that has no water is a licentious and incendiary canal; and it is equally improper when, as Mr. Robbins suggests, the boats are floated in tanks and the tanks are run on rails.

Your committee has given much thought and patient examination to the plan of Mr. Thompson McGlue. He suggests that the mules shall be clad in submarine armor and made to walk under water along the bottom of the canal, be fed with air through a pump. As we have never seen a mule in action while decorated with submarine armor, we are unable to say with positiveness what his conduct would be under such circumstances. But the objections to the plan are of a formidable character. The mule would, of course, be wholly excluded from every opportunity to view the scenery upon the route, and we fear that this would have a tendency to discourage him. Being under water, too, he might be tempted to stop frequently for the purpose of nibbling at the catfish encountered by him and this would distract his attention from his work. Somebody would have to dive whenever he got his hind legs over the tow-line and when the water was muddy he might lose his way and either pull the boat in the wrong direction or be continually butting against the bank.

Of the various other plans submitted your committee have to say that A. R. Madkey's proposition to run the boat by sails and to fill the sails with wind by means of a steam blower on the vessel; James Thompson's plan of giving the captain and crew small scows to put on their feet so that they could stand overboard and push behind; William Black's theory that motion could be obtained by employing trained sturgeons to haul the boat; and Martin Stotsbury's plea that propulsion could be given by placing a cannon upon the poop back and firing it over the stern, so that the recoil would shove the boat along; all these are wonderful evidences of what the human mind can do when it exerts itself, but they are not as useful as they are marvelous.—*Max Adeler.*

AN INTELLIGENT MAGPIE.

The Rev. F. O. Morris writes to Land and Water:—"I received the following a few weeks ago from a correspondent. The fact as stated is certainly a very curious one and new to me. I wrote to ask if he had seen the occurrence himself and he replied that he had. It is as follows: 'Finding from periodicals that you are a collector of anecdotes of birds, &c., I have one at your service. Birds are great favorites of mine. I have had several varieties, both foreign and British, for years; among the rest some magpies. One has gone the way all pets, sooner or later, go; the other is still alive and allowed to wander in the garden all day, and goes to her own cage at night when told. She likes running about the sill of the parlor window, two feet six inches from the ground, facing the garden, when there is anybody in the room. Last autumn a dish of peas was left inside near the window. Mag, with her head on one side, viewing them, evidently made up her mind that she ought to taste them, so she began to tap at the window with her beak; but finding the glass was too strong, after flitting backwards and forwards several times and trying each time, she stepped opposite and seemed to think and then hopped on to the path, picked up a gravel stone, came back, and with the stone in her beak struck the glass several times until she had cracked the pane. The noise frightened her and away she went with that peculiar hop and twitch of the tail tame magpies assume when they know that they have been doing mischief. Mag is still alive and goes about the garden as usual.' It is to be remarked that a somewhat similar example of what seems to amount to a reasoning power occurs in the case of the hooded crow—and that a kinder species, too, we must bear in mind—which, as also the crow, is constantly in the habit of soaring up to a considerable hight in the air with a cockle or mussel and then letting it drop on the rocks to break the shell and so get at the fish inside. Sir Charles Anderson once told me that he had frequently seen them do this. Sir Walter Scott used to say that he would believe anything of a dog. We may, I think, believe more in like manner of birds than we have sometimes been in the habit of doing."

LAUGHTER.

This often shows the bright side of a man. It brings out his happier nature, and shows of what sort of stuff he is made. Somehow we feel as if we never thoroughly know a man until we hear him laugh. We do not feel "at home" with him till then. We do not mean a mere snigger, but a good, hearty, round laugh. The solemn, sober visage, like a Sunday dress, tells nothing of the real man. He may be very silly or very profound, very cross or very jolly. Let us hear him laugh, and we can decipher him at once, and tell how his heart beats.

Sabbath Reading.

OUR FIRST GRAY HAIR.

As the first big pattering drops that fall
With a splash on our lattice pane
Make us shiver and start as they warn us all
Of a storm or of coming rain,
So is it with life when we're growing old
And age steals on unaware—
We shiver and start, if the truth were told,
At the sight of our first gray hair.

We mark not the light of the noonday hours,
Like the first streaks the dawn doth bring;
We hail not the birth of the summer flowers
As we do the first snow-drop of spring;
On the bleak winter wind we look not with grief,
Though it howl through the branches bare;
But we sigh when we witness the brown autumn leaf,
And behold Nature's first gray hair.

Gray hairs may come when the beaming eye
Has none of its brightness lost,
When with buoyant heart we would fain deny
Youth's Rubicon had been crossed;
But the ivy-clad tree looks young and green,
Though a sapless trunk be there,
And naught of decay on our cheek may be seen
When we witness our first gray hair.

Oh a noble crown to a noble life
Is a head of silvery gray,
And 'tis well if tired with the struggle and strife
It finds rest at the close of day.
But gray-headed sin is a crownless curse,
And the parent of dark despair,
And it gives us a pang, oh, doubly worse,
Than the sight of the first gray hair.

Come early, come late, like a knock at the gate,
Is that first soft, silvery thread,
And it joins with its silence the years that wait
With the years forever fled;
It silently tells us we're journeying on—
It silently questions us—Where?
Oh a faithful mile-stone, were the truth but known,
Is seen in our first gray hair.

[*Walter C. Howden.*

THE LIFE OF A PASTOR IN LAPLAND.

The life of a pastor in the North is largely occupied with the cares of this life. He has during the summer months to attend to his glebe, and to catch fish, and shoot birds to serve as his winter supplies; and when winter comes he has to drive wood from the forest for fuel, and to travel twice a year to the two spring fairs, which are held at the nearest village. The pastor of Quikkjokk only leaves his post thrice a year, and then his journeys extend no further than Jokkmokk, once to spend Christmas, and on the other two occasions to obtain the necessary supplies, which, if not then obtained, can only be procured afterward at great expense from the coast. Besides his glebe he has a small salary to enable him to eke out his living, and though banished, as it were, from the world, is not uninterested in its concerns, and keeps up, not only that taste for botany which is so common among educated Swedes, but also pays some attention to archæology. His spiritual duties are light, and in summer confined to the preaching of a sermon on Sunday to the few inhabitants of Quikkjokk. On the day after our arrival we we went to the little church, and increased his congregation to twenty-five for that day. The whole service was in Swedish, and did not differ from that in other Swedish churches. He wore the usual dress of a Swedish pastor, viz., a tight-fitting black coat, with a thickly-plaited silk train depending from his shoulders. He also had small bands, and carried in his hand the white pocket handkerchief without which a pastor never appears in the pulpit, and which is twisted round two fingers and allowed to hang over the side of the pulpit. After reading prayers at the altar, over which hung an oil painting representing the infant Christ, the gift of a Swedish traveler, the pastor left the church, and, returning shortly with a Bible and psalm-book wrapped in the white handkerchief, ascended the pulpit and preached an excellent sermon to an inattentive audience.

ALWAYS TRUST.

Worthy and dear brother, know how to carry yourself in trouble. Keep God's covenant in your trials. Hold you by His blessed Word and sin not. Flee anger, wrath, grudging, envying, fretting. Forgive a hundred pence to your fellow-servants, because the Lord has forgiven you ten thousand talents. For I assure you, by the Lord, that your adversaries shall gain no advantage except you sin and offend the Lord in your sufferings. But the way to overcome is by patience, forgiving and praying for your enemies; in doing whereof you "heap coals upon their head," and your Lord will open a door to you in your trouble. Wait upon Him as a night-watch waiteth for the morning. He will not tarry; go up to your watch-tower, and come not down; but by faith, and prayer, and hope, wait on. When the sea is full it will ebb again; and as soon as the wicked are come to the top of their pride, and are waxed high and mighty, then is their change approaching. Now I trust in the Lord that ye shall, by faith, sustain yourself, and comfort yourself in the Lord, and be strong in His power; for you are in the beaten and common way to heaven when you are under the Lord's crosses.—*Rutherford.*

There is no question that it is far preferable to remain under the influence of moderate errors, than to be bandied about for the whole of life from one opinion to another, at the pleasure and support of superior intelligence.—*Sidney Smith.*

Ladies' Portfolio.

WHAT MY LOVER SAID.

By the merest chance in the twilight gloom,
In the orchard path he met me—
In the tall, wet grass, with its faint perfume—
And I tried to pass, but he made no room;
Oh, I tried, but he would not let me;
So I stood and blushed till the grass grew red,
With my face bent down above it,
(How the clover lifted each pink, sweet head,
To listen to all that my lover said;
Oh! the clover in bloom—I love it!)

In the high, wet grass, went the path to hide
And the low, wet leaves hung over;
But I could not pass upon either side,
For I found myself, when I vainly tried,
In the arms of my steadfast lover.
And he held me there, and he raised my head,
While he closed the path before me;
And he looked down into my eyes and said—
(How the leaves bent down from the boughs o'erhead,
To listen to all that my lover said;
Oh! the leaves hanging lowly o'er me!)

Had he moved aside a little way,
I could surely then have passed him;
And would not have heard what he had to say,
Could I only aside have cast him.
It was almost dark, and the moments sped,
And the searching night-wind found us;
But he drew me nearer and softly said—
(How the pure, sweet wind grew still, instead,
To listen to all that my lover said;
Oh, the whispering wind around us!

I am sure he knew when he held me fast,
That I must be all unwilling;
For I tried to go, and would have passed,
As the night was coming with its dew at last,
And the sky with stars was filling;
But he clasped me close when I would have fled,
And he made me hear his story,
And his soul came out from his lips and said—
(How the stars crept out where the white moon led,
To listen to all that my lover said;
Oh, the moon and stars in glory!)

I know that the grass and the leaves will not tell,
And I'm sure that the wind—precious rover—
Will carry his secret so safely and well
That no being shall ever discover
One word of the many that rapidly fell
From the eager lips of my lover,
Shall never reveal what a fairy-like spell,
They wove round about us that night in the dell,
In the path through the dew-laden clover;
Nor echo the whispers that made my heart swell
As they fell from the lips of my lover.

LADIES' SPECIAL OFFER.

On page 256 of this issue will be found an announcement that is of particular interest to the Ladies. This offer of Plants and Seeds should appeal to all lovers of flowers very strongly, and the slight personal effort it will require to secure two rare plants and a package of the seed of the Moluccа Balm will be more than compensated by the enjoyment of these charming, many-hued shrubs, plants and vines. The selections now offered have been grown in the RURAL'S Experimental Grounds for this special purpose, and we may confidently assure the Lady Readers of the RURAL that it will well repay them to carefully read the announcement, and determine to embrace the offer. ED.

ON KEEPING A COMMONPLACE BOOK.

It would be idle at the present day to say anything in favor of books. Ever since books were, the greatest authors of all ages have given eloquent testimony to their inestimable value; they have been praised in prose and celebrated in song, have been collected and arrayed in splendid bindings, and sometimes coffined up by bibliomaniacs as too precious to be put into the hands of mere readers; and they have, alas! been ruthlessly burnt and otherwise destroyed by barbarous conquerors. "Wondrous indeed is the virtue of a true book," says Carlyle; and he only echoes what many a thankful reader and scholar has said before him. Friends may change, and the dreams of youth fade away, but a man who seeks consolation in books will secure companions whose friendship will never fail him, and in whom he himself will find more and more to admire every day. Well might Southey write in the familiar lines—

"My days among the dead are passed;
Around me I behold,
Where'er these casual eyes are cast,
The mighty minds of old:
My never-failing friends are they
With whom I converse night and day."

It is not, however, with books in general that we have to deal now, but rather with one particular kind of book, which should contain within itself the essence of a good many others—that is to say, a Commonplace Book. The dictionary definition of it is a good one:—"A book in which things to be remembered are recorded and arranged under general heads." How many of the readers of this article keep such a book? Those who do will know its value without any explanation, and those who do not may, it is hoped, be tempted to commence such a volume at once. Let us see, then, what a Commonplace Book is. Every one who reads must from time to time be struck with certain special passages—a particular piece of prose, or more than ordinarily beautiful thought in verse, a reference or quotation. It may be—at all events, it is a something which causes the reader to pause for a moment and vaguely wish that the particular passage or thought should not be forgotten. But memory is treacherous, and as other ideas follow which we might like to treasure, the author's words and thoughts very soon slip away from us. Or take another case. We are reading a newspaper, and come upon an article on some special subject of which we have long wished for fresh information. In one part there is a passage which contains an account of an invention which strikes us as well worth remembrance. We read it, and trust to the chapter of accidents to remember it; or we put aside the newspaper for preservation, in which case it is usually lost; or we cut out the passage and pocket it, when a similar fate overtakes the extract. Or again, to come down to more homely matters, you notice in some paper or periodical a good recipe, some hint on household economy or decorative art. You may remember it or you may not; at any rate, some method of insuring yourself against forgetfulness is desirable.

Now in all these cases, and in many more which might be mentioned, what is wanted is a Commonplace Book—that is to say, a good-sized volume wherein any extract which specially takes your fancy can be either copied or pasted, according to circumstances. Captain Cuttle's famous advice, "When found, make a note of," which forms the motto of a periodical Commonplace Book, is admirable advice, and it is astonishing what a valuable collection of extracts, hints, inventions, epigrams and quotations of all kinds a person may gather in a very few years. Of course a certain discretion must be exercised. Many people, on first starting a Commonplace Book, commence to overstock it with all sorts of odds and ends of no particular importance. The volume thus becomes a lumber-room instead of a storehouse of valuables, and is of very little use. Each person, too, will act upon different principles of selection, extracting for various purposes, and with different aims; so that a Commonplace Book would reflect with fair accuracy the bent of a man's or a woman's mind, and the direction of its owner's tastes.

In keeping such a book, two things are essential if it is to be a success. In the first place, copy out your extract or paste it directly you have decided it is worth preserving. If you put it off, the chances are that you will be unable to find the passage when you want it again, or it will be altogether forgotten. In the second place, your Commonplace Book should have a carefully compiled index, and each extract should be indexed under two different headings if possible, for convenience of reference. This, too, should be done when the extract is put in. An index compiled in this way by degrees is easily made, and will probably be an accurate one; whereas if left to be done after the completion of the book, it is troublesome to make, and very likely to contain mistakes. There is no occasion to make it strictly alphabetical at first; a mere classification under each letter will be sufficient for some time, and a rearrangement can easily be made afterwards. It is a good plan to keep the index in a separate volume, for its length can never be accurately gauged, and it is also easier to rearrange. A reference under two heads—the author and the subject for instance, in the case of a quotation—is useful, because in one case you may remember that the author wrote on that subject, and in another you may recall the idea but forget the author. In any case an index is indispensable; in fact, without one you will probably spend more time in searching for your extract than it is worth when found.

It is almost unnecessary to dilate on the value of a Commonplace Book kept with discretion. There is hardly any pursuit in which a man or woman can be engaged that will not at times receive aid from such a volume. There are, no doubt, certain occupations—notably those connected with literature and art—which would benefit most by a Commonplace Book. But apart from its use, such a volume is a source of much pleasure to the possessor as well as to others, and the extracts made in youth will be read with a curious interest in after-life.

FASHION NOTES.

NEW YORK, Oct. 7, 1876.

At this season of the year "Fall Openings" are an epidemic most delightful to us women, who rarely feel any ill effects of the disease—most painful to our husbands, who suffer to an alarming degree. It is clearly the fault of the shopkeepers, however, it being manifestly wrong (!) to arrange dry goods in such tempting array that the money is irresistibly coaxed out of one's purse. I mean to have an illustrated fashion article as soon as I can prevail upon the Publisher of the RURAL to get up the "cuts;" but the poor man is dragooned so unmercifully just now, that I am ashamed to press the matter. However, it will not be long, I am assured, before I shall have the affair in my own hands, if I can only persuade the management that Fashions are an important feature of the Ladies' Portfolio column. Therefore, it rests with you, ladies, to make known your views. If the representation is strong enough, we can, I think, have a Fashion article at least every other week.

This week my notes will be confined to a brief mention of LORD & TAYLOR'S opening. I will omit a description of the unusually fine display of imported model suits until a more convenient season. Their fall importations are now complete, comprising black and colored fancy silks that are excellent in texture and extremely reasonable in price. The house made their purchases before the recent rise in silk and can, therefore, offer undoubted bargains. The Dress Goods department has many novelties in black and colored cashmeres, merinos, all-wool and mixed plaids, including the new Damassee styles, at prices ranging from 10c. per yard upwards. The shawls displayed are very handsome, the patterns of the cheaper broche and British and American woolen shawls being noticeably neat. It is an ever-recurring surprise to me how manufacturers can make up and sell ladies' and children's suits as cheaply as they are now offered.

Handsomely trimmed suits in cashmere, basket cloths, camels' hair, alpaca, and all kinds and degrees of mourning attire, are temptingly displayed. This house furnishes explicit directions for self-measurement that enables the most obtuse in dress-making mysteries to order suits and feel assured of receiving garments that will be satisfactory in every respect. For the convenience of out-of-town customers, they have prepared a catalogue that leaves nothing to be desired, and I cannot do better than recommend my fair readers to send for it, containing, as it does, many hints that are not without their value. I rarely have seen a more complete stock of linens, white goods, upholsteries, furniture, hosiery, gloves, &c., than is exhibited by this firm, and at most insinuating prices. I had time to merely glance at the Carpet department, noticing however, that good ingrains were selling as low as $1 per yard, some qualities being ticketed at 35c.

I wish to say, furthermore, that Messrs. LORD & TAYLOR pack and ship country orders free,—that is, the goods are delivered to the purchaser with all charges paid,—and really, I don't see but that our country cousins, availing themselves of this arrangement, are not even *better* off than Metropolitans, as they can shop as cheaply as ourselves, without any attendant worry. FROLIC.

Reading for the Young.

"MI-CAT INTER OMNES."

MEIN joli cat ist sehr pelit,
Ich liebe ihm und er liebt me,
Und oft er sitzt upon my knee
Und purreth mit the greatest glee.

Enjoying othim in das haus
Vous avez oublie rat kai maus:
Grown oisif, iners, lacking nous,
Depart, ekphonge, geh heraus.

Venez a mol mein liebe cat,
Dulce deems and all of that.
Inflect amo, amas, amat,
Gieb mir das Latin wort fur rat
Und be ein tres-sage, sophos, cat.

His answer ist ein pleasant purr
Quae seems zu sagen, "Oui, Monsieur,"
Mais das ist ownis, his answer
Is nicht in Latin but in purr.

[*The Dartmouth.*

THE CRAB AND THE TORTOISE.

A CRAB of a roving disposition had wandered to the upper margin of the beach, to see what he could see. Very much to his surprise, he descried a creature jogging languidly seaward as if to meet him and concluding, from the general resemblance of the stranger to himself, that they were somehow related, he ventured to accost him by the name of "cousin."

C.—"You must have traveled a great distance, my good cousin," said he.

T.—"Only half an hour's journey, Mr. Crab—no great distance," was the reply of the tortoise, delivered in a low and quiet voice.

C.—"You have the advantage of me; pray, may I ask your name?"

T.—"Men call me 'Tortoise,' but for what reason I do not know."

C.—"You are right welcome, Mr. Tortoise. We are so seldom favored from the land. May I venture to inquire what brings you here?"

T.—"Three things—a slight indisposition, a draught of sea water, and—my own feet."

C.—"Feet? I do not quite understand you. What a hard fighter you must have been in your day!"

T.—"Why think you so?"

C.—"You seem to have lost so many of your legs; and those left you are so out of proportion to your bulk, I conclude that they have each lost a joint at least."

T.—"Not at all, I do assure you; on the other hand, I was just wondering what use you could have with so many."

"Why, you shall see." And the crab immediately began to run backwards and forwards, in a north-easterly and south-westerly manner, to the great amusement of the tortoise. "And look!" continued he, growing quite vain of his fancied superiority, "you may perceive from the print of the crown upon my back, that I am a royal creature."

T.—"Wonderful!"

C.—"Indeed, I begin to pity you more than ever. How, in the name of wonder, do you convey food to your mouth?"

T.—"Why, my good friend, I convey my mouth to my food—that's how I manage. I suppose, Mr. Crab, you are a weaver by occupation?"

C.—"What strange ideas you land people have!"

T.—"Why, we have an animal with us with legs, as you call them, just like yours, which makes its living by weaving."

C.—"A very useful employment too, you must admit, Mr. Tortoise."

T.—"Very useful to itself, Mr. Crab!"

The crab had unconsciously omitted to call the tortoise his cousin for some time, and was beginning to feel that he was in different company from what he had anticipated.

But at this point of the conversation a stone, thrown by a wicked youth, glanced harmlessly from the horny armor of the tortoise and alighting on the crab's back, cracked his crown. All his legs were now in motion and, without bidding good-by to his new acquaintance, he posted with amazing celerity seawards till he reached a cranny of the rocks, in which he hid himself.

The tortoise drawing in his head merely remarked to himself, "How useful a thing it was to be able to run fast!"

THE BOY WHO WAS ASTONISHED.

A FRIGHTFUL runaway took place in the northern portion of St. Louis recently. A large cur came trotting leisurely down the street all in harness and drawing a sled upon which, in a state of supreme bliss, was the enterprising urchin who had conceived the idea of utilizing dog-power. They conducted themselves with a calm dignity, that boy and dog, and when the boy met a couple of other boys of his acquaintance and stopped his conveyance for a chat, there was just a shade of condescension in his manner to those who had to walk. The youth on the sled entered into earnest conversation with one of the boys on the ground and, while the two were thus engaged, the other boy took occasion, unobserved, to pull out a piece of string and attach an oyster can firmly to the dog's tail, leaving interval enough between tail and can to allow the latter a degree of play.

The interview finally terminated and the boy on the sled started up his dog. At the first move the animal discovered that his tail wasn't all right, and at the first rattle of the tin he took in the situation and acted precisely as other dogs have been known to do under similar circumstances. He just raised up his hair all along his back, curled his tail under him, laid his ears over, opened his mouth, struck up something from Wagner, and started! Commodore Vanderbilt, when he takes a special train and travels sixty miles an hour, doesn't make half so good time as that dog did. He straightened himself out and gathered himself up in awful leaps, and when he straightened there wasn't an inch of space between him and the ground, and when he gathered he looked like a horseshoe magnet three feet high. The boy gave one gasp when the dog started and then tightened his grip on the sled; he slid down into the position known among the youth as "belly-buster," and there he stuck. The procession—dog, can, boy and sled—went down the street like a whirlwind, swerving neither to the right nor left. When a wagon crossed the dog's path he flew under it, and on such occasions the boy's hair would flop up like the wig of the end man at a minstrel show. Finally a coal wagon came in sight and it became apparent that it would be a close shave unless the dog turned a little. But the dog never swerved—he was too intent on reaching the end of the world. The wagon didn't cross the street quick enough, there was a crash against one of the hind wheels, and a boy with a bloody nose and one runner of the sled remained in the immediate vicinity, while the dog and the rest of the sled passed into the dimmest kind of perspective.

SPELLING IN OLD TIMES.

IN the reign of Henry V. good spelling and clean shirts were equally rare luxuries. Leicester, says Disraeli, spelled his own name in eight different methods, while the family appellation of Villiers, in deeds and documents relating to the house, is spelled in at least a dozen. Malmwaring passed through 131 orthographical permutations, and is even now, if spelling have aught to do with pronunciation, spelled incorrectly at last. The immortal bard himself, not to speak of what others did for him, changed his own mind some thirty times, according to Halliwell, as to the letters and the sequence of the letters composing his illustrious patronymic. Elizabeth wrote sovereign in as many ways as she knew languages—that is, seven. The young Pretender, following his own sweet will, and entirely free from any servile bondage to the letter, writes of his father as a certain Jems or Gems. In those palmy days, when every man was his own speller, when military examinations were not, little astonishment would have been raised by such arbitrary orthography as lately adorned the paper of a candidate for one of her Majesty's appointments in the line. That candidate spelled elegy *leg*, and ingeniously evolved *pashshinger* out of passenger. Much ingenuity, nay imagination, inspired another, who framed *Indian eras* out of engineers.

But what are such trifling irregularities as these to the caprice of—say her Grace the Duchess of Norfolk? The Duchess was one of the most accomplished ladies of the sixteenth century, the friend of scholars, the patron of literature. She wrote to the Earl of Essex, thus:—"My ffary gode lord,—her I sand you in tokyn hoff the neweyer a glasse hoff Setyl set in Selfer gyld. I prayon tak hit An hy wer hable het showide be batar," &c. The patron of literature has ingeniously contrived to spell *I* and *it* each in two different ways in as many lines. What this friend of scholars intended the Earl to understand by Setyl is very obscure. There is a Scotch word something like it, signifying "a disease affecting sheep in the side," but this the most accomplished lady can scarcely have intended.—*Cornhill Magazine.*

LETTERS FROM BOYS AND GIRLS.

From Cousin Peggy.

DEAR COUSINS:—Please move your chairs a little closer together to make room for me—Miss PEGGY TORSY. Stop laughing at my name—it's as pretty as I can afford to have. If you're going to make all manner of fun of me, I shall take French leave. No I won't, either; I'll stop a while, just to plague you. Although for some time I have wanted to write you, I have kept very quiet for me, listening to the interesting and oft-

times amusing chats of the Cousins; but now I venture to open my mouth to say something. My parents used to tell me it was impolite to *listen* open-mouthed and never say anything myself. They don't tell me that now, but sometimes hint that I ought to close my mouth now and then so my tongue won't get so dry and to give others a chance to express their ideas. However, there is no use trying to keep me quiet forever, when you are all gabbing so for dear life.

As for NEW-YORKER, I hope he does not think his kindly efforts to silence YOUNG TOM were not appreciated. Let us assure him that we did appreciate his courteous remarks and gave him our sincere thanks.

Our Phlox, Petunias, Geraniums, Fuchsias, Candytuft, and all the flowers excepting Pansies and Mignonette, have never blossomed better than this season. The Madeira vines are about ten feet high and budded very full. We always bring them in the house just before they blossom and you can imagine what a pretty decoration they make with their beautiful vines and dainty blossoms. Mother says she must have Madeira vines summer and winter, and she does. But that my letter is already long enough, I would tell the girls about some pretty rugs made of burlaps, worked with canvas patterns of bright colored yarn. Perhaps some of the girls who have made them will tell those who do not know, how they are made. It would be selfish of me to take more space for this letter.—COUSIN PEGGY TORSY, *New York State.*

From a Virginia Boy.

DEAR EDITOR:—This is my first letter to the RURAL and I hope you will excuse my bashfulness, as I have been trying to pluck up courage to write this long time. I live in that rosy, sunny country of old Virginia and I take delight in agriculture. I have good success in budding, grafting, propagating, &c. I have varieties of tame grapes grafted on the wild vine; some of the vines had one stem of grapes on the first year from the graft; the second year they hung full of the largest and most perfect bunches you ever saw. Some of our neighbors wished to know how I managed to raise such large strawberries, grapes, onions, &c. I told them that it was all owing to taking MOORE'S RURAL NEW-YORKER. "Yes," they said, "it was a very good paper; but"——but they are subscribers for your golden paper this year, and their garden is as free from weeds as mine.

Uncle TRUE and Uncle MARK, will you please give us some hints on lost arts, and allow me to ask if welding copper is a lost art? Dear RURAL Cousins, if you will allow me, I think that the Editor is doing his best to make this department very interesting; what say you? I have been wishing the Editor would give us the privilege to have sketches sent from RURAL Cousins to be inserted. Dear Editor, I take pleasure in sending you a sketch of a floral cross that is growing in our front yard; it is admired by every one. I thought perhaps some of the RURAL Cousins would like to try their hand training cypress vines next year. Mr. Editor, as this is my first attempt to write for the press, I hope you will please excuse my poor scholarship and admit me into the circle as one of the RURAL Cousins, as I take great delight in reading the RURAL, especially the letters from the Cousins; so I thought I would send my name in to be initiated and if I am not black-balled, will write again.—WILD GUY.

The Puzzler.

BIBLICAL ENIGMA.

I AM composed of 69 letters:

My 54, 7, 27, 45, 10, 8, 4 a book of the Old Testament.

My 11, 2, 31, 9, 15, 17, 36, 3, 66, 14, 42, 54, 26 books of the New Testament.

My 6, 2, 20, 62, 5, 21, 43, 17, 22, 38, 46, 60 king of Elam.

My 39, 28, 49, 25, 47, 12, 37, 64 an Egyptian.

My 12, 61, 56, 32, 67, 1, 69 a book of the New Testament.

My 56, 63, 68, 19, 10, 33, 37, 18, 24 Esau's wife.

My 38, 31, 29, 41, 48, 57, 61, 44, 17, 30 son of Enoch.

My 34, 57, 40, 17, 58, 33, 37, 60 son of Jacob.

My 35, 50, 36, 55, 38, 3, 66 a wise man.

My 52, 53, 49, 51, 15 a book of the New Testament.

My whole is a verse in Proverbs.

☞ Answer in two weeks. S. C.

DOUBLE CROSS-WORD ENIGMA.

My first is in death but not in life,
My second is in husband but not in wife;
My third is in knave but not in fool,
My fourth is not in horse but in mule;
My fifth is in bleak but not in cold,
My sixth is in silver but not in gold.
My whole forms two rivers of Europe.

☞ Answer in two weeks. BERBIX.

DOUBLE ACROSTIC.

1. A SPIDER'S web. 2. A river of Asia. 3. A river of England. 4. An evergreen tree. Primals and finals form beasts of prey.

☞ Answer in two weeks. LITTLE ONE.

PUZZLER ANSWERS.—Sept. 30.

ILLUSTRATED REBUS.—Now is the time to subscribe for MOORE'S RURAL NEW-YORKER.

MISCELLANEOUS ENIGMA.—Sic semper tyrannis.

CENTRAL PUZZLE.—Vienna.

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.00 for the two, may select any two of the following-named plants and a paper of the seed of the Molucca Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory or garden. Its growth is rapid—small plants attaining the hight of five feet during the summer months. In the fall it may be cut back to any desirable size and potted for the winter, when it will quickly recover its symmetry and resume its ever-blooming habit. Its quick and exceeding popularity is a sufficient guarantee of its merits.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is as yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class. It is difficult to select a more attractive plant than Marie Lemoine when freely blooming. Every truss is in itself a boquet. The leaves are large, zonoless, vigorous. The plant is compact and, like *Abutilon Boule de Neige*, is invaluable, either for the conservatory, window or garden.

Hydrangea paniculata grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It has stood 20° below zero unharmed. It begins blooming in early August, continuing until after hard frosts. The thyrses of flowers, first greenish-white, then white, then rose, often measure a foot in length and twenty inches in circumference. Every stem being thus terminated, the striking appearance of an entire plant may be conceived. There can be no doubt that this is one of the most valuable of all perfectly hardy shrubs.

Variegated Ampelopsis or *Vitis heterophylla variegata.*—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green, much as *Abutilon Thomsoni* is variegated with green and yellow. From its racemes of flowers are formed fruit as large as currants, each one of which is a different color in shades of claret, azure-blue and green. These berries, which are first as soft as a currant, become finally as hard as bullets.

The pretty stems are also variegated, green, whitish and rose. The roots are perfectly hardy, and the vine's growth so rapid that it will cover twenty-five feet square in a season. For conservatory walls or pillars, for trellises or rockeries, it cannot fail to please. It has been growing in the RURAL EXPERIMENTAL GROUNDS for several years without the least protection.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the singular Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

News of the Week.

HOME NEWS PARAGRAPHS.

PEOPLE who don't pay their taxes are not allowed to vote in Georgia.

Piute Indians are swarming into Virginia City, Nev., for winter quarters.

Wages of operatives in the Wilkinsonville, Mass., mills have been raised sixteen per cent.

"We are all Colonels now," says the Atlanta Constitution, "there are no plain citizens left in the State."

The Agricultural Bureau of Georgia costs each citizen a cent and a quarter per year, and last year saved the farmers $559,000.

New York has already raised over $15,000 for the Savannah relief fund. The fever at that city continues without abatement and has broken out with terrible force at Brunswick, Ga. Relief will be needed at both of these points for some weeks to come and the work should not be allowed to falter.

On Saturday, Sept. 30, fishing smacks off New London struck a shoal of mackerel a mile long and a quarter of a mile wide, and took $10,000 worth of fish.

The salmon product of the Columbia river, Oregon, will this year reach the enormous total of 40,000,000 pounds, and the amount canned for shipment will yield $3,000,000.

One of the largest droves of cattle ever seen in any place was driven from Texas a few weeks ago from Capt. King's ranch, Nueces County, to Kansas. The herd numbered 30,000 horned cattle, and was attended by 700 drivers. The outfit alone cost $50,000, and the herd brought $320,000.

Laura Joyce, who became publicly known as an actress in "Leo and Lotus," at Niblo's, was young, handsome, and a good singer. She soon was married to James Valentine Taylor, a wealthy Bostonian, and retired from the stage. Now she sues for a divorce, and returns to theatrical life.

Betsy Grigsby of Lexington, Ga., was incited to pugilism by reading about the fight between Goss and Allen. She believed that she was able to distinguish herself in the same way, and in her first attempt she whipped a woman. Next she decided to try a man; but she did not wish to be too ambitious at the outset of her career, and so chose a decrepit negro over eighty years old. She beat him so badly that he died on the same day, and Betsy is in jail awaiting trial.

A circus that travels in Texas has an uncovered canvas inclosure. At Brackett a tree over-hanging the ring was occupied by men and boys, who thus saw the show free of cost. A performer's feat included firing a revolver on horseback, and at the first discharge a spectator fell dead from the tree. Thereupon the circus men were mobbed and escaped only by a practical use of their skill in horsemanship.

George Winthrop made an ascension in a hot air balloon at Paxton, Ill., and at the altitude of 500 feet, the balloon burst with a loud report, and began to descend rapidly. The wreck formed a parachute and checked the rapidity of descent for a short time, but when about 200 feet high a collapse occurred, and the man shot rapidly earthward, driving his legs into the ground up to the knees. His forehead was cut open and nose broken by the basket falling on him. His back is badly hurt, and it is thought he suffered severe internal injuries which will prove fatal. He was alive at last accounts.

The following is the latest from the war in Europe: "The Standard's Belgrade special says a Russian corps of telegraphers, having a complete apparatus for field telegraphy, has been formed."

A dispatch to the Standard, which is confirmed by a semi-official statement in the Post, says the English Cabinet has made a formal proposal to the Powers for a conference. Russia also urges a conference.

In addition to this, both Powers agree to the necessity of a month's armistice. There is, therefore, reason to hope that Russia and England are not diametrically opposed.

FOREIGN NOTES.

DR. MICHAEL GRAHAM, a London physician now in Madeira, has just made public a most disheartening report as to the present condition and future prospects of the Madeira grape. It seems that the growers who had replanted their *vignolles* after the long-continued blight have enjoyed but a brief respite from the ravages of the pitiless, root-sucking *Phylloxera vastatrix*, which is scattering desolation among the vines more ruthlessly than ever, and the peasants are burning their grape-laden trellises in heaps. Around Funchal there is not, according to Dr. Graham, a single vineyard in a thoroughly sound condition. Meanwhile for "Inland consumption," or to maintain an impossible competition with sherry, desperation, combining with dishonesty, has thrown itself into the fabrication of spurious Madeira, from apples and other fruits, which, "branded to the hill," and disguised with a small admixture of genuine wine, is being bottled and labelled as of "selected growth."

In demolishing the lower wall of the Castle of Dieppe, in France, interesting relics have been discovered, consisting of coins and pottery of different periods. The workmen have also come upon the foundations of the ancient Church of St. Remy, known by antiquaries to have stood near the castle.

Count Von Arnim has been arraigned on a charge of high treason. The judgment of the court is not announced.

There has been an influx of mounted Cossacks into Servia.

Lord Derby advises placing the disturbed Bulgarian districts under a Christian Commission.

The eldest son of Prof. Thorold Rogers, of Oxford, England, an eminent political economist, hanged himself lately in his bedroom. He was eighteen, and captain of Westminster school. The previous day he had been just as usual, made no complaints, and seemed quite contented and happy. No explanation whatever of the act was adduced. His father was abroad traveling.

Although the late Earl of Leven and Melville may have been correctly described as the oldest man among the Peers, he was not "Father" of the House of Lords. In both Houses the "Father" is that member who has sat longest, and Viscount Gage succeeded to this position in the Lords on the death of the late Duke of Leinster in 1874, having been then for 60 years a member of that House.

Prince Charles III. of the diminutive Italian and faro-banking republic of Monaco, being afflicted with a chronic nervous malady, has relinquished his indefinite public duties to his son, Prince Albert, a young man who has served in the Spanish and French navies. Since the conclusion of peace between France and Germany he has cruised in his private yacht to various points throughout the world.

A licensed drover at Brentford, Eng., who, while driving a bull along the road several weeks ago, struck a cat with a thick stick, was ordered to be sent to prison, with hard labor, for a month, without option of a fine.

A census of the Republic of Peru just taken shows the population to be 2,720,735, an increase of less than ten per cent. in fourteen years.

Russia recently gave extensive orders for rifles at Liege in Belgium, and for cannon at Krupp's factory in Germany.

Demonstrations have taken place at Patras, Zante and the Piræus in behalf of the Greek population of Turkey, and urging Greece to make military preparations. This movement is becoming general.

An imperial edict has been published expressing regret for Mr. Margary's murder and affirming the right of foreigners to travel through the country and enjoy the protection of the authorities. An envoy with a letter of apology for the Yunnan outrage is to go to England at once.

The Sheffield Knife grinders are asking for a Protective Tariff.

Arthur Orton, the Tichborne claimant, works on a sewing machine in prison. He is in good health, but is reduced seventeen inches in girth

A trip through India is now easily made by rail.

Thilliet, the French champion bicyclist, completed on Saturday evening, Sept. 23, at Wolverhampton in England, the feat of riding 650 miles on a bicycle in six consecutive days of 12 hours each. He started at 7 o'clock on Monday morning, and up to Friday night had covered 540 miles, thus having 104 miles to accomplish on the last day. He started on Saturday morning at a few minutes after seven, and rode till 11:33, when, having gone 44 miles, he rested for dinner. Starting again at 2 o'clock, he went along at a splendid pace, and eventually completed the distance at twenty minutes to eight.

Dr. Strousberg, who still waits his trial at Moscow, has just published his autobiography at Berlin. This remarkable book contains the personal history of the German railway king, and many important disclosures upon commerce and financial operations in Germany.

Madame Adelina Patti is now in Paris. For the first time in the course of her triumphant career she has been reported in delicate health, and a consultation of physicians was, at last accounts, to decide whether she could fulfill her operatic engagement at St. Petersburg this winter.

British Consul Green, reporting on the trade of Brazilian provinces of Para and Amazonas, states that the crop of India rubber, which was little over 2,000 tons in 1861, has been steadily increasing ever since, and reached 6,763 tons in the year 1875. There are vast rubber-yielding districts which have never yet been touched. The increase in 1875 was less than usual, owing to an exceptionally long rainy season and much sickness.

Georgia, Democratic; majority over 50,000. Colorado claimed by both parties, probably Republican. Majority anywhere from 200 to 2,000.

The freight business of the Trunk Lines is looking up. Large amounts of grain are being sent East.

E. A. Woodward, formerly clerk of the Supervisors of New York, one of the "Ring," has been caught in Chicago.

The N. Y. Chamber of Commerce has passed resolutions complimenting Gen. Newton on his success at Hell Gate.

N. Y. ex-State Senator Hubbard died on Oct. 5, at Norwich.

The Yellow Fever is abating in Savannah.

Snow fell in Canada, Province of Ontario, Oct. 7th.

WEEKLY OUTLOOK.

Shohomish City, W. T.—We have had a very wet summer here; had but little good weather for making hay, and it was nearly all more or less damaged, but the crop was more than an average. We have what is called the "Potato Blight," and from my observation the first indications are a kind of mildew on the stalk; it is, I think, a kind of fungi. In two or three weeks it will show on the lower leaves, but in a different form; perhaps one-third or one-half of a leaf will turn black and die, and sometimes in a week, but generally in about two, the whole piece will look as though it had been struck with a frost. I think the tubers stop growing, but they have not rotted with me in the last three years. It takes the Buckeye first, Early Rose next. Some say those planted late will escape, but I have failed to observe it; this I do know, that early planted, say the last of March, are larger and mature better than the later planted; and it appears that seed potatoes from the East escape longer than seed grown here, and a change of seed from the high land to the bottom is an improvement. Now selling at 75@87½c. ℔ bush.—SIGMA.

Starkley, Ky.—We have had much rain of late but it was needed, as it has been a dry season up to the present time. Grapes have come forward earlier than last season and are much better in quality and yield. Potatoes are poor and the crop light. Prices are advancing; at present they fetch 65c. per bushel, with prospects of a still higher price. The late rains may do some damage to clover seed, as it will be difficult to gather and clean it in wet weather. Buckwheat is filling

slowly and the prospects for a good yield poor. The apple crop will be about half the average on account of twig-blight; but there being a full crop in other apple growing regions, the prices will probably not be affected by losses here. The hog market was opened last week with a carload which sold at 6c., live weight. Butter advancing in price for good grades, there being considerable of low grade in market.—H.

Meramichi, N. B.—The past season has been with us an exceptional one. A late spring kept the preparation of the soil all behind; but when fine weather set in the growth was very rapid and in this County of Northumberland the hay crops are very heavy and were housed in splendid condition. Our summer was hot, very hot, the thermometer ranging for days at from 92° to 97°,10, with long continued drought. The dry weather and heat ripened the oats too soon, and consequently they are a very light crop and straw is short. What wheat was grown was good, but owing to the weevil and rust, our farmers did not raise much of this cereal. The drought also seriously affected the growth especially of early potatoes and turnips, and this year our Early Rose are a very poor crop on that account. Late potatoes appear to be good.

The dry weather still continues, and the after grass in the pastures is kept very short—almost bare. The weather, for the past four or five weeks, has been cold and fall like, the glass varying from 40° to 70°, and on Saturday last touched 32°. Consequently, our woodlands are putting on their gorgeous autumn clothing preparatory to the fall of the leaf. Our salmon fisheries were very successful early in the season, and large quantities were shipped in ice to the United States; but during the latter half of the season fish have been very scarce, and the catch far below the average. Business here is very quiet, and not much prospect of improvement before spring. I think this is perhaps quite as lengthy as you would wish and will close, wishing the RURAL every success under its new management.—A.

SEMI-BUSINESS PARAGRAPHS.

WISNER'S "TIGER" HORSE HAY RAKE has taken the Grand Medal at the St. Louis Fair, over all competitors. This, added to its grand victory at the Centennial, has placed the "Tiger" far in the advance line. WISNER can now shout, and J. W. STODDARD & Co. will find it hard work to fill orders for 1877.

FRANK MILLER'S LEATHER PRESERVATIVE and Water Proof Blacking received the highest and only award at the Centennial Exhibition.

THE RURAL NEW-YORKER wants good local agents. Address RURAL PUB. CO., 78 Duane St.

FRANK MILLER'S HARNESS OIL received the highest and only award at the Centennial Exhibiton.

INQUIRIES FOR ADVERTISERS.

[OWING to the many inquiries from subscribers concerning things that have a commercial value, and are offered for sale through the medium of newspaper advertising, we have deemed it for the best interest of all concerned, to classify our "Answers to Correspondents," so that each inquiry will appear under its appropriate head, either in "Inquiries for advertisers," or "Answers to Correspondents." This, we believe, will enable advertisers to more effectually comprehend the wants of our subscribers, and will enable us to make our advertising columns what they should be—a true reflection of our readers' wants. This department will be edited carefully, it being our aim to use it in the interest of both advertisers and readers (and we shall not hesitate to give our reasons for excluding bad or doubtful advertisements) and such other matter as will be of legitimate interest. At the same time it must be understood that such inquiries as may appear must appeal to the advertiser himself for answer. The advertisement should answer the want and the want is indicative of its need.]

J. T. DUPRE, Texana, Tex., wants "Egyptian Rice Seed." We have had several inquiries for this seed since our article in issue of Sept. 16th.

M. R. J., Niagara Co., N. Y., wants a good factory churn.

H. Y. N., Fairfield Co., wants a good fan separator and grader.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 7, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	81,310	Molasses	—
Whisky	4,300	Rice, bbls	2,223
Corn meal, bbls	2,700	Cut meats, pkgs	10,187
Corn meal, bags	1,215	Lard, pkgs	4,080
Wheat, bush	537,402	Tobacco, hhds	2,532
Corn, bush	843,886	do. pkgs	5,106
Oats, bush	114,037	Butter, pkgs	40,120
Rye, bush	27,823	Cheese, bxs	41,372
Malt, bush	66,371	Cotton, bales	27,503
Barley, bush	155,773	Rosin	11,546
Beans, bbls	7,488	Spts. turp., bbls	1,523
Grass seed, bush	5,697	Dried Fruits, pkgs	3,491
Beef, pkgs	808	Eggs, bbls	6,773
Wool, bales	1,611	Peanuts, bags	1,187
Hops, bales	2,853	Leather, sides	60,000
Pork, bbls	2,742	Sugar, hhds	—
Tallow	1,158	Oil cake	9,92

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done: but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible: mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEANS AND PEAS.—Exports of beans past week, since Jan. 1st, 480,180 do.; same time last year, 259,721. 1,169 bbls.; since Jan. 1st, 47,636 do.; same time last year, 24,024 do. The demand for mediums is not active, but holders and interior shippers have full confidence in the future of the market and demand our full late rates. Marrows have sold quite briskly and the moderate receipts admit the advance quoted. Red kidneys are also doing better. White kidneys have an inquiry; prime new would bring $2. Old stock of the various sorts now coming forward show some pretty rough gleanings. Canadian peas are lower; stock accumulating. Green peas higher. Southern W. E. peas quiet at quotations. We quote:

Beans—New pea, $1.65@1.70; med., $1.50@1.55; marrow, $2.10@2 20; old prime pea, $1.55; fair to good, $1.50@1.40; old prime mediums, $1.40; fair to good, $1.15@1.25; prime marrows, $2.00@2.10; fair to good, $1.85@1 80; prime white kid., $1.75@1.80; other, 1.45@1 60; prime red kidney, $1.70@1.70; other, $1.40@1.50; Lima (Cal.) $2.75@3. Black beans, $2.25@2.50. Canadian peas, bulk and bond, 62½—c.; free bolt, $1.10@1.12. Green peas, $1.20@1.25; split do. $6. Southern W. E. peas (2-bush. bag), $2.25@2.40.

BEESWAX.—There are only small sales at 31@32c5 for Western and Southern. Exports past week 2,30. 6lbs. Since Jan. 1st, 59,305 do.; same time last year, 65,896 do.

BROOM CORN is without important demand; quoted at 6@7c. for short green hurl, 5½@6½c. for green hurl, 4@5c. for medium green, and 3c. for red and red-tipped.

BUTTER.—Export of butter past week 8,000 packages. Supplies continue enormous again exceeding 10,000 packages for the week. The extra grades of butter have held up well, notwithstanding the decline quotations. Prices are out of proportion with the times and there is a diminished trade owing to the limited purchases of buyers who expect more favorable rates, that is a scale of prices that will enable them to invite a larger market or grocery trade. As yet sellers do not fear a sudden decline; they feel that lighter receipts will put stiffness in the market again. We have never advocated swamping the market with stock, but with the possible fine times ahead, we think there should be a steady delivery of butter right along and prices be allowed to settle at a good consumptive movement. The export demand is falling off in its strength, and no longer imparts the solidity that at one time ruled in the lower grades. It may revive if the desired concessions can be obtained, but as a great deal of the surplus. Western here has been bought with a view good exporters prices, holders do not break much as yet, particularly as shippers will not take a very low order of goods.

We quote:—Choice pails, 35@—c.; prime, 29@32c.; poor to good, 25@29c.; creamery pails, choice, 36@37c.; good, 31@35c.; sweet cream pails, 30@33c. State firkins, choice, 33@36c.; fair to good, 29@30c.; do. half firkin tubs, choice, 32@33c.; fair to prime, 25@30c.; do. Welsh tubs, choice, 30@31c.; other, 24@28c.; Western creamery, choice, 34@35c.; other, 31@33c.; do. firkins, best, 29@31c.; other, 15@19c.; dairy tubs, choice, 24@26c.; other, 15@19c.; factory choice, 28@31c.; other, 17@19c.

State dairies quotable at 28@31c. with fall tubs.

CHEESE.—This market is very much unsettled. Strictly fancy September, being in small stock, bring 13½@13¾c; but all other grades are very irregular. Fine August make being obtained at 12½@13¼c., and very good stock obtained as low as 11c. Exporters are not disposed to operate to any extent, advices from abroad indicating a feeling to allow the accumulations to run down before operating further.

Fancy factory, 13¼@13½c. for fancy September; 12¾@12¾c. for fine August; good and prime, 11@12½c.; fair, 9¾@10¾c.; State farm dairy, fancy, 11¾@11¾c.; good to prime, 10@10¾c.; fair and good, 9@10c. Western factory, good and prime, 10@11c; fair lots, 8¾@9½c.; do. cheddar, choice, 11@11¾c.; do. flat, choice, 11¾@11½c. Exports past week, 27,542 boxes.

Gold closes at 109.

Liverpool cable quotation, 55s.

CIDER.—Quoted as before, with a large offering. Small pkgs.. 10@12c.; large do. 8c.

COTTON.—With large arrivals, slow export demand, and a pressure to sell, prices are lower.

The latest quotations are:—October, 10 15-16c.; November, 10 31-32@11c.; December, 11 3-32@11¼c.; January, 11¼c.; February, 11 7-16@11 15-32c.; March, 11¾c.; April, 11 13-16c.; May, 12c.; June, 12 5-32@12 3-16c.; July, 12 11-32c@12¾c.; August, 12½c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9 1-16	9 1-16	9 1-16	9 1-16
Strict ordinary	9 7-16	9 7-16	9 7-16	9 7-16
Good ordinary	9 15-16	9 15-16	9 15-16	9 15-16
Strict good do	10 3-16	10 3-16	10¼	10¼

Stained.

Good ordinary	8 13-16	Low middling	9 13-16
Strict ordinary	9 7-16	Middling	10 3-16

DRIED FRUITS.—For apples there has been some little stir to export demand, which gives a more comfortable feeling; the grades required have been taken at about recent figures. Choice apples are a little irregular in price, as they are dealt in moderately. Peaches and small fruits very dull.

Exports past week 280 packages; Since Jan. 1st, 4,750 do; same time last year 10,000.

Apples—State, sliced, 6¼@7½c.; do., quarters, 6½@7c.; Southern sliced, new, 6@7c.; choice do. 7½@8c.; fancy, 8@10c.; do., new quarters, 4¾@6c. Blackberries, 8@8½c. Peeled peaches, new, nominally 13@14½c.; unpeeled peaches, new, nominal. Plums at 12@14c. Raspberries, 24@26c. Cherries, 10@16½c.

EGGS.—The week has had but few days of activity. Sellers looked for an advance but late rates have not been even supported. There is a small call for limed at 21c. ₱ western.

Near points, 26@26c.; State and Penn., 24½@25c.; Western, prime, 23½@24c.; do. other, 23c.; Canadian, 23½@24c.

ESSENTIAL OILS.—Peppermint—What was previously said about a glutted market is now fully confirmed by large arrivals of Western and State oil, which is offered freely at $2.25 ₱ lb. With few and small sales of spearmint the same can be said; asking price, $2 ₱ lb.—no buyers. Sassafras in fair demand at 45c.

FRESH FRUITS.—The demand for apples is good but receipts crowd sellers, and prices are generally low. Pears are higher. The Sheldon, which gives as much satisfaction as Bartlett in many cases, bring $10@12 ₱ bbl. Quinces are quoted at $8@10, no large offering as yet. The surplus supply of grapes seems to have been sent in and prices are better. Cranberries have a fair baking demand. Chestnuts are lower. We quote apples fancy $1 75@2; mixed, $1.25@1.50; common open heads, 50@75c. Pears Duchess ₱ lb. $7@10. Seckel, $10@15; Virgalieu $7@10; B. Bosa and B. d'Anjou $6@10. California pears $3@4.50 including B. Clairgeon and B. Diel. Cooking $2.50@3. Plums are out

Cranberries, Cape Cod, ₱ bbl. $9@10.25. N. J. crate, $2@3.25; Grapes—Delaware, ₱ lb., 8@9c.; Catawba, 7@8c.; Concord, 4@6½c.; Isabella, 4@5½c. Peanuts, fancy Va., ₱ bush. $1.70@1.75; other $1.10@1.65. Chestnuts, ₱ bush, $4@5. Exports of apples, past week, 4,726 bbls. Hickory nuts $2@2.25.

FLOUR.—There has been a liberal business recently on export account, which has brought the stock of low grades down to a very small amount, and with continued inquiry from this direction prices are higher and strong. The better grades have more attention, and are at steady prices.

Sales at $4.75@5.05 for poor to very choice superfine State; $5.25@5.35 for very common to fair extra do.; $5.40@5.50 for good extra do.; $5.55@5.65 for fancy do., and $5.70@6.50 for fancy to very choice extra; $4.00@5.05 for superfine Michigan Indiana, Iowa, &c.; $5.25@5 40 for shipping extra do., the inside price for inferior, and $5.45@5.50 for choice to very fancy extra do.; common to choice white wheat extras, $5.85@6.50; fancy do. $6.55@7.75; winter wheat, good to choice family $6.00@7.50; round-hoop Ohio, $5.25@5.35, and trade brands of do. at $5.40@6.75; St. Louis, $5.30@6.50 for common to fair extra, and $6.55@8.50 for good to very choice; Minnesota "straight" at $6.35@8.25, and patent at $7.25@9.60; unsound stock at from $4.25@5.25; city mill extra for West Indies at $6 20@6.25; do. English brands, $5.25@5.30; do. trade and family $5.50@8.50; No. 2 at $3.35@4.25. Corn meal—$2.75@3 for yellow Western, Jersey and Pennsylvania, $3.25@3.30 for Brandywine.

GRAIN.—On the foreign English advices wheat advanced 1 to 6c. ₱ bushel and was fairly active, but has ceased at the close 1@2c. Latest sales are of winter red Western at $1.20@1.21½; amber Kansas at $1.21½; new No. Milwaukee spring at $1.27; amber Indiana at $1.20; amber Michigan at $1.30; white Indiana at $1.30; amber Ohio at $1.25; white Michigan, No. 1 and extra, at $1.32@1.32½. Rye at 73@74c, for Western, and 85@90c. for Jersey. State and Pennsylvania. Barley in free supply and lower: six-rowed State, 91@94c.; No. 1 Canada, $1.17@1.20. Corn is in liberal supply and lower; sales at 57@59c. for mixed Western, and 58c. for white do. Oats have been active, selling at 29@32c. for mixed Western, 44@48c. for mixed State, 45@49c. for white State, and 36@48 for white Western.

HAY AND STRAW.—The receipts are very small, and advices from the country indicate probable light shipments forward for the present, farmers being dissatisfied with current prices.

Bale hay is quoted:—Shipping, 60c.; retail qualities 75c.@$1; clover, 55@70c.; salt, 55@60c. Straw is quoted at 75@80c. for long rye; 50@60c. for short rye; 50@60c. for oat.

HIGHWINES bring $1.15 ₱ gallon, with a light stock.

HONEY.—Regardless of the improved quality of new crop, selling prices are still low. White Clover, 15@20c.; buckwheat, 8@12c. for comb in glass.

HOPS.—There is a buoyant and active market for for choice lots, which are 2@3c. better than last week. The parcels sent a fortnight since to the other side, it is reported, have met with much favor, and fresh orders are here more liberal. For the past week, about 2,000 bales have been taken for shipment. The quotations are:

New Yorks, good to choice, new	35 to 38
New Yorks, fair to fair, new	27 to 31
Eastern, new	27 to 33
Yearlings	11 to 20
Olds, all growths	4 to 8
California, new	35 to 38

POULTRY AND GAME.—Live poultry has ruled low. We can now get along without Western in large quantities, as dressed will soon be a feature. Southern poultry is very poor. We quote:

Spring chickens, near-by, ₱ lb., 14@15c.; do. Western, 13@14c.

Fowls, N. J., ₱ lb 14@15c.; do. Western, 13@14c. Broilers, 8@9c.; Turkeys, N. J., 14@16c.; do. Western, 13@14c.; Ducks, N. J., pair, 15c.@$1.12; do. Western, 65@75c.; Geese, N. J., $2.00@2 50; do. Western, $1.37@1.75.

Dressed begin to appear in quantity, but very few lots are of good quality. We quote:

New Jersey turkeys, ₱ lb., 16@20c.. State, 14@19c.; Western, 13@17c. Chickens, dry-picked, 16@20c. N. J. fowls, 13@17c.. State, 14@16c.; Western, 12@15c. Ducks, 18@19c. for prime, and 10@15c. for other. Common turkeys and fowls, 8@10c.

The market shows a further varied supply and prices are reasonable for all but quail, which are scarce. We quote:

Wild ducks, mallard, ₱ pair, 50@70c.; red-heads, 75@87c.; teal and other common game, 35@38c. Quail, ₱ doz.; $2.75@3. Partridges, ₱ pair, 70@80c. Grouse, ₱ pair, 60@80c. Woodcock, ₱ pair, 75@85c. Hare, ₱ pair, 50@65c. Rabbits, 35@40c. Venison, whole, 11@13c.. saddles, 18@20c.

PROVISIONS.—The general market has been quiet; pending results of the new packing, prices are unsettled. Mess pork quoted at $16.80 for spot and October. Dressed hogs at 7¾@8c. Bacon, 9¾c. for long clear; 10c. for short clear. Lard, Western steam at $10.77½ for spot; $10 for October; $10.05 for November; $9.80 for December, and January. Tallow at 8¾c. for prime in hhds. Stearine at $11¾c. for prime Western. Best hams at $20@21. for choice Western. Beef quoted at $8@10 for plain mess, $10@11 for extra mess, $13.50@14 for packet. Tierced quoted nominal for prime and India mess. City extra India mess at $23@24.

SEED.—New timothy is active on export orders, and realize $2@2.10. Clover is scarce, only a few lots of seed offering; quoted at 13c. Rough flax brings $1.41.

TOBACCO.—Kentucky leaf is lower, with very fair supplies and a slow inquiry.

KENTUCKY LEAF—NEW CROP.

	Light.	Heavy.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Oct. 7, 1876.

At Little Falls, for the week ending Oct. 7th, the market showed considerable activity, prices having advanced one-quarter of a cent. Some 450 boxes of farm dairy cheese were delivered and sold at prices ranging at from 10c to 12¾c.; but 11¾@12¾c. was paid for the bulk.

Seven thousand and seventy-one boxes of factory cheese were sold at the following figures: One lot at 14c.; 7 do. at 13¾c.; 1 do. at 13¼c.; 31 do. at 13½c.; 8 do. at 13c.; 3 do at 12¾c.; and 11 do. were shipped on commission. About 100 packages of butter were sold at prices ranging at from 24c. to 30c.; the bulk going at 28c.

We have recent advices from abroad. Our London correspondent says: "The stocks of American cheese in London in agents' hands cleared and the advance freely submitted to. It looks like a further advance of 4s. on that now on passage. Following are quotations:

American, extra fine, 56s.; fine, 52@54s.; English cheddar, 80@86s.; Wiltshire, double, 56@72s.; Cheshire medium, 66@78s.; fine, 78@80s.; Scotch, 60@68s.; Edams, 65@67s.; Derby slices, 60@62s.

Butter is rather easy; quality and condition of that to hand this week good, and sells at quotations, which are as follows:

Cloonmels, 144@150s.; Corks, 138@142s.; Dorsets, 166s.; Jersey, 120@134s.; Friesland, 150s.; Normandy extra, 120@168s.; American and Canadian, 110@120s. ₱ cwt.

BEEVES.—Monday last there was a firm but slow trade in horned cattle; prices ranged from 7@11c. ₱ lb.; weights, 5¼@9 cwt. There were more fair quality steers to hand than we have been able to report for several weeks; quality ranged from poor to fair, with a good top. Wednesday, prices fell off ½c. ₱ lb., with a decreased demand for good-quality beeves; prices were 7@11c. ₱ lb.; weights, 5@10½ cwt. Thursday, trade small, at 6@10½c.; weights, 4¾@8¾cwt. Friday, sales were slow at 7¾@10½c.; weights, 5½@9 cwt. From 54@58 lbs., net, has been allowed; general sales on 56 lbs., net, to the cwt. Spanish lords, direct from the Plains, sold at 7@8½c. ₱ lb., do. fed east of the Mississippi, at 8¾@9c; native steers, grass-fed, 8@9½c.; part corn-fed do., 9¾@10½c.; grade do., 10¾@11c. Dry cows sold at 8¼c. Bulls, live weight, 3½@3¾c. Oxen at 8½@9c.

MILCH COWS.—Sales larger and rather easier. Nineteen cows sold at $40@45 ₱ head; 10 cows at $10@50; 10 cows at $55@60; 7 cows at $60@75—calves always included.

VEALS AND CALVES.—Smooth quality veals sold 7@9¾c.; coarse quality calves at 4@6¾c.; also at $5@13 ₱ head, trade-made rate. State calves sold at 4@6@6c.; Western, 5@6¾c.; State veals, 7@9¼c.; Pennsylvania, 8¾@9c.; Jersey, 8@9¾c.

SHEEP AND LAMBS.—Trade fair in both sheep and lambs. On Monday last sheep sold at 4¾@6c. ₱ lb.; lambs, 5¾@6½c.; mixed flocks, 5@6c. Wednesday, sheep sold at 5@5¾c.; lambs, 6¾@6¾c. Thursday, sheep, 4@6c.; lambs, 5@9. Friday, the markets closed fair; sheep, 5@5¾c.; lambs, 5¾@7c. Jersey ewes sold at 5c. ₱ lb., Pennsylvania sheep at 4¾@5¾c.; Ohio, 4¾@5c.; State, 4¾@5c.; Michigan, 4¾@5c.; Canada, 5¾@6c. State lambs, 5¾@6½c.; Pennsylvania, 6@6¼c.; Kentucky, 5¾@6c.; Canada, 5¾@6¼c.; Jersey, 7c. ₱ lb.

HOGS.—Trade in live hogs as follows: 63 Pennsylvania hogs, weight 141,430 lbs. 6¾c. ₱ lb.; 140 Ohio hogs, weight 33,620 lbs, at 6¾c.; 47 State hogs, weight 13,340 lbs, at $6.65 ₱ cwt; 14 State hogs, weight 3,510 lbs, at 6¾c. City dressed in fair demand, at 8½9¼c. Supply light.

HORSE MARKET.—City trade improved and sales more numerous. Forty-three light harness horses, quality poor, sold at $47@95 ₱ head; 50 ordinary quality do. $125@225; 30 roadsters, with fair trotting action, but not warranted sound, at $285@400; 7 pairs of family carriage horses at $500@525 ₱ pair; 3 pairs English carriage horses, aged, $600@795; 5 saddle horses, poor quality, $100@215; 19 heavy draft horses, coarse quality, $72@190; general sales at $62@85; 7 head do. choice quality, $300@410; 1 pair do. $600.

PERSONAL ITEMS.

THE Centennial A. Ward makes lots of fun.

THE American Press Ass. seems to be Johnson.

DOM PEDRO will stay in England one whole night.

GEORGE ALFRED LAWRENCE, the English author, is dead.

EDWIN ADAMS, the actor, is said to be dying in Australia.

HENRY JEROME BERTINI, the French pianist and composer, is dead.

ELDER EVANS, the Shaker, says that cats are mediums of evil spirits.

FOUR Frenchmen, made prisoners by the King of Dahomey, have escaped.

PROF. HUXLEY is accused of being a railroad deadhead while in this country.

A SLIGHT knowledge of Latin is full permission to trample the English language to death.

PRESIDENT BABBITT of the University of South Carolina has been appointed State Centennial orator.

THREE miners have reached Nevada from the Black Hills, having in their possession $360,000 in gold dust.

DION BOUCICAULT remarks of W. R. Floyd of the Boston Globe Theater:—"He's not a person—he's a poultice."

CLERGYMEN ought to be prepared to die young; but the Rev. Dr. Spear says that they live longer than any other class.

ONE of the men who wrote "Beautiful Snow" has been arrested for stealing. Once he was pure, but he got hungry.

MADAME GIRARD DE GRANDOIGNES, aunt of the celebrated savant and academician Flourens, has just died at the age of 106.

THE street musician of Paris has adopted the piano. We thought that dreadful instrument would come up some day.

THE pretty Miss Waldmann, so successful in "Aida," quits the lyric stage to marry an Italian count, the Marquis di Ferrara.

KING ALFONSO of Spain told the latest soldiers sent to Cuba that "America owes her prosperity to the triumph of Spanish arms."

WE learn from the Burlington Hawkeye that Dr. Mary Walker has been butted by an unscrupulous goat. Now call out the militia.

THE Rev. M. Van Orden, late Presbyterian missionary to Brazil, has been deposed from the ministry on a charge of being a slaveholder.

A LADY named Butler has been nominated for Congress in Massachusetts, says a London paper. The Widow is making a powerful sensation.

A SPANISH proverb says that a paper cigarette, a glass of fresh water, and the kiss of a pretty girl will sustain a man for a day without eating.

MAYOR BRYANT of San Francisco has vetoed a resolution granting permission to the Chinese to play upon musical instruments on their holidays.

THE widow of Jules Janin has bequeathed to the French Academy 20,000 francs for a Triennial prize for the best French translation of a Latin work.

"THERE!" said Jones, as he wrathfully pushed away the pie which his landlady had just served him, "the stuff isn't fit for a pig to eat, and I ain't going to eat it."

THE King of Belgium is endeavoring to establish a penal colony and institution in South Africa, and is in negotiation with the Republic of Transvaal for its capital.

JAMES LICK died wealthy and unhappy. His money made him more trouble than poverty could possibly have caused him. Brethren, let us think of this and be happy.

REV. WM. GOSS, a prominent minister of the New York Conference of the Methodist Episcopal Church and Presiding Elder of the Poughkeepsie District, died in Poughkeepsie.

THE city of Aix, France, is preparing to celebrate its two thousandth anniversary. A statue of the Roman General, Marius, conqueror of the Cimbro-Teutons, is to be erected.

THE Mayor of Villafranca, Minorca, has fined a Protestant school mistress for accompanying some little girls while out walking. He has also prohibited singing in Protestant schools.

ANSWERING the deputation Lord Derby said that equal treatment of Mohammedans and Christians in the security of life and property was England's policy in the war question of the East.

MR. BAYARD TAYLOR is the New York correspondent of the Cincinnati Commercial, a position once strikingly filled by Mr. John Swinton. That paper has a faculty of making excellent attachments.

MISS LOUISA STOPFORD has sent a diamond brooch to be sold in aid of the Servians, and writes that the diamonds were taken from a snuff box given to her late father, Admiral Stopford, by Sultan Abdul Medjid.

CARDINAL red, worn by young girls, in the waning leap year, has the significance of an auctioneer's red flag. All a man wants is a catalogue of the sale, announcing the painter's name and the merits.

THE Danbury News says:—A man on Long Island has received an African ram. It has four horns and is a "sacred ram." How it feels to be butted by a sacred ram none of us know, but it is altogether likely we will find out, if we but patiently wait, and no accident happens to the ram.

NOTHING seems to be known of the character and opinions of Abdul Hamid II. He is an enthusiastic Mahometan; he has but two wives, and he is not in debt; as to his political sympathies every one is profoundly ignorant.

ANOTHER defeat of the Turks. Mr. and Mrs. Turk of Jersey City, undertook to pummel Mrs. Quinn, but when the Servian police came in Mr. Turk's pulse had about failed him, and Mrs. Turk was crying for something good for scalds.

A BINGHAMTON man is suing for a divorce from his wife on the plea that she has a glass eye that is eternally open nights, and the "aspect makes him nervous." He coaxed her to close it with red sealing wax, but that only increased the terror he experienced.

FRANK SANBORN says two hands have evidently put their fingers to the making of "Mary Philbrick," and that one of them undoubtedly belongs to H. H. It was made in the same workshop as the Saxe-Holm stories. It is a real comfort to know everything.

"A DOLLAR is a large price for a watermelon," said a purchaser to a vender of this fruit, as he was paying for one the other day. "You wouldn't think so, mister," said the dealer, "if you had sot on the fence with a shotgun in your hand every night for three weeks watching the patch."

"BY JOVE," said a Yankee, dashing into the railroad telegraph station the other day, "the express train has gone off the big bridge!" "Many killed?" screamed the bystanders. "Not one," replied the other. "She just went on at one end and went off at the other—just as usual."

MR. GLADSTONE paid a very handsome tribute to Eugene Schuyler, and Mr. M. D. Conway says Schuyler, Hilary, Skinner, Forbes and Macgahan have done by their pens what the Servian sword could not do; they have scared the Ottoman Empire from its only stay and support in Europe.

JUDGE SETTLE has settled the question in favor of Governor Vance. He says the latter did not utter the atrocious sentiments attributed to him as his own, but read them in a quotation from Ingersoll's speech. After all Governor Hays was right; the proprieties had better be respected even in politics.

ELIHU BURRITT has a class of young ladies in Sanskrit. Their last exercise was the translation into the old language of "The Psalm of Life." Each copied the entire translation into an album, which was then sent to Longfellow, who acknowledged the receipt in a note thanking them for the "unique and beautiful present."

THE officers of the English fleet, at Besika, loyally observed the birthday of the Duchess of Edinburg September 3d. A foreign correspondent observes:—"Considering that the Duke and the fleet are at Besika Bay to frustrate the plans of the Duke's father-in-law, this celebration of the daughter-in-law's birthday has an interest all of its own."

A GENTLEMAN in the provinces sends his son to Paris to study law, and gives him a letter of introduction to an old friend, a theater manager. The manager replies promptly, "My dear friend, I hasten to reply to yours introducing your son. I have done what lay in my power for his good—refused him admission behind the scenes at my theater.

BYCICLE accidents are becoming frequent in England. A few days ago Edward Suggate, aged nineteen, while riding down an incline near Lowestoft, was thrown over the front of his machine. On rising to his feet, he remarked to a companion:—"That's a funny topple, isn't it? I can't draw my breath." He then laid down and died within fifteen minutes.

JOSEPH WARREN, editor of the Buffalo Courier, died suddenly Saturday week. He was one of the most active and prominent Democratic politicians in the country, was a member of both the State and National Executive Committees, and President of the State Associated Press. He was a man of genial manners and much public spirit and was every where highly esteemed.

IT appears, from the number of chairs that "Washington sat in," now on exhibition at the Centennial, that the father of his country sat down 29,876 times during the revolutionary war, and each time in a different chair, many of them being patterns of 1875. This explains the entry in Mrs. Washington's journal which has mystified everybody. "Oh, if I only knew where I could get something to reinforce George's trowsers with that which wouldn't wear out in less than two weeks."—*Hawkeye.*

A YOUNG man fresh from college undertook to address a political meeting, and, pointing to a fellow with no collar on, and a beard of three days' growth, said, "Look at yon son of toil." The person apostrophized replied, with animation that he wasn't going to stand there and hear his mother's fair fame aspersed. "Take that back!" he shouted; and, before the astonished orator had time to take it back, he was assaulted with a beer mug.

Musical Instruments.

Implements and Machinery.

Centennial Year of American Independence.

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the sale of the Celebrated Watches, same opportunity bring you manufactured by our country-men, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION, These Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, fine Ruby Jeweled, set in Chaton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.
